In answer to the Wisconsin man's question will say that no man in the breeding business can afford to stay away from the Graham Scientific Breeding School, not only on account of the knowledge gained, but it gives him the confidence and prestige of the people, also increasing his business and enabling him to take the lead in his line of work.—W. C. Lillis, Kay County, Okla.

I would say to the Wisconsin subscriber that it would be the most profitable thing that he could do to attend the Graham Scientific Breeding School, as it certainly is a success.—Albert Aldridge, Cass County, Mo.

I think the gentleman from Wisconsin will find it time and money well spent, if he attends the next term of the Graham Scientific Breeding School. No up-to-date breeder or mare owner should miss it.—T. P. Heffern, Woodson County, Kas.

In answer to the question of the Wisconsin subscriber will say, yes, it is profitable to anyone to attend the Graham Scientific Breeding School, if he is interested in horses either as a mare owner or a stallion owner. More especially if he is interested in better horses.—Jas. E. Romine, Douglas County, Ill.

I am in receipt of my diploma from the Graham Scientific Breeding School. Since taking a course in this school, I am convinced that the time is at hand when no man can expect to make a complete success in live stock breeding, without first taking a course in scientific breeding and then adopting the capsule system, which is the only one that has been proven a complete success.—S. S. Mouse, Linn County, Kas.

I will say to any prospective student, attend the Graham Scientific Breeding School. You owe it to your community. The more you know about the business the better for you. You can learn more at one term of the school, "according to your ability to absorb the lectures," than you can in several years at home without these instructions.—A. T. Ling, Weld County, Colo.

There is no other place on earth where they offer as much knowledge for the amount of money as at the Graham Scientific Breeding School and I can heartily recommend it to all farmers and breeders of stock.—William M. Anderson, Hancock County, Ill.

In regard to the question of the Wisconsin subscriber would say it would pay him or any man who has a stallion or a pair of mares to breed, or anyone who is for the improvement of live stock, to travel across the United States and attend a term of the Graham Scientific Breeding School. The only thing that is wrong about the School is the tuition price. I have attended two terms and would not like to miss one term a year for two hundred dollars. The more I go the more I am interested to hear the able instructors deliver their lectures and answer questions. I am coming in November and expect to see the largest class that has ever attended.—F. H. Moorman, Dickinson County, Kas.

I do not think that the Wisconsin man could spend his time and money to any better advantage than to attend the Graham Scientific Breeding School. I have intended to be present at more terms but was situated so I could not go, but I will make a great effort to attend the next one and will try to bring others with me.—L. P. Kessler, Johnson County, Iowa.

For the benefit of the Wisconsin subscriber will say it would be profitable for anyone who owns six or eight mares, aside from the benefits of the scientific methods, to attend the Graham Scientific Breeding School.—Chas. H. Smith, Carroll County, Mo.

I have had good success in my breeding business, since I attended the Graham Scientific Breeding School. I have trebled my business without buying any more breeding stock. I only use my horse and jacks one service a day and find they settle the mares better than when I used them twice a day. The capsule system is a success when one knows how to use it.—W. H. Hager, Harper County, Kas.

I believe it will pay any stallion owner to take a course at the Graham Scientific Breeding School. To be able to detect diseased mares and keep your stallion from being infected is well worth the time and expense, besides the hundreds of other things a man learns there.—L. R. Hunt, Marshall County, Ill.

Like any other graduate of the Graham Scientific Breeding School I will answer the Wisconsin subscriber that he won't throw his money away by attending the School. He will get value received whether he is a mare owner or a stallion owner.—W. A. Mathes, Linn County, Mo.

I do not see how the Wisconsin subscriber can afford to miss the Graham Scientific Breeding School. It will pay bigger returns on time and money spent than anything I know of. I think every man that has a horse or jack or even a bunch of mares should go to this School. If he is not satisfied it will not cost him anything. I would be pleased to meet every horse owner in the country at the next term of the School.—J. B. Coates, Osage County, Oklahoma.

I do not think any man ought to stand a stallion or jack without first attending the Graham Scientific Breeding School. What I learned at the School has been worth many times the cost to me. I think it will be well for the Wisconsin man to attend the School before it is too late and before spring.—J. W. Wertz, Ottawa County, Oklahoma.

In answer to the Wisconsin subscriber will say to make a success of any business one should be proficient in it, by knowing it and how to do it. I therefore recommend all breeders to attend the Graham Scientific Breeding School. It is efficient and worthy of patronage, and you will certainly obtain a great fund of information.—S. S. Morgan, Madison County, Iowa.

Anyone in the horse breeding business cannot afford to miss attending the Graham Scientific Breeding School one term and learn the many things that will make his running expenses less and his income much more. I say, one term, for that is sufficient, for after ending one term he needs no encouragement to get him back at other terms.—Harry A. Weaver, Fayette County, Ill.

It is profitable for anyone to attend the Graham Scientific Breeding School who has a pair of brood mares, not to say anything about a stallion or jack owner. How can one expect to get the best results from any business without knowing the best way to carry it on? I have used the capsule system this season for the first time with good results, but there is a great deal to learn in the breeding business besides the capsule system breeding. I want to be at the next term.—T. J. Cunningham, York County, Neb.

The instructions and demonstrations at the Graham Scientific Breeding School cover the entire field of horse breeding so completely and are so plain and practical that any intelligent stallion or jack owner can easily understand them and become an expert breeder. The question as to whether or not it be profitable can only be answered in the affirmative.—H. Heckmann, Cedar County, Mo.

The Wisconsin subscriber cannot spend his money for anything more profitable in the horse breeding business than to attend the Graham Scientific Breeding School.—O. W. Layson, Calloway County, Mo.

I have been in the breeding business for fifteen years and thought I knew a lot, but when I attended one term of the Graham Scientific Breeding School, I found out that I did not know much about breeding. I cannot put on paper what I learned in that term. It began to work on me and four months later I took another term and still I learned more. I intend to attend more terms if I can possibly find the time.—Fred Oetinger, Clay County, Kansas.

I know that it would be a benefit to anyone who handles stock to attend the Graham Scientific Breeding School. I have attended three terms and expect to go again. One term is worth many times what it costs to attend.—A. M. Goodheart, Russell County, Kas.

I will say from experience to the Wisconsin subscriber, if he is going to remain in the horse business he cannot afford to miss attending the Graham Scientific Breeding School. It has increased my business so that I think it was the best eight days' work I ever did. I expect to attend two terms this winter and will show my book with any breeder in the business and I figure my success arrived from attendance at the School.—Lew Jones, Wabaunsee County, Kas.

I would say to the Wisconsin subscriber that I do not think he can invest so little money anywhere and get as much in return as to attend the Graham Scientific Breeding School, as he will learn many things there in the one week that would take years to learn any other way. With this knowledge and practical experience he will be able to compete with other progressive breeders.—J. C. Stevenson, Appanoose County, Iowa.

Will say I have attended the Graham Scientific Breeding School and find it a wonderful school for those in the breeding business. By following the methods taught there and using the capsule system you can dispose of half of your horses and jacks, do a larger business and show more foals than before.—E. H. Leas, Labette County, Kas.

I would advise the Wisconsin subscriber to attend the Graham Scientific Breeding School by all means, no matter what it costs him, if he is a breeder or a mare owner.—E. R. Thomas, Pueblo County, Col.

Any man who stands a horse or jack ought to attend the Graham Scientific Breeding School. He cannot afford to miss it. It is the greatest school I ever saw or heard of for the stock raiser. Every farmer ought to attend at least one or two and as many more terms as he possibly can. No man ought to be allowed to stand a horse or jack unless he first attends this School and learns all about the infection of diseases. It will help the best to attend.—Barney Lott, Alfalfa County, Okla.

I think if the Wisconsin man is a stockman he can't afford to miss the Graham Scientific Breeding School. He does not know how far behind the times he is until he goes and takes a course.—J. R. Brooks, Randolph County, Mo.

I attended the Graham Scientific Breeding School one term and am going back again. Anyone owning a stallion or jack can multiply his profits ten times by taking advantage of what is taught at this School.—M. E. King, Butler County, Kas.

I would like to say a word for the Graham Scientific Breeding School. I think a man could afford to cross the continent to attend one term, if he expects to be a breeder. I know it has benefited me that much.—J. E. Gibson, Neosho County, Kas.

I have attended two terms of the Graham Scientific Breeding School and am greatly pleased with it. It would pay anyone who is raising horses to attend, whether he kept a stallion or not. I will gladly answer letters from anyone wanting to know about the School.—Frank Conway, Guthrie County, Ia.

Will say to you or anyone who wants to take up the breeding business, it will pay you to take up the scientific way of breeding and the only way I know is to go to the Graham Scientific Breeding School. There you will get your money's worth.—G. W. Murray, Lawrence County, Ind.

I consider my term at the Graham Scientific Breeding School the best investment I ever made.—A. R. Kendall, Kiowa County, Kas.

If the Wisconsin subscriber owns a stallion or even a few mares and has never attended the School, it would undoubtedly pay him to do so. There is some specific information on scientific horse breeding given at the Graham Scientific Breeding School that is difficult to get any other way.—Ernest Clawson, Butler County, Ohio.

The knowledge obtained at the Graham Scientific Breeding School has put my business in the lead in this county and the first show of six colts gotten by capsule method.—R. R. Pittis, Harrison County, Ohio.

Tell the Wisconsin subscriber to go to the next term of the Graham Scientific Breeding School with hands and feet. It will be a great honor for him to be the first scientific breeder in his community and he will never be sorry for it. Otto Fritsche, Brown County, Minnesota.

I would say to the Wisconsin subscriber, attend the Graham Scientific Breeding School by all means. Since attending I have had splendid success. I have good horses and would not trust them to any man not a graduate of this School. What a man learns in any one of the different branches will more than pay him. You can't afford to stay away.—E. P. Harris, Wood County, Ohio.

Will say to the Wisconsin man that the School is all that it is claimed to be. There was nothing misrepresented. I would not think of keeping a stallion without attending this School. I find the more you know about the horse the easier it will be for you at the School.—E. Springer, Marion County, Ind.

There is no question whatever but what the Graham Scientific Breeding School is a success. To attend this School is the proper move for any live stock breeder to take. No man is qualified for the business without the aid of this School.—E. A. Carter, Greenwood County, Kas.

Is it profitable to attend the Graham Scientific Breeding School? If one wants knowledge, yes. If he thinks he knows all about breeding, yes. If he does not know enough, yes. If he wants more profit, yes. If he is a blockhead, no.—Ira Porter, Fulton County, Ill.

I think it would be profitable for the

One person in a full bed, 60c per day Good restaurants in connection and nearby. Take Observation Park street car from in front of Union Depot direct to our corner. Only a few minutes' walk to the school building.

Wisconsin subscriber to attend the Graham Scientific Breeding School, if he is handling stock and if he is a breeder he can't afford to miss it. I got enough out of the horse judging part alone to pay me.—W. G. Taylor, Chautauqua County, Kas.

I think anyone raising horses should attend this School. I feel well repaid for the term I attended and want to come again in November if possible.—Geo. W. Stouffer, Custer County, Neb.

In answer to the subscriber's question will say, yes, it will be profitable to attend the Graham Scientific Breeding School. If he is raising stock of any kind that has any value to it or if he wants to be a first class hired man, it will pay as he will be worth enough more to command better wages. —P. H. Highswonger, Woods County, Oklahoma.

I attended the Graham Scientific Breeding School and can truly say that I do not think a man can afford to stay in the breeding business unless he does attend the School and keeps up with the times. I learned more at the School than I could ever hope to learn from experience.—M. N. Reed, Phelps County, Neb.

In answer to the Wisconsin breeder's question, "Is it profitable to attend the Graham Scientific Breeding School?" would say: Every breeder should attend this School or quit the business, as under the old line he would be a detriment to successful horse breeding. This School is doing more for the breeder than all other combined efforts of anyone or anything in the past.—Chris. J. Weiterer, Logan County, Ark.

I think it will pay the man who wants to raise stock to attend the Graham Scientific Breeding School. It will pay him many times.—Benton McKay, Barton County, Mo.

As to the benefit of the School, will say it will pay any man to attend the School for he can learn more in one week there than he can learn in ten years at home. Any man who is in the horse breeding business will be greatly repaid by attending the meeting. I am seventy years old and am out of the horse business now.—J. D. Smith, Randolph County, Ill.

I attended the September term of the Graham Scientific Breeding School. I thought I knew a good deal in regard to breeding but I learned a great deal more by attending this School. I would advise any man having a stallion or brood mares to attend. I think this School is a great help to the country.—Julius Labantsching, Madison County, Illinois.

In reply to the Wisconsin breeder will say if he has a horse worth keeping at all, he certainly cannot afford to miss taking a course in the Graham Scientific Breeding School. Not only take the course, but follow out its teachings in detail. I can say from experience if he follows the teachings, he will certainly make a good investment. —E. H. Steele, Woodson County, Kas.

Anyone intending to keep a stallion one season cannot afford to miss a term at the Graham Scientific Breeding School and if a man wont take the course himself his patrons should positively refuse to patronize his horse and take chances on this barren mare disease, which is gaining on us in spite of all the precautions we can use and seems to be fatal to the breeding qualities of the mares. While the capsule system is a success and the only way to do breeding, it is only a very small item to be learned at the School. All stallioners should surely attend—A. A. Thompson, Green County, Ill.

It certainly has paid me to attend the Graham Scientific Breeding School. I have derived much benefit from the one term I attended and wish I could attend more. Everything at the School is made so plain one cannot help but learn.—G. H. Blum, Blackhawk County, Iowa.

I attended the Graham Scientific Breeding School last October and think it will pay any breeder to attend. He will learn things that he never thought of. A man can double his profits. I can say I am well pleased with what I learned at the Graham Scientific Breeding School and would advise all breeders to attend.—W. B. Diehl, Webster County, Mo.

In answer to inquiry as to whether it pays to attend the Graham Scientific Breeding School will say I never spent a like sum of money that I consider did me so much good. If I would take $1,000 for the knowledge I consider I would be the loser. The knowledge gained at this School reaches farther and higher than the breeding question and no one will attend this School without being better equipped for life's problems. — A. Colegrove, Crawford County, Kas.

I wish to say to the Wisconsin subscriber to be sure to attend the Graham Scientific Breeding School. It was the best spent money that I ever spent in the horse business. After you have learned to tell diseased and barren mares be sure and do not breed them. I attended the first term of the Graham Scientific Breeding School and expect to attend the next term.—C. A. Luce, Decatur County, Ia.

Will say that a man in the breeding business cannot hope for success without scientific knowledge of same. Graham Scientific Breeding School was my preference.—Bert O. Sherrill, D. V. M., Vermillion County, Ind.

I certainly do think it profitable to attend the Graham Scientific Breeding School, not only profitable but a necessity to all first class stock men.—N. C. Cunningham, Washington County, Arkansas.

If the Wisconsin subscriber is in the breeding business for all there is in it, I am satisfied it will pay him well to attend the Graham Scientific Breeding School. If he follows the instructions closely he cannot fail but make good. I was at a colt show a few days ago, where the scientifically bred colts took first and second places and natural service colts third place.—W. E. Reynolds, Iowa County, Iowa.

"Sure Mike," that Wisconsin man should attend the Breeding School. It is the only place to go for the best instruction, and no horseman can afford to try to do business without it. The American Breeder and the School will qualify any man who wants to get ahead in the horse business.—N. P. Mayhew, Cherry County, Neb.

Will say in regard to the Graham Scientific Breeding School, that every breeder should take at least one term of the School. I do believe since most the states have passed stallion laws there ought to be a law that every owner of a stallion or jack who stands them for public use should be compelled to have a diploma from the Graham Scientific Breeding School.—Jacob Mauer, Montrose County, Col.

If a horseman is interested in the improving of live stock he cannot afford to stay away from the Graham Scientific Breeding School. A man don't really know how much it is worth to him. I think so much of it that I expect to attend every year.—N. S. Cox & Sons, Daviess County, Mo.

In answer to the Wisconsin subscriber, I should think it would be worth while to attend the Graham Scientific Breeding School, if he intends to keep breeding stock, if he has nothing but a pig and a rooster. I would not take anything within reason for what I learned at the School, if I did not intend to keep breeding stock. If I had to go back to the old way of breeding, I would sell my stock and quit the business. I have increased my business one-third this season and I have made a good showing, my stock is in good shape and my males are showing up good. I can't say too much for the School.—H. N. Highfill, Greene County, Ark.

I believe it will pay any man who keeps a stallion or jack, either for his own use or for public service, to attend the Graham Scientific Breeding School.—A. J. Wing, Wichita County, Kansas.

I have never regretted the money that I spent attending the Graham Scientific Breeding School. I am sure it is profitable for anyone who handles horses. Anyone who attends the School will never regret it. I got my money's worth and ten times over.—W. C. Bush, Ellsworth County, Kas.

I think any man, either a breeder or a farmer, will be well paid for time and money spent going to the Graham Scientific Breeding School, as he will learn things there he can't get anywhere else.—C. K. Barnhart, Wabash County, Ind.

I can say to the Wisconsin subscriber that I think it very profitable for anyone interested in the breeding business to attend the Graham Scientific Breeding School. The time will soon be upon us when all up-to-date breeders will be using the capsule method. One day at the School is worth more than the School costs.—Geo. E. Hineman, Lane County, Kas.

In answer to the Wisconsin subscriber, I don't think anyone in the United States keeping stallions for public use or in private stud can afford to miss a course in the Scientific Breeding School. I would say the same for anyone keeping a band of brood mares. The value of the instruction to horsemen is beyond estimation.—F. D. Fruin, Iroquois County, Ill.

In reply to the inquiry of your Wisconsin subscriber, you can tell him for me that he will make no mistake by attending the Graham Scientific Breeding School. The time and money spent there will bring him much larger returns for the amount invested than any other investment he ever made in the breeding business. It cost me about $200 in time and money for the time I was there and I am sure I got a bargain if it cost me $500. I hope there will be another term early in 1913, if so I am going again. If it were for nothing else than the training on diseased mares I got, my time and money was well spent. I am sure that is the greatest trouble we have in the breeding business and it could be almost entirely done away with if we all followed the instructions of the Breeding School.—A. J. McLarty, Remsey County, N. D.

Anyone following horse breeding could not afford to miss the Graham Scientific Breeding School, because everything is taught and made so plain on the breeding question that it is worth anyone's time and money and I think it would pay the mare owners as well as the stallion owners. Why it pays to attend the School: They teach the barrenness of mares, the diseases of the sexual organs and the method of the capsule system. I am very sorry that I cannot attend every term.—John A. Weaver, Effingham County, Ill.

I consider my time well spent in attending the Graham Scientific Breeding School. I would not do without the information gotten from the February and September terms if I were not in the stallion business. I feel that no one is doing so much for the horse industry as the School.—Wade Harvey, Marion County, Iowa.

If the man from Wisconsin is interested in live stock it will pay him to attend the Graham Scientific Breeding School. He does not have to own stallions and jacks to get benefit.—C. G. Finley, Lincoln, Mo.

I think it will pay any mare owner to attend the Graham Scientific Breedin School, whether he has a stallion or not.—J. T. Watson, Ralls County, Mo.

My trip to Kansas City to the Breeding School has repaid me many times and I think the School should be patronized by all stallioners, as more can be learned at one term than by several years' experimenting. Do not waste time and money in that way. Plan to attend next term.—Chas. Irvine, Polk County, Iowa.

I would say to the Wisconsin subscriber that it will pay him or any other man who is in the breeding business, or who has a few mares, to be enlightened on many things.—F. S. Adams, Cowley County, Kas.

I cannot say too much in praise of the Graham Scientific Breeding School. I am the only one in this part of the country who has attended the School and I am doing all I can to have others attend. No stallioner can have good success until he has attended this School. I have got just double the mares in foal this year that I did last year and I owe my success to the School and the capsule system.—G. L. Coit, Jr., McKean County, Pa.

In answer to the Wisconsin subscriber's question in regard to attending the Graham Scientific Breeding School, will say I consider it well worth any man's time and expense. I have had good success with the capsule breeding since attending the School.—B. A. Christmas, Eddy County, N. M.

I consider I have made a success of scientific breeding which I learned at the Graham Scientific Breeding School. I am expecting to attend a term this coming winter and would advise all men in the breeding business to attend. —L. M. Laflen, Vernon County, Mo.

I attended the School some two years ago and find it worth many times the tuition price. Every breeder should attend this School.—W. B. Emison, Lafayette County, Mo.

I can highly recommend the Graham Scientific Breeding School to your

(Continued on page 16.)

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.

American Breeder Still the Best.

To the American Breeder:—During the past month or two we have been using two or three other publications along with the American Breeder in our advertising. So far, however, the results from the American Breeder continue to be better than from any other paper we have used.—Shaw & McCuistion, Kansas City, Mo.

LAND DEPARTMENT

FOR BUYERS, SELLERS, TRADERS

Four Cents Per Word Per Month pays for advertisements under this heading, which are set solid in small type, as per style shown.

In case larger type or display is wanted, the rate is $2 per inch per issue.

Cash with order for amounts under $2.

THE BIGGEST BARGAIN OUT.

40 ACRES FOR ONLY $300.

Forty acres 3 miles from Belleville, a good town on the main line of the Rock Island Lines, 5 miles from Danville, the county seat, 8 acres cleared and in cultivation, 20 acres or more can be tilled, the balance for fruit or pasture, branch bottom and upland (not hilly), about 15 acres of ridge land with a north slope which would make a fine orchard; a good deal of this land is level and clear of rocks, but as a whole it has some surface rocks in spots; 3 room box and log house; barn and hen house; good well of soft water; one-half mile to school; near the main line public road; good level roads to town; good out range for stock; good neighborhood and in a very healthy location. Price only $300 cash; no trades; title perfect; possession given any time. If you want this place wire or write me to hold it until you can come to look at it. This place will be sold quick and you had better act now. If you can't come I will send the deed and abstract to your bank with draft attached. **John D. Baker, Danville, Yell County, Ark.**

SOUTHEASTERN KANSAS.

We can prove to you Southeastern Kansas furnishes more natural advantages for a less number of dollars than any spot in the United States. We should be pleased to furnish you a copy of our Southeastern Homeseeker. It's free. Good lands, well located, at from $30 to $75 an acre. Terms easy. Some lands to exchange for lands in other locations or for merchandise. What have you? Are you in the market for a home or an investment? If so, address, **Allen County Investment Co., Iola, Kansas.**

BARGAINS IN LARGE TEXAS RANCHES.

112,000 acre sheep ranch; well improved; $3.00 per acre; 30,000 acres grass land; well watered and fenced; $3.00 per acre; 48,000 acres grazing land; well improved; $4.00 per acre; 10,000 acre tract, 75 per cent agricultural land in artesian belt; $10 per acre. Exceptionally good terms and will take good income property for 25 per cent of purchase price on any of the above. **Cord C. Smith, 125 No. Kansas Ave., Topeka, Kas.**

PARTNER OR BUYER WANTED

for 460 acres; ample free water right; fully equipped with stock and implements worth $6,000; good house and barn; controls 20 square miles summer range; will retain one-half interest if desired. Price $65 per acre. Terms. **T. A. Bisby, Boise, Idaho.**

LAND AND BREEDING STOCK WANTED.

Imported black French draft stallion to trade for Belgian stallion, or good jack; two yearling jacks for older jack, or stallion, or big jennet jack. Want small ranch South Colorado or North New Mexico. **B. L. Wilson, Haddam, Washington County, Kansas.**

SMALLER FARMS WANTED.

Several large ranches to exchange for smaller tracts of land. Will carry balance on land. A chance to increase your operations without any more capital. Send full description in first letter; state where you want to go. **Shaw & McCuistion, 910 Grand Ave., Kansas City, Mo.**

THOMAS AND RAWLINS COUNTY land equities to exchange for stallions and jacks or small Eastern Kansas farms. Correspondence solicited. **A. T. Loomis, Rexford, Kas.**

REAL ESTATE—CONTINUED.

A Good Eastern Kansas Farm

of 157 acres; 50 miles south of Kansas City; well improved, for sale or will trade for registered horses. Address Box 16, Paola, Kansas.

"REAL ESTATE WANTED."

Sell your property quickly for cash, no matter where located; particulars free.—Real Estate Salesman Co., Desk 9, Lincoln, Neb.

AN IMPROVED AND SEVERAL RAW QUARTERS

of good land for sale or trade for stock or anything worth the money. Jos. J. Ernesti, Goudyville, Hyde County, S. D.

98½ ACRES OF LEVEL LAND

for sale near Waverly, Virginia. Address owner, Box 51, Okeana, Ohio. R. F. D.

FORAGE IN PORK PRODUCTION.

To the American Breeder:—At the Missouri experiment station it was found that, with forage crops such as clover, alfalfa, rape, rye grain, cowpeas, soybeans, blue grass and sorghum, a saving of more than 30 per cent was effected in the amount of grain needed to produce a pound of gain in hogs.

As to the kind of grain to feed on forage, when the pasture is a legume, straight corn has given good results. On other forages the corn should be supplemented with some of the high protein feeds. In the experiments at the Missouri station, when the forage was not alfalfa, clover, soybeans or cow peas, a ration consisting of corn 6 parts, linseed oil meal 1 part was fed.

The number of hogs per acre of forage will be variable, of course, depending upon the kind of forage, the season, etc. The figures usually given are as follows: Red clover, 6 to 10 hogs for 3 or 4 months. Alfalfa will pasture from 10 to 25 head per acre; it should be so pastured, however, that one or two cuttings of hay may be made per year in addition to what the hogs eat. Blue grass will support 8 to 12 head per acre for five months. Green rye, 10 to 12 head for eight weeks, and ripe grain from 10 to 12 head from 5 to 8 weeks. Cow peas and soybeans will ordinarily provide feed for 8 to 12 head for 5 to 8 weeks. Rape grows very vigorously if season is favorable and will furnish forage for 9 to 12 head for 8 to 10 weeks. A little oats and some clover sown in rape will give best results. Corn to be hogged off when mature will feed 10 hogs for 5 weeks or 30 hogs for 2 weeks when the yield is about 50 bushels.

The following table gives the results of three years' work with forage crops at the Missouri station and indicates a more economical method of producing pork than by dry lot feeding:

Value of Forage Crops Per Acre.

	Lbs. pork accredited to forage per acre.	Value of acre of forage—(pork @ 6c).	Value of acre of forage—(pork @ 7c).	Value of acre of forage—(pork @ 8c).
Bluegrass.	295.2	$17.71	$19.66	$23.61
Alfalfa.	596.8	35.71	41.77	47.74
Clover.	572.2	24.11	40.05	45.77
Rape, Oats and Clover	294.0	23.64	27.58	31.52
Sorghum.	370.5	22.23	25.93	29.64
Compeas.	224.9	13.16	15.74	17.99
Soybeans.	183.1	10.99	12.81	14.64
Corn.	395.2	23.71	27.66	31.61
Rye Grain	244.3	14.16	17.10	1954

While the above table shows that forage crops may be economically utilized by swine, the fact that the crop is fed off on the ground should not be overlooked.

Because it has been comparatively easy in the past to make money with hogs, it is easy to overlook some of the details of the business and thus let some of the profit which might come from producing pork, slip away. By paying more attention to the breeding operations and thus producing a better animal, by decreasing the cost of the product at weaning time and by feeding more economically from weaning time on, the profits will without doubt be increased. Some of the ways of bringing this about have been briefly indicated in the above. These are only some of the ways, however. Closer attention to each part of the industry is the thing needed.—L. A. Weaver, Department of Animal Husbandry, Missouri College of Agriculture.

AMERICAN BREEDER BOYS CLUB COLT EXHIBITION.

Second Prize Story—Class for Boys 13 to 17 Years Old.

(Told by the Colt.)

"To the American Breeder:—I was in a nice clean box stall with nice sweet straw when I first opened my eyes. On the ground outside there was snow and the wind was blowing cold for it was the 12th of March; my mother and I were all alone all night; when it came day some boys came in and played with me; they named me Star and went away; they did not come back until night, for they went to school. I was sorry, for they petted me and fed me sugar. One night I got out in the snow and when they

ASA HEPPERLY AND HIS REGISTERED PERCHERON COLT.

got me in I was very cold. When the snow was gone they let me out; I was a month old and could run very fast. There were some other horses in the same pasture. In May they had more colts and we had lots of fun running and playing. My father's name is Collector, No. 60152; my mother's name is Netitia, No. 69936; my name is Star, No. 88035. I weighed 620 pounds when I was four months old; that is when my picture was taken; it is my master at my head. My owner took us to the Madison County fair; I was very tired after the long walk but when they gave me the blue ribbon, I felt well paid for my journey.—Asa K. Hepperly, Madison county, Nebr.

WINNERS IN CLASS FOR BOYS 9 TO 13 YEARS.

First Prize—Marion Merkle, Iroquois county, Illinois.

Second Prize—Chas. H. Ross, Greene county, Illinois.

The first prize entry will be presented in the next issue.

FREE POULTRY LECTURES.

To the American Breeder:—A free lecture course on poultry is going to be had at several points in this state this fall and winter. Do you want these lectures delivered in your town or county? This is the result of a $250 donation by D. M. Green, president of the United Publishing Co., of Waterville, N. Y. This series is to be known as the Poultry Husbandry Lecture Course, held under the auspices of the State Poultry Board. It is a recognition of the good work done by the poultry experiment station of this state, as only one or two other states will receive such donations. The State Poultry Board will add perhaps $1,000 more to defray the expense of these lecturers.

Poultry raising is a great industry in Missouri. The Missouri hen produces ten million dollars more each year than the Missouri beef steer. She produces sixteen million dollars more each year than all the lead, zinc, iron and other minerals of the state combined.

Any individual, commercial club, poultry association, or other organization interested should write or send their invitation to me at Mountain Grove, Mo. I am now endeavoring to secure the best speakers available and arranging dates and making other necessary arrangements for the course. You will have to hurry if you wish to secure the benefits of this course for your county. There are hundreds of farmers, farmers' wives, boys and girls, and other poultry raisers in your county who can have the benefit of this course if somebody will put forth just a little effort.—T. E. Quisenberry, Missouri Poultry Experiment Station.

PLANS AND PROGRESS FOR NEW NATIONAL EGG LAYING CONTEST.

To the American Breeder:—Twenty varieties of poultry have already been entered in the second National Egg Laying Contest to be conducted at the Missouri State Poultry Experiment Station of Mountain Grove, Mo. The contest starts November 15.

Each variety is to be represented by 30 hens, making 600 hens for the varieties already entered. These pens come from England, Canada, and the United States. An additional 100 hens will be used on the outside to try out a breeding and feeding experiment along with the regular contest, the hens being trap-nested, records kept and the reports made each month. For this experiment, one contestant, from California, sends one pen of hens which he claims to have been so bred that he guarantees them to average 220 eggs each if no deaths or sickness takes place in this pen. He is to also send two males, one bred along the same lines as these females and the other one he claims is not bred to lay. The first of these males is to be used in the pen with these bred to lay females for a certain length of time, the eggs hatched and the chicks marked and the pullets from this mating to be trapnested the following year. This male is to be removed and the poor one later placed in the same pen with the bred to lay females. The eggs from this mating are to be hatched, the chicks marked, and the pullets trapnested. He claims that the pullets from the first male but from the same females, will lay twice as many eggs as the pullets from the second male, showing that the laying qualities of a flock depend more upon the breeding of the male than upon the female. The result of this test will be awaited with interest.

The feeding experiment will consist of ten pens, each pen being composed of five Buff Orpingtons and five S. C. W. Leghorns. We use these two varieties so that we can note what effect the different feeds have upon the large and small breeds. Each of these birds are bred from the same pen, are the same age and about the same weight. The ten pens will

YOUR CHOICE OF 400 STOVES ON TRIAL FREE FOR 30 DAYS

Pick out *your* stove from the 400 in the Kalamazoo Stove Book—test it FREE for 30 days—return it if not all we claim. That's our offer. We pay freight both ways—give you 360 days' approval test—$100,000 Bank Bond Guarantee and all on latest improved stoves—glass oven doors, etc.

each be fed a different ration as follows:

No. 1—Cornell laying ration.
No. 2—Maine laying ration.
No. 3—Guelph, Canada, laying ration.
No. 4—Connecticut laying ration.
No. 5—Savior's laying ration.
No. 6—Farmers' ration.
No. 7—Feed all kinds before fowls at all times.
No. 8—Grain fed by Norwish automatic feeder.
No. 9—Confined for the entire year and result compared with free range.
No. 10—Green bone and meat, compared with dry beef scraps.

The exact formulas for each method will be announced later. This will make 700 hens in the next contest and the result obtained from these ten pens will be announcer each month with the regular monthly report. Other interesting data will be collected, and every effort will be made to make the next laying contest of great value to the entire poultry praternity.—T. E. Quisenberry, Superintendent, Mo. State Poultry Exp. Station.

SCIENTIFIC HORSE BREEDING.

(Continued from page 13.)

Wisconsin subscriber, where a breeder or a stallioner will learn how to detect barren and diseased mares, as this kind has always been a detriment to the breeder and undoubtedly to the stallion. I have refused to breed thirty-four diseased out of 200 total mares this season. The largest percentage of these thirty-four diseased mares which I refused were bred by other inexperienced stallioners early in the season and they are still at it trying to get them in foal. They may gladly have the pleasure. I also have a number of good capsule colts to show.—H. H. Bohne, Manitowoc County, Wis.

I can say to the Wisconsin breeder that there is no reason why it would not be profitable for him to attend the School, as it is the only place in America where a man can learn anything about horse breeding unless he is like lots of others that think they know it all anyway without any teaching.—E. E. Hall, Anderson County, Kas.

I attended the Graham Scientific Breeding School in 1910 and found it to be of great benefit to me. I think it is the only money making way of horse breeding.—H. P. Wicklein, Randolph County, Ill.

I can say that the Graham Scientific Breeding School has advanced me more than twenty-five years of experience could have done. I would advise anyone contemplating success in the breeding business to attend by all means.—E. O. Lynn, Woodson County, Kas.

I certainly think that it will pay the Wisconsin subscriber to attend the Graham Scientific Breeding School. I do not think he could invest his money to a better advantage than to attend the school.—James E. Kash, Vernon County, Mo.

In reply to the gentleman from Wisconsin who wishes to know if it would be profitable to attend the Graham Scientific Breeding School, will say that to make a success of any business one will have to study that business and as this school is the only school of its kind in the world and is thoroughly practical and up to date, I do not see how a man could afford to not attend this school. If he should not be satisfied that he got value received, his tuition fee will be refunded. What could be fairer than that?—George J. Stoll, Logan County, Ill.

I would say to that Wisconsin man that it will surely pay him to attend the Graham Scientific Breeding School. It will pay any man, who is in the breeding business, tenfold of what it costs him.—T. E. Collins, Republic County, Kas.

Any man whose business is breeding horses would be very much benefited by attending the Graham Scientific Breeding School. I intend to go back for another term just as soon as possible.—E. H. Parvin, Hodgeman County, Kansas.

I think it would pay any man who handles stock of any kind to attend the Graham Breeding School. I would not take many times what it cost me for what I learned while attending the School.—H. Wagoner, Chase County, Kansas.

In regard to the breeder attending the Breeding School, I would advise anyone having stock to attend. I had a three-year-old stallion this year and made my first service May 23 and on July 5 he ran a spike in his foot and I had bred 162 mares, only making three services a week. Twenty-three was the most I bred in one day and if I had not attended the School I would have bred some diseased mares the second day I bred, which would have cost me more than the price of attending the School.—John F. Ratliff, Clark County, S. D.

I will say to the Wisconsin subscriber that he or any other horse breeder will never regret time and money spent in attending a term of the Graham Scientific Breeding School. It will be worth hundreds of dollars to him and his customers.—Chas. H. Clancy, Washington County, Mo.

I do not know what the Wisconsin subscriber is, whether a stallion owner or just a mare owner. If either I think it is the best proposition he could invest in. It is the best thing for the farm a man can invest in. I want to come to the November term if I possibly can make arrangements.—Isaac Kauffman, Dickinson County, Kas.

I have attended the Graham Scientific Breeding School and I surely think it will pay anyone who is interested in the breeding business to attend at least one term.—S. J. Holmes, McDonald County, Mo.

In answer to the Wisconsin man's question, it would be profitable to any breeder to attend the Graham Scientific Breeding School and learn to be able to recognize diseased mares.—J. B. Robertson, Pratt County, Kas.

In regard to the Wisconsin subscriber's inquiry would say, no man can go wrong attending the Graham Scientific Breeding School, if he owns a horse or a good span of mares. I increased my foal crop 15 per cent the first year, after attending the school, and settled all of my own mares this year. I am not bothered with navel ill any more. It is worth his time and money if anything could be.—C. S. Chase, Custer County, Neb.

I would gladly say to the Wisconsin subscriber that he cannot afford to miss attending at least one term of the Graham Scientific Breeding School. There is more to be learned at one term of this School than can be obtained in a lifetime otherwise.—Henry King, Huntington County, Ind.

I would highly recommend the Graham Scientific Breeding School to all farmers having breeding stock. I think every breeder is standing in his own light when not attending the School. I will say that I learned more at one term of this School than I learned in twenty-five years of experience in the stallion business.—L. C. Davis, Putnam County, Mo.

I would advise any man who owns four good brood mares to attend the Graham Scientific Breeding School and that as a business proposition. A man who owns a stallion or jack should not even stop to question but go at once and if he should not learn anything except the examination of mares and to be able to tell if they are in breeding condition he would be paid for his expenses several times over in one season. Besides the great possibilities there are in sight by the capsule system.—C. Stahly, Seward County, Nebraska.

As to the Wisconsin man, I will say that it will pay any man who breeds horses, and especially if he keeps stallions or jacks. The only question in my mind is, how he can afford to miss it. It will pay him 100 cents on the dollar sure. Do not hesitate.—D. O. Orr, Shawnee County, Kas.

In regard to the Wisconsin man coming to school I will say if he is a stock breeder of any kind and especially a breeder of horses, he should by all means go to the Graham Scientific Breeding School. The sooner he goes the better he will like it, because he does not know what he loses until he goes. Any day of the School is worth more than the tuition and there are six days, all good ones. Meeting other breeders is worth a good deal, besides the schooling. Yours for bigger and better horses and success to the School and the American Breeder.—L. R. Lee, Greene County, Ill.

Replying to the question, will say it certainly pays to attend the Graham Scientific Breeding School. A man gets many times the value by attending. The information received makes one more capable to handle the breeding business. I expect to come the next term again and I will try to bring some one with me.—Wm. Raetz, Geary County, Kas.

Replying to the Wisconsin subscriber's letter to the American Breeder, as to whether or not it would pay him to attend the Graham Scientific Breeding School, will say if you are in the horse or jack breeding business, no matter how small, it will pay you to attend the School. I have been in the horse business for about twenty-five years and I learned more at one term of this School on the breeding business than I picked up all of my life before. In fact, I learned that I did not know anything. I have met with men who have attended this School from nearly every state in the union and have never seen one who was not well pleased by so doing. The more knowledge we gain in behalf of our business the more we are worth to our customers and country and of course the more profit to ourselves. You will find the School to be just as the American Breeder represents and if you ever attend, I am sure you will learn to love and appreciate the same. With success to the American Breeder, its readers and the Graham Scientific Breeding School, I am H. S. Record, Eddy County, N. M. —Advertisement.

ORGANIZED IN 1886. PIONEER IN ITS LINE.

The Indiana and Ohio Live Stock Insurance Company

Crawfordsville, Ind.

KKK MEDICINE CO., KEOKUK, IOWA.

Alfalfa has been cultivated since long before the Christian Era, having been introduced in Greece 490 B. C. It was brought to America in the sixteenth century.—Illinois Farmers' Institute Bulletin.

ADVERTISING BRIEFS

DATES FOR PUBLIC SALES.

PERCHERON HORSES.

Dec. 10—W. S. Corsa, Whitehall, Ill.
Dec. 12—J. H. Decker, Piper City, Ill.
Dec. 19—J. C. Robison, Towanda, Kas.

SHIRE HORSES.

Dec. 12-13—Truman's Pioneer Stud Farm, Bushnell, Ill.

BELGIANS AND PERCHERONS.

Dec. 13—D. K. Roth, Gibson City, Ill.

SHIRE, BELGIANS, PERCHERONS.

Dec. 17—Lee Bros., Harveyville, Kas., at Manhattan, Kas.

SHORTHORN CATTLE.

Nov. 13—C. S. Nevius, Chiles, Kas.; H. H. Holmes, Great Bend, Kas.; Ira Berkey, Louisburg, Kas., and Geo. Wedd & Son, Spring Hill, Kas.

A Shorthorn herd bull that has proven itself a good breeder will be included in the sale held by C. S. Nevius and others at Ottawa, Kas., November 13. This bull is a roan, two years old, and bred along Scotch lines. He won sixth in class at the American Royal Live Stock Show, and the only one of his calves old enough to exhibit got in the money at the same show. This bull is catalogued as Brawith Heir 351808.

A. Latimer Wilson, importer of Creston, Iowa, writes that he has plenty of two-year-old Percheron colts that weigh 1800 pounds and over. Also, Belgians three years old, that weigh over 1900 pounds; one bay Belgian, six years old, that will weigh 2365 pounds. If you want extra good imported Belgian or Percheron stallions, write A. Latimer Wilson of Creston, Iowa.

J. M. Young of Fall River, Kas., writes as follows about the stock he is offering for sale: "I have some good Durocs, Bronze turnkeys, Barred Plymouth Rocks and Brown Leghorn chickens and an extra show boar by my herd boar, Fall River Wonder, and out of a Choice Goods bred sow. They can't be beat."

Auto Fedan Hay Press Company, Kansas City, Mo.: I take pleasure in saying the press I bought of you is a first class success. Baled 10,000 bales with it and it is all right. Charles B. Metcafe, San Angelo, Tex.

C. W. Babcock, Walford, Ia., starts his advertising in this issue. Mr. Babcock's last importation of Belgian and Percheron stallions has just arrived and he is anxious for all who are interested in stock of this kind to come and see them.

John W. Waddell, proprietor Pioneer Stock Farm, Brashear, Mo., writes: Will land a good shipment of stallions at the Pioneer Stock Farm by first of the month consisting of Percherons, Belgians from two-year-olds to five-year-olds. They are as good as ever shipped to Adair county. Any man wanting something good at the right price can get them here as Mr. Donham of Maysville, Mo., has been looking for two years for a good Percheron horse and found it right here. Sold him a fine three-year-old Percheron colt and after he landed him he as well as every one that saw him was more than satisfied. That is what makes our sales good—is satisfied customers. Will be very glad to show our horses to anyone whether he buys or not.

J. A. Tuttle of De Soto, Mo., has some good saddlers that he wants to sell at private sale. Mr. Tuttle is closing out and must dispose of these horses by December 15. Here is a chance for anyone wanting stock of this kind to buy them at very reasonable figures.

Bell Bros., of Wooster, Ohio, writes: Our fall importation of 52 head is now thoroughly acclimated and we have beyond question the most complete selection of Percheron and Belgian stallions and mares that was ever in our possession at one time. The horses that arrived in the best condition were exhibited at a number of the leading fairs this season and were highly successful, winning many firsts and championships. Those attending the international this year will have an opportunity of seeing a good sample of both our Percheron and Belgians, as we are planning to take an exhibit to Chicago that have the quality, size and reputation. We call particular attention to these horses of those who want something more than ordinary at a medium price.

George T. Poage of Garrison, Mo., is offering out of season price on fourteen jacks and jennets. If you are in the market for stock of this kind it would pay you to investigate what he has.

Read the ad in this issue of H. J. Turner, Emden, Mo., and if you are looking for a trade he could undoubtedly please you.

F. M. Lorimer of Olathe, Kas., is advertising six jack colts, five trotting bred stallions and one Percheron stallion for sale in this issue. Here is a splendid opportunity to buy worth the money and at very reasonable prices. Write Mr. Lorimer and get full particulars.

The Blue Valley Stock Farm, Blue Mound, Kas., start a new ad in this issue. Dont fail to see it. They won eleven prizes on their horses at the American Royal this year. This is a splendid place to buy Percheron or Belgian stallions and mares, as they sell them at farmers prices.

J. E. McWherter, Plymouth, Ill., is advertising three Shire stallions for sale in this issue. See the ad and then write for full information.

Write to Ben Siefers, Claflin, Kas., if you are in the market for a Percheron stallion, either registered or grade. He has them worth the money.

E. D. Holton, Perry, Mo., will hold a public sale of jacks and jennets at Perry on Thursday, November 14. If you are in the market for stock of this kind it would pay you to attend the sale. See what the ad says about it.

A trade worth investigating is advertised in this issue by Jos. J. Ernesti, Goudyville, S. D. Read the ad.

J. J. McNiff of Luverne, Minn., is offering his prize winner Percheron stallion and a span of imported mares for sale in this issue at bargain prices. If interested do not fail to write him.

Leon Hurless of Sutherland, Iowa, is advertising an imported Percheron stallion for sale in this issue, also a good feed barn, hack line, etc. He may have just what you are looking for. See the ad.

Joseph Trimmer of Anita, Iowa, is advertising an imported Clydesdale stallion for sale in this issue. He wishes to dispose of this stallion immediately and will sell him very cheap. See the ad.

Two Belgian stallions, both state fair winners, are advertised for sale by C. W. McDermott, Wiota, Iowa. If you are interested he will send you a photograph. See what his ad says.

Another bargain is offered in this issue by G. Y. Dutton of Sigourney, Iowa, in the way of stallion and jacks. The ad gives full description. Don't miss it.

Henry Dreher of Cedar Rapids, Neb., is advertising two extra good Percheron stallions for sale in this issue. It would pay any one in the market for stock of this kind to get in touch with Mr. Dreher.

Any one in the market for Chester White hogs should not fail to write B. M. Boyer & Sons Farmington, Iowa. They have some good ones. See the ad in this issue.

A bargain is offered in this issue by C. G. Welsz, Palmyra, Mo., in the way of a stallion and jack for $1,150. See the ad.

If you want a good trotter stallion, C. A. Howard of Woodville, Okla., is advertising one in this issue. See the ad.

Don't miss the advertisement in this issue of John D. Baker, Danville, Ark. Here is a chance to get a farm of 40 acres for $300. Think of it; doesn't that sound like a wonderful bargain? The ad gives full particulars.

Percheron stallions and a jack are offered for sale in this issue by Wm. Dees, Covert, Kas. Mr. Dees is going to leave the farm and will sell this stock at a sacrifice. Read the ad.

"As a matter of fact, there is but one such company in existence that has demonstrated its right to be classified among the successful and permanent live stock insurance companies. That is the Indiana and Ohio Live Stock Insurance Company, Crawfordsville, Ind.—The Spectator, New York.

If you want to buy a farm close to Kansas City there is a good one advertised in this issue by "Box 16," Paola, Kas. This farm is only 50 miles from Kansas City. See the ad.

If you are in the market for registered draft stallions or mares, do not fail to read the advertisement in this issue of E. P. Hamilton & Sons, Garden Grove, Iowa.

C. R. Traux of Cimarron, Kas., has a bargain in the way of a Shire stallion advertised for sale in this issue, or will trade for cattle. See the ad.

Five jacks and four jennets are advertised for sale in this issue by J. Mathany, Bado, Mo. Read the ad and if you are in the market for stock of this sort, write him for further particulars.

Wilder Carpenter & Sons of Marmaduke, Neb., are advertising Poland China and Duroc Jersey pigs for sale in this issue. They also have two good stallions and a jack that they wish to dispose of; they are sure breeders and sold for no fault; Mr. Wilder states that his hogs and farm take up all of his time and he cannot properly care for them. Write him for full particulars.

Two mammoth black jacks are advertised for sale in this issue by J. L. Hensley, Prague, Okla. If you are looking for a good jack it would pay you to investigate these.

If you are in the market for a stallion, it surely would pay you to investigate what Frank L. Stream of Creston, Ia., has for sale. His ad starts in this issue.

Read the ad in this issue of C. Stahly, Milford, Neb., and if you are in need of a stud colt get in communication with him for further particulars about the colts he has for sale.

Fisher & Walker, the well known importers of Evansville, Ind., start their ad in this issue. They have American and standard bred horses which they are pricing right and at terms to suit purchaser. If you are in the market don't fail to read their ad and then write them for further particulars.

A good Morgan stallion is advertised for sale in this issue by B. H. Nelson of Sutherland, Ia. If you are in need of a stallion do not fail to write him.

C. W. Higginbotham & Sons of Rossville, Kas., are offering for sale 38 head of coming three year old mules; all this stuff will do to work next summer; they are mostly out of draft mares and all are sired by big bone mammoth jacks, such as Eastern Kansas has been using for several years. Any one looking for a money making bunch of stock to feed this winter should take a look at this stock as Higginbotham & Sons are pricing them where there will be a mighty good chance for a man to buy them and sell out in teams to the farmers in the spring and net a fine profit. Rossville is on the main line of the U. P., 84 miles west of Kansas City.

The achievements of W. S. Corsa's peerless $10,000, Percheron stallion, Carnot 66666 (66666), constitute one of the most remarkable pages in the world's history of draft horses. Beginning with his winning of the breed championship at the Paris show, Carnot followed it, in the same season, by capturing the purple ribbon on this side of the water in all the more important exhibitions of draft horses from Madison Square Garden to the International at Chicago—including both. When the show season ended he crowned his achievements by selling for the world's record price to his present owner. Has Carnot made good as a breeder? In the most noteworthy show held this year, for determining the relative merit of breeding stallions (the "futurity" at Des Moines), Carnot colts won first and second for stallions, and first, second, third, sixth, eighth and eleventh for fillies. In each ring 18 or 20 colts were shown, but every Carnot colt led out got in the money, as given above, and the only Carnot weanling shown (a stallion) won first in its class. The first Carnot colt ever shown in this country won first in six of the leading state and national shows and then sold for $1,000. The point we are making is that W. S. Corsa's public sale of Carnot Percherons to be held at White Hall, Ill., December 10 ranks for importance among the premier events of the year. Read the advertisement in this issue and write Mr. Corsa at once for a catalog, mentioning the American Breeder.

In another column of this issue of the American Breeder, mention is made of the Bushnell Horse Show held this year October 17 and 18. This is one of the most remarkable showings of draft and pleasure horses made in America, and yet it began a few years ago as a private enterprise. J. G. Truman, manager of the Pioneer Stud Farm, at Bushnell, Ill., started this show, and at the barns of this company there is a horse show every day of the year. The Pioneer Stud Farm is in fact the nucleus from which has been developed one of the greatest draft horse producing sections of this continent The class of Shire, Percheron and Belgian stallions which this firm imports, the business methods which it follows and the fame of its horses as prize winners wherever shown, needs only the help of the magnificent farming country surrounding Bushnell to bring about the results we have already mentioned. The neighbors of the Pioneer Stud Farm are its best friends and its most constant customers, and everybody knows what that means. We are proud to call attention to the advertisement of this firm which begins in the present issue.

We ask that all of our readers who write the Kalamazoo Stove Company, Kalamazoo, Mich., for catalog or information about the superior stoves which this firm sells direct to the user, to mention the American Breeder in all communications. The Kalamazoo Stove Company make a special effort to learn the source of every inquiry, and every friend of the American Breeder will want to see this paper get whatever credit is due it. The stoves are worthy in every way.

"Lamer's 80 Percherons"—did you see the advertisement? Just a collection of 80 Percherons, nearly, if not all; imported stallions, worth first consideration from every buyer within reach. Here is a live firm that brings them over by the scores at a time—and brings them good enough to show, too. Read the show record for this fall—the firm name is C. W. Lamer & Co., Salina, Kansas. Always mention American Breeder.

On December 12, J. H. Decker, of Piper City, Ill., will sell an offering of 41 head of Percherons, very largely imported animals. There are eight stallions from two to four years old and 33 mares and fillies, 23 of which are imported, while all mares are bred to imported stallions. The imported animals in this offering were brought over last May and are thoroughly acclimated and in prime condition for usefulness. The sale will be in town under cover and visitors at the sale can easily get to Gibson City, Ill., for the sale of Mr. D. K. Roth on the day following. Write J. H. Decker, Piper City, Ill., for catalogue and mention the American Breeder.

The last of the big December series of draft horse sales in Illinois will be that of D. K. Roth, Gibson City, Ill. His sale is December 13 and his offering consists of 45 imported Percheron and Belgian stallions and mares. The offering is selected from three importations, and as the last importation in the offering will have been in this country four months at the time of sale, everything is in good shape for the winter and for profitable use as breeders in the hands of the purchasers. For a catalogue of this important sale address D. K. Roth. as above, and mention the American Breeder.

We notice the name of J. E. McWhereter, Plymouth, Ill., as winner of five or six prizes in the Bushnell Horse Show held at Bushnell, Ill., in October.

A car load of Shorthorn bulls and a car load of Shorthorn heifers are advertised for sale by H. C. Lookabaugh, Watonga, Okla.

One of the earliest importations made this season from Europe was brought over by Dr. W. H. Richards, the leading veterinarian of Emporia, Kas. These horses were personally selected by Dr. Richards and are young, sound, reliably bred and good in size, bone, action and color. Dr. Richards guarantees every horse he sells and sells them in condition to make good on his guarantee. Some of his horses are worked in the harness every day. The horses range in age from two to four years, one of the oldest being a magnificent seal brown Belgian, a grandson of one of the greatest Brussels champions.

Seeing is believing. You have heard of half ton hogs. If you will write to B. M. Boyer & Sons, Farmington, Ia., for a catalogue of their Chester White swine, you will get a picture of their herd boar, Sweepstakes 28006, a 1,200 pound hog. Besides Chester White hogs this firm sell registered Shire fillies and mares. Private catalogue of all stock free on application, mentioning the American Breeder.

Read the new advertisement of the Percheron Importing Company. Chas. R. Kirk, manager, South St. Joseph, Mo. Mr. Kirk began his advertising immediately after the American Royal where he showed the championship group of five Percheron stallions, besides many other prize winners. All these prize winners are for sale.

Something new in the way of a combination colt show and public sale of breeding stock is advertised for December 3 by Otto Westerman of Herkimer, Kas. Mr. Westerman announces in his advertisement in this issue a show of colts sired by his stallions and jacks, and after the show the breeding stock will be sold at auction. In this way every buyer will know just what he is getting. Read the advertisement for terms, etc., and write Mr. Westerman, mentioning the American Breeder.

The high quality of their importations has always been an important feature in the business of J. Crouch & Son, importers of Percherons and Belgians at Lafayette, Ind. For years every important draft horse show at which this firm has exhibited, has listed this firm among the leading winners, and the trade which Crouch & Son have enjoyed is very largely made up of the class which puts actual merit in a sire far above any other consideration. In line with the policy of Crouch & Son to import and sell only the best, this firm has kept on the stand a great deal of the time, famous prize winning stallions which have attracted the patronage of owners of valuable mares. In deference to this trade Crouch & Son now also keep a line of high class mares, as well as stallions. We ask that all parties visiting or writing them make mention of the American Breeder.

Several years ago C. A. Stannard of Emporia, Kas., being a breeder of Hereford cattle and Berkshire hogs, became interested in the use of crude oil as a remedy for mange, lice and other skin troubles in live stock. His experience in this way finally got him into the oil business on a larger scale and he now sells direct to the consumer kerosene, gasoline and all grades of oils for lubrication and dipping. His advertisement is in this issue and we urge every buyer of any oils of this class to read the advertisement and do business with Mr. Stannard where the prices look good. In writing, address Mr. Stannard at Box A, in that way he will know that the inquiry came through the American Breeder advertisement.

B. L. Wilson of Haddam, Kas., wants to exchange breeding stock for land or other breeding stock. See his ad in this issue.

If you have a small farm or farms that you would like to trade for larger tracts of land, it would undoubtedly pay you to get in touch with Shaw & McCuistion, Kansas City, Mo. Read their ad in this issue and then write them.

T. M. Vandevier of Peak, Ark., has a prize winner Coach stallion that he will sell at a bargain. See his ad in this issue and if in the market for a stallion of this kind, get in communication with him.

J. C. Robison of Towanda, Kas., writes that the forty head of imported stallions and mares recently brought from France are in good shape now and ready for sale, and the 50 weanling colts that he imported later from France arrived at Mr. Robinson's farm on November 1 and stood the trip fine. This makes 90 head of imported horses on the farm beside more than 100 head of American bred ones. —Advertisement.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. A MORGAN PRIZE WINNER.

First at Topeka State Fair, 1911. Registered Captain Morgan 5118; traces to Justin Morgan on both sides; seal brown; handsome conformation; extra breeder; colts to show; 15.3 hands; weight 1,200 pounds; foaled 1899. For sale cheap. Quitting horse business. **L. B. Mignot, Wellsville, Franklin County, Kas.**

REGISTERED MORGAN HORSES.

My Morgans are large; 15 to 16 16 hands and 1,050 to 1,300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted. Weanlings to 3 years old for sale by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. **Richard Sellman, Rochelle, McCulloch County, Texas.**

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. **W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.**

NEW HORSE AND MULE FIRM ORGANIZED.

A. C. Scott, John Torpy, W. S. Fletcher and A. H. Langman have organized the Grand Island Horse and Mule Co., at Grand Island, Neb. The new firm will do a general business, as indicated by its name, handling horses and mules on commission.. A regular series of auctions will be held, beginning with a public sale of over 500 head on November 12.

QUESTIONS AND ANSWERS.

(Continued from page 9.)

you would find it beneficial. For this purpose place a gallon of bran in the bottom of a grain sack and on it sprinkle a teaspoonful of the oil of eucalyptus. Hold the upper end of the sack about the nose of the horse and slowly pour hot water from a tea kettle over the bran through a hole cut in the side of the sack. Add a little of the eucalyptus to the bran occasionally. Steam for 20 minutes once or twice a day.

STANDARD BRED HORSES—Where can I get the rules for registering trotting bred horses and where is the record association located?—Texas Subscriber.

REPLY—Write to the American Trotting Registry Association, 355 Dearborn avenue, Chicago, Ill.

BLOODY URINE—My neighbor has a mare he turned to the jack April 27, 1912, and when he returned her in twenty-one days she refused the jack and refused two or three more times, and about the first of August she passed bloody water when she would urinate for three or four days, and about the last of September her water was bloody again. This mare was not sick at either time; was pert and lively and ate heartily all the time; if she ever lost the colt he never knew it. She was in good fix when returned and is still in fine shape. Do you think she aborted or not? What caused her water to be bloody?—Mississippi Subscriber.

REPLY—We suspect the difficulty to be in the bladder and it may be due to the presence of ulcers on the mucous surface of that organ. You should have her examined by a competent veterinarian for the reason that it is quite likely the treatment required for the case would be of a nature you could not personally carry out.

CYST ON EAR—I have a colt about sixteen months old which has a lump on his ear the size of a small walnut and it is discharging something like the white of an egg clear and slimy. The colt is in good shape and doing well. What can I do to remove this lump as it will interfere with the bridle as he gets older? I think the colt had this lump when it was born; I bought him when three months old and he had it then; the lump is not getting larger.—Illinois Subscriber.

REPLY—This growth should be carefully dissected out and any qualified veterinarian should be able to render you satisfactory service in this direction.

EXTENSIVE SWELLINGS—A young four-year-old horse just beginning work; weight 1400 pounds, came in at night from work just a little lame in right foreleg; about one hour after could hardly get him out of stable he was so lame. Next morning right half of breast, a part of shoulder and forearm was swollen hard; breast sore when touched. The swelling gradually increased until it covered half of breast, half of shoulder, forearm to knee, belly to sheath and neck to throatlatch; very hard and very hot; horse in great pain all of the time; swelling drops all at once from where it is swollen to where it is not; when pressed with finger remains dented for some time; when swelling was punctured blood very light colored and clotted quickly and yellow water dropped from it. When foamy blood commenced to run from nose and mouth he was shot; sick five days; swelling on right side of body; no swelling left of center. What was it? What the cause? And the remedy?—Idaho Subscriber.

REPLY—There are a number of diseases that might give rise to a train of symptoms such as you describe. Foremost among these are Septicaemia (blood poison), malignant oedema, purpura hemorrhagica and the bite of venomous insects or snakes. It would require a personal examination to determine the exact cause, but we suspect whatever the nature of the ailment is was sufficiently severe to cause death regardless of treatment.

ALFALFA FOR PASTURE—Does alfalfa pasture injure horses in any way? What do you think of brome grass for pasture.—Idaho Subscriber.

REPLY—Alfalfa is a remarkably rapid growing plant which necessitates its containing a great quantity of water. For that reason it is inclined to stimulate a very free flow of urine, both in its green state and as hay. It is so eminently satisfactory in localities where it thrives that it is a justly popular plant and is growing in favor. Brome grass is well adapted to the more arid sections, where it does quite well on the dry uplands. The ideal pasture is one that contains a variety of several grasses and clovers which not only gives variety to the taste but adds uniformity to the pasture season, as well as prolongs the period for green food.

ALFALFA FOR SHEEP—I would like a little information in regard to the feeding of sheep. I have been told that alfalfa will kill sheep. Is this true? Have any of the readers had experience with alfalfa pasture or bromus inermus for sheep?—Wyoming Subscriber.

REPLY—Alfalfa hay is used in yours and adjoining states as you of course know in feeding thousands of sheep and has perhaps had more to do than any other one crop in the development of sheep feeding in the West. Your inquiry, however, refers to the pasturing of alfalfa. There is always a certain amount of danger pasturing sheep in alfalfa or clover, just as there is in pasturing any ruminant on luxurious crops of this sort. Bromus inermis, or brome grass, is a perfectly safe pasture and probably is desirable for early and late pasturage for the reason that it stands tramping and close grazing in dry weather better than most grasses.

SHIPPING SEMEN—I have several mares in this part of the country weighing from 800 to 900 pounds, and I wish to breed them to secure heavy work horses, but we have no stallion in this part of the country. I have been informed that I could secure suppositories and fluid from some eastern concern. Not knowing where this concern may be, I take the liberty of asking you if you could give me the desired information in full as to the construction of the building, temperature and the general process of this operation. If your paper gives such information I would be very glad to subscribe for same; if not, I would greatly appreciate it if you would tell me where I could secure the above information.—New Mexico Subscriber.

REPLY—A few breeders have been successful in carrying the semen a great distance and producing colts, but we do not recommend this plan as there are many things which might cause defeat. Several stallion owners have complained, however, that they have made a service on a particular mare that was taken elsewhere and several mares bred from the semen which was extracted from the same mare served. One mare in particular was taken nearly 20 miles and used for this purpose, resulting in three live foals. A better method for this inquirer would be to form a partnership with several other breeders who have mares to breed and purchase a suitable sire and keep the stallion at several stands. In that climate the breeding can be done almost every month in the year. Each breeder might have the use of the stallion for one week each; a very great number of mares can be bred in one week with the Capsule System. It is not necessary, however, that this stallion be purchased by a number of men; one breeder might own the horse and have different stands. When this method of breeding is practiced as it should be the value of better sires will be greatly enhanced.

GOVERNMENT STALLIONS—I noticed some time ago in your paper where the government had gotten Congress to appropriate $50,000 for the use of stallions and mares to raise army horses. Can you inform me who and where I could write to see if I could get any in New Mexico?—New Mexico Subscriber.

REPLY—Write to Geo. M. Rommel, Washington, D. C.

REX McDONALD—Will you please send me the name of the cross that made the famous Rex McDonald, as I have a young Donald.—Tennessee Subscriber.

REPLY—The pedigree of Rex McDonald is as follows: Black stallion; 16 hands high; bred by Jos. McDonald, Mexico, Mo.; foaled 1890; sire, Rex McDonald 840, by Criger's Denmark, by Worthington Denmark 64, by Gaines' Denmark 61; by Denmark F. S.. Dam, Lucy Mack 2459, by Black Squirrel 58; 2nd dam, Star, by Old Star Davis; 3rd dam, Mollie, by Sam Martin's Farmer.

ALL PURPOSE PERCHERON—Will you please tell me whether there is a full breed, all purpose Percheron stallion or not? There has been some dispute as to whether there is or not. "A" says he has papers on his horse as being a "full bred, all purpose stallion." "B" says there is none.—Texas Subscriber.

REPLY—There is no record association that specifies an all purpose registered Percheron. There are a lot

LIGHT HORSES AND PONIES.

STALLIONS AND JACKS FOR SALE.

Ennins, French Coach stallion, dark brown, 12 years old, a grand individual. Price $750. Baron, Belgian stallion, blue roan, three years old; his sire and dam both took ribbons at the International. Price $750. June King, a saddle stallion, by Forest King; bay; ten years old; a very stylish fellow and a show horse if handled. Price $1,000. S. Mammoth, 12 years old, black jack with white points, 15½ hands; the smoothest made jack I ever saw. $1,000. H. Mammoth, 4 years old, black with white points, 15 hands; a very heavy boned jack. $1,000. Eclipse, four years old; black jack with white points, 14½ hands; very heavy bodied jack and fine looker. $500. Address, **E. Joy, Golden City, Barton County, Mo.**

HOME BRED PERCHERONS.

One remarkably good coming three-year-old gray stallion, extra heavy bone and will mature at over a ton in ordinary flesh, the way you or I would keep him; one rich black coming four-year-old stallion, wide out, smooth and a flashy mover. Both registered P. S. A., and have state certificate of clean, soundness and health. Priced so any one with a few mares can profitably own one of these young stallions. **Fred Chandler, R. 7, Charlton, Iowa.**

IMPORTED STALLIONS. BELGIANS AND PERCHERONS.

Have just arrived from Belgium and France with new importation of Belgian and Percheron stallions which I would like for you to inspect before buying elsewhere. Barn in town. **C. W. Babcock, Walford, Benton County, Ia.** Walford is 4 miles southwest of Fairfax on C. M. & St. P. R. R.

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

REGISTERED DRAFT STALLIONS AND MARES

for sale; mostly Percherons. Also road stallions, mares and colts at prices to suit your pocketbook and full value; can furnish most anything you want. **E. P. Hamilton & Sons, Garden Grove, Decatur County, Iowa. R. F. D. No. 2.** We are 23 miles southwest of Chariton and 24 miles southeast of Osceola (Station, Leroy).

IMPORTED CLYDESDALE STALLION.

Merrimac No. 11952, for sale; foaled 1902; will be priced right for quick sale. Good reasons for selling. Address, **Joseph Trimmer, Anita, Cass County, Iowa.**

BELGIAN STALLIONS

for sale. Two Belgian stallions coming two and three years old. Both state fair winners. Write for photo and further description to **C. W. McDermott, Wiota, Cass County, Iowa.**

FOR SALE 300

200 Percheron stallions;

100 Percheron mares;

all ages and prices (50 herd headers.)

Singmaster & Sons, Keota, Keokuk County, Ia.

Pioneer Stock Farm

We have on hand at all times Percherons, Belgians, Shires and German Coach stallions and mares; imported and home bred stallions and mares weighing up to a ton or better. They are priced to sell; am selling all the time. Can show if you will only come and see. **John W. Waddill, Brashear, Adair County, Mo.**

HEAVY HORSES

STALLIONS FOR SALE.

One six year old imported bay Shire stallion; weight 2,100 pounds; lots of quality and action; is a sure breeder and gets fine draft colts; 1,000 pounds at year old. This is one of Truman's best.

One dapple gray Percheron; home bred; five years old; weight 2,000; an extra low down wide out draft horse with plenty of quality and action; a sure breeder. Both carry certificates of soundness and pure breeding. Will give satisfactory breeder's guarantee. Reason for offering stallions for sale, am leaving farm for other business and cannot handle them. **G. Y. Dutton, Sigourney, Keokuk County, Iowa.**

STALLIONS FOR SALE.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Am offering these stallions because I have adopted the capsule system and have them to spare. **Henry Dreher, Cedar Rapids, Boone County, Neb.**

IMPORTERS OF PERCHERON HORSES

and dealers in American bred draft horses and standard bred horses and high class jacks. Will sell at right kind of prices and terms to suit purchaser. Give us a look before buying elsewhere. **Fisher & Walker, Evansville, Vanderburg County, Indiana.**

TWO BLACK PERCHERON STUD COLTS

for sale; coming two and three years old; both by imported sire and dam; extra heavy bone and good conformation. Also one seven-eighths blood black Belgian stallion, coming three years old; weight 1,650 pounds and still has the run of a ten acre pasture. **C. Stahly, Milford, Seward County, Neb.**

IMPORTED AND HOME BRED STALLIONS.

I will sell imported stallions, $800 to $1,000, except two stallions. Home bred stallions, $300 to $600. Come and see my horses. **Frank L. Stream, Creston, Iowa.**

American bred, for sale. Also six jack colts and five trotting bred stallions. Right prices on this stock—come and see. Only 22 miles from Kansas City; 8 steam and electric trains each way daily. **F. M. Lorimer, Olathe, Kas.**

of pedigrees in Texas that are not worth the paper they are written on, and this is probably one of them.

THOROUGHBRED HORSES—What is a thoroughbred as designated in our light harness horses?—South Dakota Subscriber.

REPLY—Thoroughbred is the name of a breed of registered horses; they are running horses and the oldest recognized breed of pedigreed live stock in the world.

TOP CROSSES—What is meant by first, second and third crosses?—South Dakota Subscriber.

REPLY—The term "top cross" is used where a mongrel female is the foundation and a pure bred sire is used as the improvement; all consecutive improvements of the same breed of registered sires are called top crosses. The first sire would improve the produce one-half; the female progeny of that union mated with another registered sire of the same breed would result in the progeny being three-fourths of the given breed, and so on. Several live stock associations still admit for registry a certain number of top crosses.

BREEDING TWO-YEAR-OLD MARES—Do you advise the breeding of draft two-year-old mares?—South Dakota Subscriber.

REPLY—If a two-year-old mare is well developed she may be bred so that the foal will be delivered the following year after the grass will do for pasture. She should be broken to work at two years of age but she should be worked very light and just enough to get her familiar with her new occupation so that she will not be handled roughly while pregnant. She should be fed abundantly at all times, for it must be remembered that she must consume enough for two bodies and perhaps a littel later three; if she is not properly fed and cared for it is better not to breed her until she is three years of age, but if she is bred early she will develop into a better brood mare, as a rule, and if properly bred each year should produce a good living foal each year.

COLLECTING SERVICE FEES—A bred a mare to B's horse and traded the mare to C, C to pay for the colt; C traded the mare to E, E to pay for the colt; E traded the mare to F, F to pay for the colt. The mare has a colt old enough to wean but F refuses to pay for the colt. Can C run an attachment on the colt and collect it, the same as any other debt?—Kansas Subscriber.

REPLY—B can sue A for the amount of the service fee and collect it if A is worth it. B should have filed a statement with the register of deeds before the colt was born, then he could have held the colt for the service fee. C has no right of action in this case.

A HEAVY MANE—Can anything be done for an eight-year-old stallion whose mane is pulling his crest over?—Kansas Subscriber.

REPLY—Wet the mane and plait it on the other side, starting at the top with three strands; each time the top plait is put in add a few hairs from the top; plait very tight and tie about every three or four plaits with a wet string in a hard knot. If this does not hold the mane in the right position, tie a weight to it. If this plan is not a success, divide the mane and plait that part which is divided on the opposite side, which will make that half of the mane more easily conquered.

MASTURBATING STALLION—What can I do for a masturbating stallion? Was told to use an ivory band on the penis. Please comment on this method. Where could I get the ivory band? Horse is five years old.—Kansas Subscriber.

REPLY—An ivory ring is very expensive; a celluloid ring is frequently used for this purpose, but breaks easily; it is also difficult to get a ring exactly the right size; a whang leather ring has been used extensively for this purpose with some satisfaction. Measure the head of the penis when it is not erect and sew a piece of whang leather together, making a ring that will fit; the edges should be trimmed off very smooth; the ring should be moved to a different position frequently so as not to create an irritation.

Wolf Bros. Big Boned Imported Percherons and Belgians

We landed September 1st with a great lot of Percheron and Belgian stallions and mares. We showed at the great Nebraska State Fair September 5th and won the following prizes:

Two champions, one reserve champion, eight first prizes, seven seconds, one third and three fourth—twenty-two ribbons in all.

THESE PRIZE WINNERS ARE ALL AT OUR BARNS AND FOR SALE AT VERY REASONABLE PRICES.

If you are figuring on buying a first-class stallion or a pair of imported mares and want to see the best horses, you cannot afford to miss the opportunity to see ours. Special low prices made for the next 60 days. Address, for all information

THIRTY-SIX HIGH CLASS PERCHERONS

I will make bargain prices to early buyers who come here to my farm, on

18 STALLIONS, 18 MARES AND FILLIES.

Stallions range from 3 years down to suckers. Some of the colts are by the great stallion, NICHOLAS.

Some of the mares are imported. Some have colts at foot and all are bred to good big drafty horses.

I will make it worth while to a man who can buy the whole bunch.

George Hirschman, Pierson, Woodbury County, Iowa.

Trumans' Champion Stud

Our second Importation this fall

Left LONDON on MINNEWASKA Oct. 19. J. H. TRUMAN says they are the GRANDEST LOT of SHIRE HORSES that ever crossed the ATLANTIC OCEAN,

Our August Importation

Consisting of the most Sensational Shire, Percheron and Belgian Stallions imported this year, are now in first-class condition, and all for sale. The coming season is our 35th anniversary in the importing business, and during that period the name "TRUMAN" has stood for all that is straightforward and honorable, and we have not found it necessary to change our mode of doing business or our guarantee, which, as usual, is most liberal and good as gold. Imported Shire and Percheron mares of outstanding individuality for sale.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us. At the great Bushnell Horse Show the champion Shire stallion and mare, champion Percheron stallion and mare and champion Belgian stallion were imported by us.

Why Draft Horses Are High and Scarce

A careful estimate as to the average wages paid for a draft team and driver shows that it is a little over $6.50 per day, with a tendency to increase. This is one of the most profitable investments in the country. A good team will pay for itself above all expenses in less than one year. With all the efforts to produce better horses the demand exceeds the supply to such an extent that the average quality of the draft teams on city streets is lower than it was a few years ago. The draft horse markets expect a further advance in the price of draft geldings. The photos shown above were made by the editor on the streets of Kansas City and show fairly the class and work of the drafters employed here.

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

CARNOT 66666 (66666), The PEERLESS PERCHERON SIRE

of the day, represented in a superior

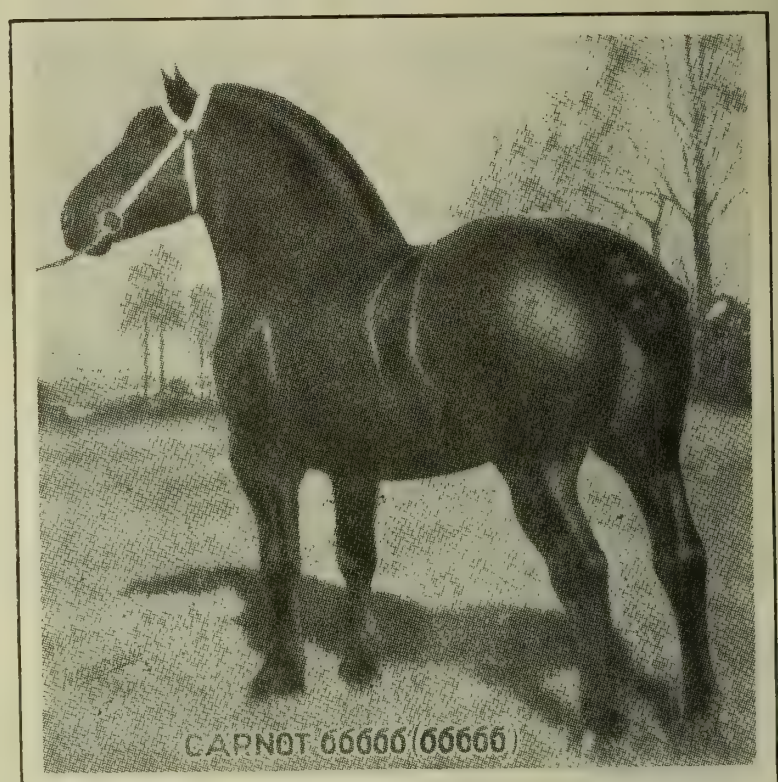
Public Sale Offering

TUESDAY, DECEMBER 10th

Gregory Farm, White Hall, Illinois

5 STALLIONS; 35 MARES

and fillies, practically all either the get of Carnot or in foal to Carnot.



Special Notice:—I have catalogued the "futurity yearlings"—both stallions and mares, that have won for Carnot over the get of the greatest other sires of this country. These colts have made a wonderful development, even over the prize winning form shown at the fall fairs. Their dams, naturally, are mares of outstanding worth.

Every mare in the offering, by the way, is bred to Carnot, except one, and most of them show to be safe.

Remember This—It is already Percheron history that Carnot has not only the greatest show and sale record ever made by a Percheron in one year, but through the winnings of his colts he has been given the same high rank as a sire. In the great futurity show at Des Moines this year, the eight Carnot colts entered won two firsts, two seconds, one third, one sixth, one eighth and one eleventh. Last year the first Carnot colt to be shown won first in six of the leading state and national shows and sold for $1,000. **Is That the Kind of Blood You Want?**

There is a "waiting list" for Carnot colts for stud headers; get a mare bred to raise that kind.

Mention the American Breeder when writing for catalogue to

Imported Percherons

AT PUBLIC SALE DEC. 12

PIPER CITY, ILLINOIS

8 STALLIONS; 33 MARES AND FILLIES.

25 Head of this offering were Imported last May and are Thoroughly Acclimated and in Prime Condition for Service.

This is a great offering for values; 31 head run from well developed two-year-olds up to four-year-olds, and the 33 mares and fillies (over two-thirds of them imported) constitute one of the best collections to be sold this year. The ten yearling and weanling fillies are of the same class and all the mares old enough are bred to an imported stallion.

Sale in town, under cover.

Send at once for catalog, mentioning the American Breeder.

J. H. DECKER,

PIPER CITY, ILLINOIS

Auctioneers, FRED REPPERT and N PLANK.

N. B.—Parties attending Mr. Corsa's sale at White Hall and Mr. Cottingham's sale at Eden can make good connections at Peoria for Piper City, and can easily reach Gibson City for Mr. Roth's sale the day following mine. All are invited.—J. H. Decker.

BELGIAN AND PERCHERON STALLIONS AND BELGIAN MARES.

Imported and Home Bred—11 American Royal Prize Winners, 1912.

All of our horses are selected with extreme care as to breeding qualities. They are sound and fully acclimated. Sold with breeding guarantee and terms to suit, at farmer's prices.

Come and See Us, or Write,

BLUE VALLEY STOCK FARM, BLUE MOUND, LINN COUNTY, KANSAS.

PERCHERONS AND BELGIANS

AT AUCTION

DECEMBER 13TH

1 P. M. SHARP

GIBSON CITY, ILLINOIS

45 IMPORTED STALLIONS AND MARES 45

The Ten Stallions run from weanlings to six years old. The 35 Mares and Fillies are a great lot for ruggedness, bone and constitution—just the kind being demanded everywhere.

The breeding, as the catalog will show, is all that can be desired. The Belgians carry the blood that is giving that breed prestige. The Percheron fillies trace close to that famous sire of producing blood, Besique.

The offering has been selected from three importations, the latest of which will have been in this country four months on date of sale, so that everything will be in good condition for the buyer.

Be sure to write at once for my catalog, and mention the American Breeder.

Remember the sale of Ira Cottingham, Eden, Ill., on the 11th, and of J. H. Decker, Piper City, Ill., on the 12th; good train connections for all.

D. K. ROTH, Gibson City, Illinois

VOLUME 5. KANSAS CITY, MO., NOVEMBER 20, 1912. NUMBER 21.

STALLION INSPECTION LAWS

About one-third of the states have stallion inspection laws. Most of these laws are unconstitutional. We had hoped that a certain change might take place so that a better understanding and more satisfactory methods would be brought about. But the breach seems to be widening each year between the breeders and the laws. Little, if any attention seems to have been paid to the owners of stallions and jacks, and these are the ones that should have been consulted first.

Most of the laws disqualify stallions from public service when they are found to have certain unsoundnesses; others prohibit their sale. After a careful study of the situation we do not believe that a stallion should be disqualified unless it has an infectious disease, but we believe that stallions should be examined physically, and as to breeding, and be advertised for just what they are. This kind of a law would be fair to all and would be educational. We do not believe that there would be any serious objection to a law of this kind, and furthermore it could be made constitutional.

That part of the Kansas law requiring the specifying of unsoundnesses and rating as to breeding, has been very satisfactory, except that instead of saying unsound it might be better to name the ailment in all advertising, so as to give the public the exact condition. An excellent individual might have a slight side bone that would not be transmitted readily, yet this animal would be disqualified by some laws; while in the same vicinity an undersized, inferior stallion might be allowed to stand that would sire a lot of colts which would not pay for their production. Yet the disqualified stallion might produce a lot of good horses. We could not at once eliminate all unsoundnesses even if we retired all stallions and mares from the breeding ranks which are unsound or have any weaknesses which might be transmitted, but it would seriously cripple the business.

The possibility of having stallions disqualified on account of some not very apparent weakness has kept a great many from buying stallions or jacks, as they are afraid to chance their judgment. A few communities are fairly well supplied with good pure bred stallions, but nine-tenths of the localities are in sore need of better sires, and until this need is in some measure supplied we do not believe it advisable to handicap the buying public with any law that will disqualify otherwise good stallions or jacks entirely. If a law is to be enacted that will disqualify a stallion, the examination should be made in such a way that his certificate of soundness would protect him permanently. Then the breeder, dealer or importer could have the examination made and remove all doubt as to further examination. Is the present method of examination satisfactory? Should a severe injury, received after purchase, disqualify a stallion or should it be restricted entirely to the weaknesses plainly inherited and transmittible?

Changes That Must Be Made Before They Will Be Fair to All and Productive of the Greatest Good. Improvement Through Education.

We should like to see representatives from all of the state stallion registration boards meet in Chicago during the International Live Stock Show and formulate a uniform law, so that the examination in one state would stand good for all. The examination should be made by the state and the expenses of the examination should be paid by the state, as it is an advantage to every one interested in horses. The plan of requiring an examination each year at an expense of from $5.00 to $25 to the stallion owners should be eliminated. If the expense was met by the state, all interested parties could be notified to meet at a certain county seat on a certain date where a large number of animals could be inspected during that visit, which would not make the expense unduly heavy on the state; it would also prevent any suspicion as to any leniency or friendship on the part of the examiner.

The feature of the laws referring to "record associations recognized by the Department of Agriculture" needs some attention, as the government has not recognized any American associations since January 1, 1911. When a new law is drawn it should not copy some old list of live stock associations to be "recognized" but a national committee of stallion registration boards should examine every record that applies for recognition and let each stand on its merits. In this way it would be possible to recognize new associations when the breeders made such a demand. Provision should always be made for meritorious new record associations. It is likely that others will be formed. For instance, if the American carriage horse breeding experiment proves satisfactory, a record for this breed will require space and other breeds of live stock might spring into prominence. It must be remembered that the plan of registering live stock has all been developed within the last century, and the new needs must be provided for.

Certain state laws require the sire and dam of an animal to be pure bred and registered before the animal will be recognized. Every state having such a law has itself violated that clause. There are not over 300 jacks in the United States that could meet this requirement, but many others have been enrolled. It might be profitable to have jacks examined for unsoundness, but is it advisable to require blood lines till more of them are registered. If jacks are included, from a registry standpoint, the Standard Jack and Jennet Registry of America should receive the principal recognition. We should like to see finally only one record association for each breed, but that association should be founded on substantial principles.

In the making of nearly all the stallion inspection laws the stallion owners, numbering 60,000 men in the states concerned, and representing over $100,000,000 of investment, have been the least consulted; the pure bred stallions, that were absolutely sound, have had the advantage in advertising those facts to the public; outside of that the Utah law has given a lien on the mare and foal for 18 months after the mare is bred without further requirements. This clause could have been enacted in every one of the stallion inspection laws without any difficulty. This would have given the stallion and jack owners something for their money. As the matter now stands, most of the stallion and jack owners feel that the laws are a detriment to them; many of them are not complying with the laws; neither do they intend to. One state's law has been tried and found unconstitutional. Arrangements are being made in other states for this same purpose. It will only be a question of time until more horse breeders will ignore these laws entirely. What is the use to enact a law that will not stand and invites law breaking. If a majority of the horse breeders are opposed to these laws under the present wording, they can control the situation.

The American Breeder was one of the first national newspapers to recommend the stallion law; we believe it is to the best interest to every one interested in horse breeding to make certain changes in these laws that should be satisfactory, as a rule, to horse breeders. What the horse breeders want and are going to have is a lien on the mare and colt for 18 months after the mare has been bred—the same as the Utah clause. They are also demanding that no stallion be disqualified. We do not believe that many of them would object to advertise their stock just as they are. Why not get together and pass a law that will mean an improvement in live stock, where everybody will be satisfied, instead of continuing the warfare. In one state a horse breeders' association has been formed for the purpose of fighting the stallion inspection law. At the next legislature this association will ask the state for $7,500 for the improvement of horse stock in that state, and this money is to be used to combat the stallion inspection law. In all probability this fight could be averted if the law was differently worded and in the end get much better results. We are sure that $7,500 could be invested in a much better way than to have one division of the state fighting the other. This is only one of many similar conditions; if this law would give some of the things which horse breeders want it would be more satisfactory for those in charge of the stallion registration board and it would be an advantage to all parties concerned. These laws were introduced several years ago and those interested have had an opportunity to study the general condition and come to a satisfactory conclusion.

The principal improvement in live stock is brought about largely through better sires. The stallion situation is peculiar to itself. First, if improvement is to be made, it is necessary that some public spirited citizen make the purchase of an outstanding individual. If the man who ordinarily would do this is afraid that his judgment is not sufficient to safely purchase a stallion to stand in a state where certain conditions are liable to disqualify the animal from service, he is not liable to spend much money. The clause in the stallion laws which has disqualified many sires has caused a chill to run through the prospective stallion buyers. In most cases stallions are purchased with the expectation of standing them for public service and depending on the collection of service fees. It is not necessary that any man buy a stallion unless he has a number of mares to breed, but it is the demand in his community which stimulates this market.

Anything done to interfere with the purchasing of better sires retards their distribution; that is, they remain bunched up where they cannot accommodate the most mares to the best advantage. One breeder may own a dozen or more young stallions that should be distributed throughout the country. The American Breeder wishes to encourage the propagation of sound horses as far as possible, but we do not believe that it is advisable to antagonize the buying public with that fear of disqualification. In the end the best that can be done is to make these laws educational as far as possible, for all improvement in live stock must come through a better understanding. If, as would often be the case, the mare owner prefers to breed to the stallion having the weight or conformation or breeding, or vigor which he desires, even though the horse be unsound in some minor particular, he should have that privilege. The average mare owner has not given these defects much serious study, but if the advertisement describes the ailment of a stallion it would have a tendency to cause him to investigate the seriousness of such an ailment and rightly decide for himself which to do. Simply barring the horse could hardly bring results as good as this.

In order to improve the horse stock in this country the essential thing is to make the stallion business profitable. Then there will be an abundance of capital ready to invest in the best sires obtainable. The improvement in horse flesh cannot be brought about by hampering those who have invested their money or who intend to purchase outstanding individuals.

The most important thing in horse breeding today, from the stallion owners' standpoint, is the collection of service fees. If the Utah clause was in effect in every state a great change would immediately take place. About one-fourth of the living colts are never paid for. This would make a handsome profit in the stallion business; in fact, it would make the business a pleasure because the collection could be made through the bank. In many localities it is more difficult to collect the money than it is to breed the mares. If a lien was

given on the mare and the offspring for 18 months after the mare was bred, the mares would not be changed from one sire to another throughout the season. As it is now a mare which is a little hard to settle is frequently bred several times during one heat period to different sires over the country. Not only does this waste the energy of the stallions, but many of these mares are diseased and spread a serious infection. The Utah lien law would be an advantage in this regard, to all honest mare owners, for it is they who are required to pay the expenses of maintaining the sires. About one-fourth of the colts which are not paid for are assessed to the other three-fourths who are willing to meet their honorable obligations. No intelligent man can say that the Utah clause is a disadvantage to the stallion or jack owners and the honest mare owners. The intention of this clause is to force the dishonest man to pay his own debts. This clause would give the mare owners until the colt was six or seven months of age to pay the service fee. The stallion owners would not force the collection any sooner, which would give everyone an opportunity to pay the debt if he cared to. The "stand and suck problem" is so well established in America that it will never be changed. If the "stand and suck" problem was abandoned by the owners of good sires in a community it would only drive a large majority of the good mares to the inferior sires.

We wish to say in conclusion that we believe all those who are in favor of live stock improvement, after a careful consideration, will use their best efforts in every state to obtain a lien on the mare and colt for 18 months after the mare has been bred without any further requirements, and that any stallion inspection law which does not include this clause will not be met with favorably.

STALLION OWNERS TO ORGANIZE.

To the American Breeder:—Recently I have been talking to some of the owners of pure bred stallions in this county with the idea of co-operating in an effort to establish as far as possible uniform terms, and a general method of dealing with that class (happily in the minority) of men who never have the money to pay for a colt when it is due, and who compose the patronage that gives us most trouble.

It also seems that if we would meet once or twice each year and discuss the problems that perplex us in the operation of the business, much helpful information could be distributed, and we would be enabled to give better service and be in position to demand pay for what we do.

The co-operative plan outlined in an issue of the American Breeder cannot be made to work here, but I would appreciate any suggestion that the readers of this paper might make. Doubtless there are in operation in some parts of the country organizations of this nature that are a success. A few words from some of the members of these associations will go a long way toward solving the problems of this community.

At the meeting I intend to suggest that we attend the Graham Scientific Breeding School in a body.—William Beel, Montgomery County, Kas.

THE AMERICAN BREEDER A SPLENDID PAPER.

To the American Breeder:—At this late day I want to express my appreciation of your American Royal report, especially that part referring to the good fellowship of the management. I quite agree with you in your opinion. By the way, you are making the American Breeder a splendid paper. —W. L. Nelson, Assistant Secretary Missouri Board of Agriculture.

All Live Stock Supplies Short

Horse Supplies Lightest In Three Years, For the Season. Cattle Up Again, On Shortened Receipts. Packers Fighting the Eight-Cent Hog.

Horses still have the better of the trade, compared with mules. The South has entered the markets with renewed vigor, and is buying the light and medium weight horses that sell at $80@150 a head. Prices for that kind are firm. The cotton harvest with its big movement is well under way, in fact, the big end of it is over, but the finish season, field work, hauling and the big part as far as horse power is concerned is only just started. The South now has had two good cotton crops, this year's not as large as last year, but still above the average, and their purchasing power is large. They will probably continue buying well into the winter and begin again early next spring. Heavy draft horses are in good request, but the trade in that line is small in volume because so few are offered. All markets in the past ten days have reported a light supply of heavy drafters and country buyers say it is nearly impossible to get them within a reasonable price limit. Several traders have been looking for good weight mares in foal, a rather risky proposition for open market trade, but they say they have places to put them where buyers are willing to take the chances now in order to get some brood mares for another season. A good many worn out city horses are being turned back to market, most of them defective in some particular, or else over worked. They are selling in a class by themselves and to traders who can rest them. The pluggy kinds, of course, go on a scalper's deal. Total receipts of horses are still running short of the same season in the preceding three years, and this shortage in itself is sufficient to maintain prices. Farmers are independent as far as feed is concerned, and there is no reason to increase shipments.

Slack Demand for Mules.

In the past two weeks demand for mules has not been urgent and after a season of unusual activity traders are inclined to emphasize the dullness too much. For more than a year they have been able to sell consignments right off the reel as it were. When there is some hesitancy in demand they are inclined to quote trade extremely dull. Reports from no market, however, indicate that any large supplies have accumulated, on the contrary, receipts have been moderate and barns have been kept fairly well cleared. Prices are about $5@10 a head lower than two weeks ago, but considering the high prices that have prevailed, this decline is of small consequence. The let-up in demand is attributed to the nearness of the holiday season, but the surplus supply of mules is in strong hands and can be held for opportune marketing.

The following quotations are for serviceable, sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$250@300
Drafters, fair to good	150@225
Chunks, fair to choice	135@165
Chunks, fair to good	90@130
Expressers and light draft	65@135
Plain workers	50@ 95
Southerners, good	130@150
Southerners, plain to fair	60@120
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 85@130
14 to 15½ hands	115@160
15½ to 16 hands	155@200
16 to 16½ hands	185@275

Rally in Cattle Prices.

Cattle prices in the past two weeks improved 35@50 cents, though they are still under the highest point of the year, about the first week in October. On Monday of this week they rose to within five cents of the top, a car load of grade 1,407-pound Shorthorns from Nebraska, bringing $10.85.

Week before last the national election reduced shipping operations materially and last week, though receipts increased they were short of a year ago. The feature in the market has been the change in the character of the offerings. The past two weeks have about finished up the final shipments of grass fat cattle, and short fed grades are beginning to move. The movement from the Mississippi river eastward has been larger than to the westward, and for that reason Chicago supply has been liberal while river markets have had comparatively few. Demand has opened the season for fed cattle with considerable vigor and the next six weeks is the season of the year when demand for beef is unusually large. Packers have no surplus beef left over from the grass season, something that has not occur-

(Continued on page 13.)

HORSE BREEDING.

Unless the next term of the Scientific Breeding School is well patronized, it will be the last term for one year. Twenty terms of School have now been held. Students from nearly every section of the United States have attended; the breeders have had an opportunity to find out for themselves whether the instruction was valuable or not. If the breeders of America want an institution to continue in business where they can get expert information on this particular subject, they must patronize it or it will be partially discontinued. No matter what happens there will be one term each year for those who have a life membership. In order to be of the most benefit it is necessary for an institution of this kind to have enough work along this special line to keep the best posted instructors, and this kind of instruction is not given anywhere else.

Those who have officiated at this School have, through study and investigation, constantly increased their efficiency as instructors. Many new things have been developed; equipment and facilities for teaching have been added from time to time, but with all scientific knowledge and apparatus one thing has been foremost, and that is to make all lectures and demonstrations plain enough for the average breeder to thoroughly understand. No matter how much an individual may know, if he cannot deliver it to the horse breeders in a plain manner, they will not receive much benefit. Individuals who could not read or write have attended this School and got good results. Hundreds of students have doubled their income without increasing their investment, yet this School has not been properly attended. We cannot understand why any breeder is not interested in an institution of this kind. Hundreds of students have written the management, stating that they intend to attend some time, but continue to put it off.

The next term of School will be held December 16 to 21, inclusive—six days and nights of instruction for horse breeders. A few extra service fees will pay all the expenses, and this should be secured to the breeders in one week's time at the next breeding season. The information can be used for life, and improved on each year.

This School offers an opportunity for breeders to learn to be experts in their business. Those who pass the examination will receive a diploma that can be framed and hung on the walls of an office, which is an excellent advertisement. A graduate horse breeder is just as essential in this line as a graduate of any other profession. Some may say that a school lasting only six days and nights has not sufficient time to impart a thorough education, but the instruction given at this School does not enter into the technicalities. Just the essential things in horse breeding are taught. To cover the same course in a technical manner would require several months. As it is now, any ordinary horse breeder can receive full benefit.

How much better it would be for the horse breeders in general if all of them could examine their mares easily and know in a minute whether the mares were ready to be bred or not. Many useless services are made. Out of each three mares bred in the United States only one colt is produced, on an average. With this education at least two mares can be made producers out of every three bred. This alone will double the income.

There is no professional class of men that know as little about their business as the owners of stallions and jacks. We are ashamed to admit this fact. We had hoped that the Scientific Breeding School would grow to be a prominent institution, not only in size, but that it would continue to increase in knowledge. The co-operation of the honest, progressive breeders can still bring this about, but several factors have been at work to injure this school. The owners of scrub stock and those in sympathy with the degeneration of better stock are the principal enemies. A few men interested in crooked pedigrees have also been opposed to the better methods. Advertisement.

TRAINING THAT DOUBLES ONE'S INCOME.

To the American Breeder:—Without a doubt it would be profitable for the Wisconsin subscriber to attend the school. To show that it has been profitable to me, I have this season (not saying what it did for me last year) 85 mares booked and bred to my three-year-old Percheron stallion, Jones (84758) 80588. Without my attending the school I would not have bred over 40, and to show that I have been successful with the scientific method, five of these mares, worth from $250 to $400 a piece, have been bred every three weeks for three years during the breeding season, and not one has raised a colt or even been in foal. They were bred by the old method by men that have been in the breeding business for 40 years. This spring these five men came to me and asked if I could get these mares in foal with that "machine" (machine breeding is what my opponents call it here). I told them if they would let me examine these mares and breed them as I wanted to, I would try them. "All right, I will give you $5 on top of your price if you get mine with foal." I bred these mares once a piece by the method I learned at the school and they are all safe in foal. You know what this will do for me next year? I do. Profitable? Yes!—H. Mamhardt, Washington County, Iowa.

BELGIAN MEETING IN CHICAGO.

To the American Breeder:—The American Association of Importers and Breeders of Belgian Draft Horses, will hold its twenty-fifth annual meeting at the Assembly Hall, Union Stock Yards, Chicago, Wednesday, December 4, 1912, at 7:30 p. m.

All interested parties are cordially invited to be present.

Societe "Le Chevel de Trait Belge" of Brussels, Belgium, has donated thirty-two gold medals and four silver works of art which are to be given under the auspices of this association at the International. This association also gives four gold medals and cash prizes. All of these special prizes added to the cash prizes offered by the International, will make it a great year for our exhibitors and should be taken advantage of, as no one will probably go home without carrying off his share of these gold medals and cash prizes.

Two Great Sales

100 PERCHERONS

SCIPION 27123 [43667]

Lee Brothers' Sale
December 17th

J. C. Robison's Sale
December 19th

An Opportunity Unequaled among Western Draft Horse Auctions

At the Kansas State Agricultural College Judging Pavilion,

Manhattan, Dec. 17th

we will sell at auction:

15 Percheron Stallions
35 Mares and Colts

including our Successful Show Herd, season of 1912, in which were GALETTE, Grand Champion Mare of Four Big Western Shows; CARNO, Champion American Bred Stallion, and others.

20 Great Mares Bred to Scipion 27123 (43667), a Champion in both France and America.

No horse man can do better than spend a day at this Sale and see one of the world's greatest colleges.

For catalog or other information address (mentioning American Breeder)

BUY BREEDING STOCK EARLY.

Quite frequently purchasers of breeding stock try to economize by buying their stock late, believing they will save something in feed, interest on the money and the care; they do not seem to realize that the owners of breeding stock can sell it much cheaper now than they can next spring. They would have the same expense that the purchaser would have, and many breeders and dealers are anxious to turn their money several times during one season which encourages them to sell as close as possible.

This, however, is only a small feature, as all breeding stock is purchased with the intention of making the most out of it. Stock will do better after they have become accustomed to their new surroundings, feed, management, etc. In fact, most of the failures in breeding stock, and especially stallions and jacks, comes from the late purchased animals. They have not had much exercise and are excessively fat. New stock for public service should be purchased early so that prospective patrons could have an opportunity to cast their optics on it. Many public sales and other gatherings afford an opportunity for advertising, as well as literature calling attention to the new purchase and giving the location of the place at which it can be seen any time. Many of the best mares (which are the profits in the breeding business in most localities) are booked in the fall and early winter.

With jacks the early purchasers should have little difficulty on account of slow servers, as they, especially, do better after being accustomed to their new master and new surroundings.

There is one special condition in the breeding business that needs immediate attention and that is, the disposing of breeding stock that needs to be turned. The average breeder uses the telephone and his county paper as medium for disposing of his surplus, believing that some one will accidentally hear about his particular stock and that he can sell it without any expense; he does not realize that the feed and care continuously cost money, consequently his stock is frequently kept over for another year without any returns but at a cost of $100 to $500. The animal is then a year older, which detracts from his selling value. A reasonable amount of money invested in live stock paper advertising will find a buyer if a publication appeals to that particular class of readers. It is not usually a success to advertise stallions or jacks in a Builder's Trade journal; breeding stock should be offered to those who are interested in that special class. For instance, if stallions and jacks were offered for sale, and a publication could be found that was read almost exclusively by a class interested in such stock, there would not be any waste circulation—nearly every subscriber would be a possible buyer. If any other class was offered, horse breeders are mighty good prospects. Horses, jacks and mules have made more clear money during the last ten years than any other kind of stock and their owners have the cash, making them the best class of buyers in the market today.

We would like to see all breeding stock change hands early, and not wait until late in the spring. Those who have stock to dispose of should be as much interested as the buyers, for it would be an advantage to both. Before the stock can be sold through an advertisement, advertisers must do their part.

ONE THING AT A TIME.

One important thing for editors of newspapers to consider is whether a publication is to entertain or instruct. Our plan is to accomplish something that will give our readers a lasting benefit. These campaigns cost money and usually make a lot of permanent enemies. But the results obtained are worth the efforts.

Since this paper was founded we have had several successful campaigns. We are proud to note that the American Breeder has always been on the right and the winning side. Among the most important campaigns has been the only successful campaign for clean pedigrees in American history, the campaign for the Capsule System, and many campaigns of investigation, including the discovery of the barren mare germ. Our efforts are now directed to a campaign that means a great deal to the average horse breeder—a campaign to give breeders a lien on the mare and colt for 18 months. This campaign can only be won by the concentrated efforts of all those interested in horse breeding.

We hope our readers will appreciate the efforts of a publication that works for their best interest, regardless of the consequence. In building a permanent proposition of any kind, those in charge must have in mind that honesty of purpose is the most profitable in the long run and that the field of endeavor must not be too large, as the best results are often obtained when the energy is directed to one thing at a time.

JACKS.

It does seem strange that $10 is the limit in many localities for the service fee of a good jack. We are wondering if the American farmers stop to realize the true value of a good jack in their community where jacks are used extensively. The jack situation is different from the stallion situation as the average farmer does not raise jacks while the average farmer does raise grade stallions. Mare owners pay more attention to the kind of jack they use. One reason for this is that the produce is judged by its selling value at weaning time. Mule colts are usually sold as soon as old enough, and if a colt does not bring a good price a new sire is often sought. Mule colts sell for about one-fourth more money at weaning time than the average horse colt. This alone is creating a wonderful demand for jacks and causing many breeders to add a good jack to his breeding stock.

The service fee for a good jack should not be less than $15 and an extra good one $20, or as high as the best stallion. It is very easy to raise the service fee and it is profitable if the sire is good enough. If a jack stands for $8.00 or $10.00 he gets a lot of cheap, inferior mares, many of which are not producers, especially the old mares. If a colt would cost $15 or $20 some of the worn out mares would be eliminated. This would increase the per cent of foals.

This move is especially necessary where a jack is used extensively, as no jack should average more than two mares one day and one the next—natural service. There are a lot of stallion owners that could add a good jack to their collection very profitably. Jacks usually require a teaser; most stallions can tease for a jack very easily without any serious detriment. A good jack will make as much money in a community where a jack is needed as any other animal at the same cost. They require very little attention in the hands of those who know their needs. A good jack should pay for itself above all expenses in a very few years and it is not necessary to dispose of them on account of their fillies as in the case of a stallion.

The mule industry in this country is growing rapidly; only a few individuals have realized the great extent of this growth and it is only in its infancy. One-fourth of the mares in the United States have been bred to jacks this year. We now have over 4,000,000 mules—more mules than can be found in the rest of the world. We want our readers who are located in a mule breeding district to study the jack industry closely, as it means money to them.

STALLION SERVICE RECORD BOOKS.

We are now making up a new service record book for stallion and jack owners and want our readers to send in their suggestions. The present book does not afford an opportunity for giving a complete description of the mare; it should have room to give her breeding condition in detail, so that a tabulated record could be kept, of all mares bred, and give the breeders an opportunity to study the breeding condition of their mares.

At the present time about all the average breeder knows is that if a mare does not produce a colt he will not get any money. But we want our readers to study this condition and find out why certain mares do not produce. This is a big field and it requires much thought.

The barren mare situation is getting worse each year. We will have some new information on this subject and we want as much information from our readers as we can get. Every breeder is an experimenter to some extent. Any information that may help us to improve this stallion service record book should be offered. It is the intention to have room in the book for 100 mares. Some of them will be made double which will accommodate 200 mares. A tabulated index will be given so that all the mares owned by one man can be quickly found.

VETERINARIES AS BREEDERS.

To the American Breeder:—I am a graduate veterinarian; just graduated last spring and located in practice here. However, have competition in that there are two non-graduates and one graduate here before me, and consequently it is hard to get a good start, but I located here because my folks are here and I know the people and conditions, etc., and feel that I can get a good practice if I stay at it and go about it in the right manner.

I had figured on establishing a veterinary hospital and breeding establishment, building a structure containing a well equipped office and operating room, about three box stalls, about four or five double and single stalls and a place for automobile and buggy. Also planned to buy a draft stallion—Percheron or Belgian, or whatever is decided on; also one of light breed such as German or French Coach or Hackney, and establish modern breeding practices as advocated by you. The office, etc., would be equipped with a microscope (high power), sterilizers, other laboratory equipment, etc., that would be necessary to conduct a veterinary and breeding practice in the most scientific, practical and approved manner. I would arrange to attend the Graham Scientific Breeding School sometime during the winter to thoroughly post up on breeding subjects.

With judicious advertising don't you think it would be a money making proposition if conducted on business principles? The stallions could be bought from a responsible firm on long time notes that the horses could pay for themselves before the payments were due.

I would be very glad to hear from you with your opinion of the proposition and any advice or suggestions will be most thankfully received.

I have read your paper since the first copy was issued and consider that your opinion in this matter will be of great value to me.—South Dakota Subscriber.

In building a permanent practice a location should be chosen where the competition is not too severe. One graduate veterinarian in each locality is usually sufficient, more especially since there is such a great need for the services of qualified men in other localities. If the other graduate veterinarian has been successful, and is of a good character, and energetic, we believe that another locality might be found which would prove more satisfactory to you in years to come. Unless your locality is different from that of the average, a young man can frequently do better among strangers than in a locality where he was raised, especially in a case of your kind, as many people do not realize that a vast change can take place during a period of three years in a young man's life.

If you decide to stay in this locality and open a hospital and breeding barn, we would advise you to purchase an outstanding draft stallion to begin with for your locality; you could interest a number of mare owners in your vicinity in the stallion, each one putting up a hundred to two hundred dollars in cash, then you could charge them a reasonable amount for keeping the stallion, or take him on shares, which would be better for you. This will not only help pay your running expenses, but should form a close bond of mutual interest between you and the farmers. This would not interfere with your practice except that it would be necessary to have a breeding hour. This would require you to be at the barn one hour each day. Five hundred mares can be bred to a draft stallion if the mares are available.

We would suggest that in building your hospital that you build a shed on the east so that the sun would shine in this enclosure in the forenoon, and the breeding hour can be at four o'clock in the afternoon while the sun was in the west. The sun would have a good effect on a place of this kind but would not interfere with the breeding operations in the afternoons. Do not have your breeding room and your hospital in the same building as there is usually more or less blood, which is very likely to interfere with your breeding practices. Usually, also, more or less antiseptics are used, leaving a bad odor which would cause more or less uneasiness on the part of strange mares—a bad

Important Announcement

For December Term (Dec. 16 to 21) of the

GRAHAM SCIENTIFIC BREEDING SCHOOL

The Term Announced Above for December is the Regular "Before the Holidays" Session of School. An Article Elsewhere Deals With Important New Information Concerning This Term.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. The instructors, of whom there are ten, include horse experts from the leading agricultural and veterinary colleges, who know the needs of stallioners.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL

225 West Twelfth St., Kansas City, Mo.

ondition. There might also be some isadvantages by having infectious atients about the hospital, but the ffice of the hospital might open out nto the breeding shed without any erious difficulty.

Graduated veterinarians are equipped with much valuable information long these lines but much of the modern breeding methods are not taught t any veterinary college, their efforts have been directed more especially to the diagnosis and treatment of animals. The three years required or a regular course are crowded full f high class, scientific education that s most valuable to the live stock industry. There is probably no class of men that wields as much industrial nfluence in their respective communities as the graduated veterinarians. But some of the text books which ave been used on breeding subjects hould be changed.

Ordinarily we do not advocate an ndividual to be a professional breeder nd a veterinarian at the same time. 'hese are both extensive subjects, and specialty along one line or the other s usually more profitable in the end. But these two professions can be of nuch service to each other. We are orry to say that in too many cases hey are antagonistic. We do not believe that any individual has reached he point at which more knowledge f a valuable nature cannot be obained.

IMPORTED JACKS.

One of our readers called our attention to a number of jacks which re purported to have been imported ecently, and to one in particular. The ack in question was probably born on merican soil. If the gentleman is incere in his proposition, and would end us a good description of the anial and the registry certificates, we ill be glad to investigate it fully.

It must be remembered that the writer was in France and Spain last year and has a very good idea of the extent of the jack importing business. This animal can be traced very nicely if it is necessary. We do not object to imported jacks. This country needs all the good jacks it can get, from anywhere. Good jacks are more and more needed each year. But we do not wish to see an individual protected by a registry association in misleading our readers. A registry association that will help a fraudulent transaction is just as much to blame as the individual who makes the misstatement.

The best jacks in France or Spain are too high to bring to this country to sell for ordinary breeding purposes. A few of the better individuals might in a few rare cases, be brought over to head herds, but we believe with a little effort the American breeders can produce just as good jacks, and in many cases better, than can be found in the balance of the world.

HORSES FED ENSILAGE SUCCESSFULLY.

To the American Breeder:—In your issue of October 21, "Illinois Subscriber" wishes to know about feeding silage to horses. In answer will say we have fed it quite largely to horses of all ages for three winters past with entire satisfaction. We would caution subscriber to beg.. feeding carefully at first until the stock is well accustomed to eating it, and be doubly careful not to feed moldy or in any way damaged food. —C. T. Ayres & Son, Clarke County, Iowa.

One Advertisement; 100 Answers.

To the American Breeder:—Please find enclosed draft for the ad in the American Breeder. I received at least 100 letters in reply to it. Guess it will enable me to find what I want.—G. L. Epperson, Llano County, Texas.

Trumans' Annual Sale

of Imported Shire and Percheron Mares

Pioneer Stud Farm, Bushnell, Ill., Dec. 12 and 13

One of the grandest offerings of draft mares ever made on this continent. We include many prize winners and animals never shown, but excelling in breeding and individuality. Also the cream of the females from our last importation, which J. H. Truman says is the grandest lot of 46 Shire that ever crossed the Atlantic.

Send now for catalog of this sale, mentioning the American Breeder. Address,

Trumans' Pioneer Stud Farm Bushnell Illinois

A Colt Show and Sale of Breeding Stock

ON TUESDAY, DECEMBER 3rd, at my farm adjoining Herkimer, Kans., two stallions and two jacks; also a few grade Belgian colts; all good ones.

One Belgian stallion, Virir De Volle No. 1699 (25554), sired by Mariemont (14992); he by Gerfaut 11 (2538), out of Esperence (8265); dam Diane (5033). One grade Cleveland bay of good conformation and a fine looker.

Black mammoth jack, Victor No. 779, sired by Young Missouri 655; he by Alexander, Jr.; he by old Alexander of Kentucky; dam Mintie by Young Compromise; 2nd dam by a son of imported Black Knight. This jack is thin and yet weighs 1,045 pounds; works on mares and jennets alike. Have got five colts from jennets and four were jacks.

Also one half-Spanish jack; a little undersize but a good breeder. Have no colts from him as I just got him last winter.

There will be colts at this show and sale that will cause any man to take off his hat. Sale will begin at 1:30 p. m. sharp. Terms, cash or bankable note; seven per cent on six months' time.

OTTO WESTERMAN. **HERKIMER, KANSAS.**

COL. F. E. KENNEY, Auctioneer.

Herkimer is on the St. Joseph and Grand Island Railroad.

Always mention the American Breeder.

STALLIONS FOR SALE.

One six year old imported bay Shire stallion; weight 2,100 pounds; lots of quality and action; is a sure breeder and gets fine draft colts; 1,000 pounds at year old. This is one of Truman's best.

One dapple gray Percheron; home bred; five years old; weight 2,000; an extra low down wide out draft horse with plenty of quality and action; a sure breeder. Both carry certificates of soundness and pure breeding. Will give satisfactory breeder's guarantee. Reason for offering stallions for sale, am leaving farm for other business and cannot handle them. **G. Y. Dutton, Sigourney, Keokuk County, Iowa.**

WANT TO QUIT BUSINESS.

Two Percheron stallions for sale; one dark chestnut 8 years old, weight 1800 pounds; on dark gray, 3 years old, weight 1700 pounds. Also my big black jack with white points, 7 years old, weight 1100 pounds, 15½ hands standard measure.

All sure breeders; colts to show. Would exchange for draft horses, mules or cattle.—**G. W. Newman, Elvaston, Hancock County, Ill.**

TWO BIG BLACK IMPORTED PERCHERON STALLIONS.

Ages 5 and 7 years; weight in ordinary condition 2,000 and 2,050 pounds; big, fine, good style and action and sure foal getters; plenty of colts to show. Or would exchange one for a big young jack. Reason for selling, have adopted the Capsule System of breeding and have them to spare. **Henry Goertzen, Henderson, York Co., Neb.**

TWO YOUNG PERCHERONS.

Home-grown stallions; registered; one gray coming three years old; one black coming four years old; big, rugged and with unusual bone; raised in the rough. State certificates of clean soundness and health. I am anxious to move them. Chariton is in south central Iowa, with good railroads all directions. FRED CHANDLER, R. 7, Chariton, Iowa.

IMPORTED PERCHERON STALLION

For sale; 8 years old; a good breeder, with colts to show. Will sell very cheap if sold soon. F. R. HOWARD, Anita, Cass County, Iowa.

TWO PERCHERON COLTS.

Two years old past; dark grays; and two yearlings, also grays. Prices to close them out at once. **H. H. Koth, Monona, Clayton County, Ia.**

20 REGISTERED PERCHERON

stallions and mares for sale; might exchange for other stock. **J. D. Putman, Saline, Mercer Co., Mo.**

ONE REGISTERED PERCHERON STALLION

and one Percheron grade stallion. Will sell either one of them at a price within reach of all. For particulars write to **Ben Siefers Claflin, Barton County, Kansas.**

IMPORTED AND HOME BRED STALLIONS.

I will sell imported stallions, $800 to $1,000, except two stallions. Home bred stallions, $300 to $600. Come and see my horses. **Frank L. Stream, Creston, Iowa.**

IMPORTED PERCHERON STALLION

for sale; second prize winner at Nogent. Also span of imported mares at a bargain. **J. J. McNiff, Luverne, Rock County, Minn.**

BELGIAN STALLIONS

for sale. Two Belgian stallions coming two and three years old. Both state fair winners. Write for photo and further description to **C. W. McDermott, Wiota, Cass County, Iowa.**

REGISTERED IMPORTED SHIRE STALLION

for sale. Weight 1,900 pounds; sound and right in every way; sure breeder, can show colts. Formerly sold for $1,600. Priced right or will trade for cattle. **C. R. Trunx, Cimarron, Gray County, Kansas. Box 12.**

FOR SALE 300

200 Percheron stallions;

100 Percheron mares;

all ages and prices (50 herd headers.)

Singmaster & Sons, Keota, Keokuk County, Ia.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

THICK WIND—What is good for a horse that is a little thick in the wind? —Michigan Subscriber.

REPLY—So much depends on the abnormal condition that causes the difficulty in breathing that we do not believe we are justified in attempting to outline a course of treatment for your horse for the reason that it would perhaps prove disappointing to you. It would be far better to have the animal examined by a competent veterinarian with a view of learning the nature of the trouble and then decide whether or not attempted treatment is justifiable.

FEEDING SORGHUM—Is there any danger of causing a mare or jennet to abort by feeding sorghum cane hay, or sorghum cut and shocked as corn? I had two jennets that I thought were in foal last year; fed part of the winter on sorghum and they failed to prove in foal this year.—Tennessee Subscriber.

REPLY—There is very little danger of any sweet, wholesome provender causing abortion provided it is fed in proper quantities. Most of the abortions tracable to forage are induced by feeding forage that is mouldy or spoiled, or feeding in quantities that derange digestion.

SWEENY—I have a mare with a shrunken shoulder just the same as sweeny except the hide is loose. The cause I think was too large a collar. What is the best thing to do for her? She is in foal.—Kansas Subscriber.

REPLY—If you have already resorted to treatment such as stimulating liniments or vesicants without appreciable improvement you will gain time by taking your mare to some good, qualified veterinarian who will perhaps employ methods that would hardly be safe in the hands of one not conversant with surgical measures.

WORMS—Give remedy for worms in weaned colts.—North Dakota Subscriber.

REPLY—Your request does not give us a hint of the variety of worms complained of and remedies have to be used in accordance with the type of pest contended with. As a general rule a purge of aloin serves a good preliminary treatment, inasmuch as it serves to flush out the bowels and its action carries out many of the worms and eggs. Weanling colts may be given from one to three drams, which may be dissolved in a little warm water and given by means of syringe by the mouth. After it has acted, give in the feed, three times a day one-half teaspoonful of dried sulphate of iron for a week. During the treatment see that the animal has laxative food. This line of treatment, together with care as to clean provender, usually serves to rid horses of the class of worm that are ordinarily present.

CURBY HOCK—Please inform me what to do for my colt which was born with a curby hock on one leg, which at the age of one and a half years developed into a regular curb, not laming it, but looks bad. The colt is large, thrifty and very well bred.—North Dakota Subscriber.

REPLY—We doubt if it is advisable to undertake to treat a condition that is apparently due to a congenital defect in conformation. The enlargement might be reduced somewhat by daily applications of tincture of iodine which should be kept up until the

(Continued on page 10).

31 PERCHERONS

Must Be Sold at Once

We have sold our farm, and must give possession January 1st, 1913. This makes it necessary that we should sell our Percherons, the result of many years of intelligent breeding.

We are offering for quick sale, 18 Brood Mares; 12 Stallions, coming three years; and one Stallion coming four years. These Mares are among the best in America. The Stallions are mostly the get of Alban 46137 (64433).

Come and see these Grand Percherons, or write for list.

QUESTIONS AND ANSWERS.

(Continued from page 8).

parts have been considerably irritated: then discontinue for a week or ten days and the treatment repeated.

SWEENY—I have a fine three year old which was badly sweenied last spring; shoulder was sunken from top to bottom; stopped working it and turned it in pasture for the summer. As yet there is very little recovery.—North Dakota Subscriber.

REPLY—A case of sweeny that shows no inclination to recover with rest such as you mention should be treated by a competent veterinarian who perhaps will either insert setons or inject agents by means of a hypodermic syringe into the parts. We do not believe you would care to undertake either of these lines of treatment yourself, hence the above advice.

LAME HORSE—I have a horse that has been lame from some unknown cause for two months and I cannot find where he is lame and I have had some very good horse men pass him up not knowing where he was lame. He puts his foot down and puts his weight on it; the toe hits the ground first; he sort of slides his foot to where he steps; it is in his left hind leg.—Arizona Subscriber.

REPLY—Your limited description does not enable us to form a conclusion as to the parts affected that are causing the lameness mentioned and it would be folly on our part to suggest anything in the way of treatment until such diagnosis could be made. Secure the services of a good veterinarian with the privilege of a personal examination of the case in question.

PURGATIVE WANTED—Kindly let me know the best medicine to give to open a horse's bowels, quick; something in a liquid form that can be given with a syringe in the mouth.—South Carolina Subscriber.

REPLY—The prompt acting purgatives are not usually safe medicines in the hands of those not familiar with their peculiar actions. For ordinary purgative purposes one-half ounce of aloin may be suspended in two ounces of warm water and given with a syringe by the mouth.

CROOKED FETLOCKS—I have a filly three months old; her hind ankles turn out and she seems to walk on the outer side of her hoof. Can anything be done to straighten her ankles, or make her feet level? One foot not so bad as the other. As she is a registered Percheron I am anxious to get her feet in shape if possible. How old must a colt be before one could put on shoes? Would it do to put on a half or two thirds shoe so as to build up the outside of the foot, then rasp down the inside of the foot? Wouldn't that have a tendency to throw the ankle in and thus make the foot level? —Washington Subscriber.

REPLY—The method usually pursued for straightening crooked fetlocks consists of reducing the wall on the high side and permitting the other to grow unmolested. As a rule if this is done from time to time in growing stock the fetlocks can be straightened in eight to twelve months' time. The straightening process should be done gradually so as not to place too much strain upon the binding ligaments of the parts. In some cases it is well to apply a shoe after first lowering the high side and set it full on the side that the animal wears down most and also set it back a little from the wall on the high side. The

Trumans' Champion Stud

Our second Importation this fall

Left LONDON on MINNEWASKA Oct. 19. J. H. TRUMAN says they are the GRANDEST LOT of SHIRE HORSES that ever crossed the ATLANTIC OCEAN,

Our August Importation

Consisting of the most Sensational Shire, Percheron and Belgian Stallions imported this year, are now in first-class condition, and all for sale. The coming season is our 35th anniversary in the importing business, and during that period the name "TRUMAN" has stood for all that is straightforward and honorable, and we have not found it necessary to change our mode of doing business or our guarantee, which, as usual, is most liberal and good as gold. Imported Shire and Percheron mares of outstanding individuality for sale.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us. At the great Bushnell Horse Show the champion Shire stallion and mare, champion Percheron stallion and mare and champion Belgian stallion were imported by us.

"What More Proof is Necessary?"

Address for catalogue and other information, mentioning the American Breeder.

Trumans' Pioneer Stud Farm

Bushnell, Illinois

IMPORTED STALLIONS

PERCHERON
SHIRE BELGIAN

Each year we show our New Importation the same month they land; each year they win more than all other exhibitors combined. At the American Royal this year we won 2nd on 4-year-old Percheron, 1st, 3rd and 4th on 3-year-old; 1st and 3rd on 2-year-old and 1st and champion on group of five stallions. All are for sale. Our guarantee and insurance are the best. Our horses the best.

PERCHERON IMPORTING CO. CHAS. R. KIRK SOUTH ST. JOSEPH, MO.

Belgian Emporium of America

Stallion Blankets

Made to Order—Get a Fit

A good, substantial blanket is a necessity for all valuable animals. Our blankets are treated with a preparation to prevent horses from tearing them. In ordering, send measure from top of collar to the tail and heart girth measure. We can fit any horse, jack or mule.

Blankets made of best heavy material, substantially lined. Surcingle material sewed to blanket to prevent tearing. Leather front fastener. Express paid. Price each, $4.00; three blankets for $10.

Kansas City Impregnator Co.

12th and Central Sts. Kansas City, Mo.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG

Assumption, Christian County, Illinois.

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.
SPOHN MEDICAL CO.,
Chemists and Bacteriologists,
Box 834. Goshen, Ind., U. S. A.

object is to place the shoe more nearly under the center of gravity of the foot, as primarily it will be seen that in the process of wear there has been a radical departure from proper support.

DOUBLE GUARANTEE.

A large number of breeders have purchased stock in the Graham Publishing Company; these purchases are from one to ten shares each. We will not sell more than ten shares to any one and then only to live stock breeders. The object is to scatter this stock out as much as possible. If we had cared to sell this stock in blocks from $500 to $1,000 it would all have been sold before this. This is the reason that the sale of this stock may seem slow. It would not benefit the American Breeder to sell this stock in large blocks, but the object is to have working partners in as many localities as possible. While it is not necessary that we sell any stock, there are some improvements that we could make with the added money, and broaden the service to our readers. The stock holders are doubly interested in this.

The proposition is to sell the remainder of the $10,000 worth of stock in the Graham Publishing Company which is non-assessable, according to the Missouri laws. This stock is guaranteed to pay ten per cent income for two years, at which time the purchaser can return the stock to the Graham Publishing Company and get back full purchase price if he desires.

This $10,000 worth of stock is guaranteed by the other $40,000 worth of stock, so that the $10,000 worth of stock must receive a dividend before the owners of the $40,000 worth receive anything. This makes the purchaser safe in every way. At the end of two years the purchaser can decide whether he wishes to retain his stock or not.

Those who purchase stock now will receive their first dividend of ten per cent next May. A lot of breeders who have idle money could invest in this proposition much better than to put it in a bank, on time deposit, at two or three per cent.

Frank B. Graham has invested about $40,000 in cash in the American Breeder. This money has all been used to a good advantage. Every one acquainted with the newspaper business knows that it takes good times and money to establish a publication, and when properly conducted there is no other legitimate investment that pays better dividends.

The American Breeder occupies a peculiar field in which it has practically no competition. All our readers know what a wonderful success has been achieved. Those who care to take from one to ten shares are invited, but we must know that the purchaser is a breeder of live stock. We want all the stock in the Graham Publishing Company to be owned by breeders so that we can advertise to the world that the American Breeder is owned and managed by breeders The shares of stock are for sale at par value—$10 each. In making your order for stock, the following coupon may be used if desired:

GRAHAM PUBLISHING CO., INC.,
225 West 15th St, Kansas City, Mo.

I want ..... shares of the Graham Publishing Co. non-assessable stock at $10 per share, and enclose

$..... to pay for the same. I make this purchase under the double guarantee set forth above—the stock to pay me 10 per cent dividend for two years and to be taken off my hands at par at the end of two years, if I so desire.

Write full name and address below.

The average farm prices of important crops (corn, wheat, oats, barley, rye, flaxseed, potatoes, buckwheat, cotton and hay, which represent about three-fourths of the value of all crops) declined 8 per cent from October 1 to November 1, which compares with a decline of 3.6 per cent during October of the past four years. On November 1 the average of farm prices of the above named crops was about 12.8 per cent lower than on like date of 1911, 3.2 per cent lower than in 1910, 8.5 per cent lower than in 1909, and 1.1 per cent lower than in 1908 on November 1.—Victor H. Olmsted, United States Department of Agriculture, Bureau of Statistics.

LIGHT YOUR OWN HOME with a Self-Operating Electric Plant

This electric plant absolutely operates and controls itself. The difference between the minimum and the maximum voltage will start this plant in operation. All you need to do is to furnish Gasoline, Oil and Water and the plant will do the rest.

NO CRANKING OF THE ENGINE, the Automatic Switchboard attends to that. You can leave your home with perfect safety, leaving part of your lamps burning. They will not discharge the Batteries. You will find the Batteries in the same condition on your return home as when you left them. The Automatic Switchboard (the "Engineer," left in charge) will take care of the Batteries during your absence; the Automatic control for the Gasoline supply turning it on when in operation and cutting it off when Engine is shut down; the Electric Oiling Device, opening up and shutting off the oil supply.

We would be pleased to hear from you and if it is your intention to purchase a Light Plant for your home, at some near date, we would be glad to have the courtesy of an opportunity to explain the merits of this wonderful invention.

THE STEEL MANTLE LIGHT CO.
379 Huron Street Toledo, Ohio.

He Was Amazed at LOW COST of Edwards STEEL Shingles

"In all my life I was never so surprised" writes Mr. D. V. Elzroth, of Fosters, Ohio, "as I am at my new *Edwards* STEEL Shingle barn roof. I wouldn't have believed it if I hadn't seen it with my own eyes. Your steel shingles cost *lots* less than wood and they sure beat wood shingles and that rubber roll roofing *forty miles*. The stuff got here in *good shape*, right *on time* and I done the work myself. I've got the best roof in the township. What a fool I was not to get your catalog 4 years ago when I roofed my *house*."

Factory Prices—All Freight Paid!

Fire-proof, rot-proof, rust-proof. Guaranteed against *lightning* by $10,000 Bond.

Never need repairs. Out-last *three* wood-shingle and *five* composition roofs. Lowest factory prices—all freight paid. Put them on yourself. Made of Open Hearth Steel, *finest quality*. Made absolutely rust-proof by our world-famous "Tightcote" Process. Come in sheets, 24 inches wide, 5 to 12 feet long.

Nothing to do but nail sheets on old roof or sheathing. Edwards Patented Interlocking Device covers all nails, makes permanent watertight joints.

Makes handsomest, most lasting roof in existence. Write us. If possible give size of roof and we will quote price, delivered to your station.

Postal brings catalog 1176 and factory prices by next mail.

THE EDWARDS MANUFACTURING CO.

The World's Largest Manufacturers of Steel Roofing (87)

A $250,000 CATTLE CORPORATION.

The recent organization of the International Cattle Co., chartered under Kansas laws, is another evidence of the general prosperity now returning to the pure bred cattle business, as it shows the incorporators' faith in the future of the industry. This new company, which is capitalized at $250,000, has for its objects, as stated by the president, Mr. Richard A. Morley of Chicago, the encouragement of the scientific breeding of pure bred cattle, by showing the small as well as the large farmer that it is more profitable to breed a pure bred cow than to breed a common or inferior grade or scrub cow; to scientifically assemble small foundation herds; to furnish a place where those desiring to purchase pure bred animals can do so, and to furnish a market where the large or small breeder can sell his product at any season of the year.

The company will do a great deal of general farming and will maintain several large farms. The first of these is a thousand-acre property near Olivet, Kas., owned by Mr. Morley until sold to the new company. The company is now arranging for a smaller farm near Kansas City, which will be fitted up for holding and showing cattle. C. H. Makin of Grandview, Mo., well known to Hereford Journal readers, will be connected with the company, as manager of the pure-bred cattle department.—American Hereford Journal.

LIVE STOCK SUPPLIES SHORT.

(Continued from page 4.)

red in a number of years, and they are facing a season of light supplies. That in itself is enough to make a good market. But they have a period of practically seven months that will have to be supplied with short runs. Quality will be much better than last year owing to the abundance of feed, and the only prospect for increased supply must come from increased average weight of cattle.

The bulk of the short fed cattle now are selling at $7.75@9.25, and above that price it requires pretty thick flesh and finish. Chicago's highest price in the past two weeks was $10.85 and the other markets showed nothing above $10.25. Christmas beeves from the first to fifteenth of December will uncover record prices. The grassers are being closed out at $5.50 @7.75 on the native side, and at $4.50 @6.35 for quarantine cattle.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.50@10.85
Good to choice steers	8.25@ 9.45
Fair to good steers	7.75@ 8.20
Common to fair steers	5.00@ 6.70
Meal fed, choice	7.25@ 8.25
Meal fed, common to fair	5.25@ 7.20
Grass fat	4.50@ 7.75

Canners at Record Prices.

Cows, during the past two weeks, were in active demand with prices rising slowly. The unusual high level at which they have been maintained for some time past has made a further rise come by easy stages. "Canner" cows are selling at $3.25@4.25, and cutters at $4.30@5. In both cases hides have been a big consideration, as hides of all descriptions are bringing unprecedented prices. The good butcher cows are selling at $5.25@6.75. Practically no fed cows have been offered. Some fed heifers sold as high as $8.50. The next few weeks will see increased receipts of short fed she stuff. Veal calves were quoted up 50 cents; top price, $10. Choice light weight grades are scarce. Bulls are 25@50 cents higher.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.25@7.00
Fair to good	4.75@6.20
Common to good	4.25@4.75
Canners	3.25@4.25
Heifers—	
Choice fed	8.25@9.00
Good to choice	6.25@8.25
Common	4.25@5.25
Plain to fair	5.25@6.20
Veal calves	5.00@10.00
Bulls	3.50@6.25

Feeding Cattle Still Wanted.

Demand for stockers and feeders continues uninterrupted. Prices have shown firmness all along the line, and all classes of cattle have been in about the same request. Western states are taking light weight cattle that can be carried through the winter and turned on grass in the spring, while to the East they still want the weightier kinds for feeding. Stock calves, cows and heifers continue to sell freely.

The following quotations are for stock and feeding cattle:

Selected feeders	$6.65@ 7.50
Good to choice feeders	5.75@ 6.60
Plain to fair feeders	5.25@ 5.70
Selected stockers	6.45@ 7.00
Good to choice stockers	5.50@ 6.40
Plain to fair stockers	5.00@ 5.50
Stock calves	5.00@ 7.00
Stock cows	3.85@ 4.75
Stock heifers	4.00@ 5.50
Milch cows	35.00@90.00

Exceptionally good terms and will take good income property for 25 per cent of purchase price on any of the above. Cord C. Smith, 125 No. Kansas Ave., Topeka, Kas.

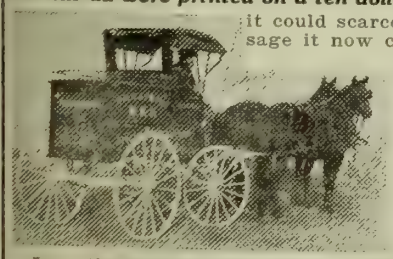
A Good Eastern Kansas Farm

of 157 acres; 50 miles south of Kansas City; well improved, for sale or will trade for registered horses. Address Box 16, Paola, Kansas.

THE BIGGEST BARGAIN OUT.
40 ACRES FOR ONLY $300.

Forty acres 3 miles from Belleville, a good town on the main line of the Rock Island Lines, 5 miles from Danville, the county seat, 8 acres cleared and in cultivation, 20 acres or more can be tilled, the balance for fruit or pasture, branch bottom and upland (not hilly), about 15 acres of ridge land with a north slope which would make a fine orchard; a good deal of this land is level and clear of rocks, but as a whole it has some surface rocks in spots; 3 room box and log house; barn and hen house; good well of soft water; one-half mile to school; near the main line public road; good level roads to town; good out range for stock; good neighborhood and in a very healthy location. Price only $300 cash; no trades; title perfect; possession given any time. If you want this place wire or write me to hold it until you can come to look at it. This place will be sold quick and you had better act now. If you can't come I will send the deed and abstract to your bank with draft attached. John D. Baker, Danville, Yell County, Ark.

AN IMPROVED AND SEVERAL RAW QUARTERS



of good land for sale or trade for stock or anything worth the money. Jos. J. Ernesti, Goudyville, Hyde County, S. D.

Winter Hog Packing Season Begun.

The winter hog packing season began about two weeks ago, but thus far the packers have been able to keep a string on it. As long as prices keep under $8, the packers are willing to buy hogs, but the minute the market approaches that level they withdraw from the competition. In the past two weeks hog prices held above $7.50, and below $8 most of the time, though some $8 sales were recorded at river markets, and as high as $8.30 was paid in Chicago. Receipts have not been large and packers have depressed prices at the expense of supplies. The quality of the offerings is slowly improving. Weight is coming heavier than a year ago, and fewer sick pigs are being received. Packers figure a good season ahead as weight will be heavy and to some degree offset the shortage in the supplies. Heavy hogs now command a premium over other weights. Compared with two weeks ago, prices last week averaged about the same, though prices held within a narrower range.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Nov. 11...	$7.40@7.75	$7.60@7.90
Tuesday.	7.40@7.75	7.65@8.00
Wednesday	7.50@7.85	7.50@7.85
Thursday.	7.50@7.90	7.60@7.90
Friday.	7.45@7.85	7.65@8.00
Saturday.	7.45@7.85	7.40@7.80

The following quotations are for hogs:

Choice, 250@300 lbs.....	$7.75@7.85
Choice, 20@300 lbs.....	$7.75@7.85
Choice, 200@245 lbs.....	7.65@7.82½
Medium weight	7.50@7.75
Light weight	7.35@7.70
Common to fair	6.35@7.40
Stags.	6.15@7.65
Boars.	4.75@7.00
Bulk of sales	7.60@7.80

Break and Recovery in Sheep.

In the past two weeks sheep prices broke and recovered the loss, and at the close last week were about net unchanged compared with two weeks ago. Receipts have been fairly large, but carried the final shipments of range grassers and the wind-up of the native sheep. From now on killers will have to depend on fed grades. Fewer sheep are on feed in the corn belt now than a year ago, and Colorado appears to be the only state that will have normal supplies. Higer prices are expected in the next two weeks. Choice lambs are quoted at $6.50@7.50, yearlings, $4.75@5.50; wethers, $3.75@4.65; ewes, $3.50@4.25; feeding lambs, $4.75@6.40, and feeding sheep, $3@4.

BREAKING MORE MILK RECORDS.

A California Holstein cow, Riverside Sadie de Kol Burke, has broken a world's record in milk production. For the first six months of the second year's test, Riverside Sadie de Kol Burke yielded 18,275 pounds of milk. In a year Aralia de Kol, a 12-year-old cow of the same locality, has yielded 28,065.9 pounds of milk, containing 910.18 pounds of butter fat, equivalent to 1,137.73 pounds of butter on the 80 per cent basis, or an average of over three pounds of butter per day for the year.

DRAFT HORSES.

Jan. 28-31, 1913—C. W. Hurt, Mgr., sales at Bloomington, Ill.

Chas. Irvine, the well known breeder of Belgians at Ankeny, Iowa, starts his advertisement in this issue. Mr. Irvine writes: "We have a new lot on hand and they are the best all around bunch I have ever had to offer. Mares in foal, also foals and yearlings, all in condition to do the best for their buyer. We also have a few very fine stallions from one to five years old and weigh from 1450 to 2350 pounds. Our prices are moderate but we don't handle a cheap kind of a horse. All stock as represented and must be seen to be appreciated."

One of the biggest collections of stallions and mares ever offered to buyers of Belgians in this country is now ready for inspection in the barns of H. Lefebure, Fairfax, Iowa. Mr. Lefebure is a pioneer in the Belgian business and the growing popularity of the breed proves that a class of horses have been brought to this country deserving of a liberal patronage. To accommodate his Belgian customers who also want Percherons, Mr. Lefebure has bought a carload of black and gray Percherons. Fairfax is only eight miles from Cedar Rapids, Ia., and the Lefebure farm is easily reached by any of the railroads at that point or by the Iowa City Interurban, as explained in the advertisement in this issue.

If you have some registered cattle that you would like to trade for good land in Texas, get in touch with Lawrence Johnson of Summerfield, Tex. He also has a good automobile that he would like to exchange for cattle. Read his ad.

Some splendid bargains in the way of stallions and jacks are offered in this issue by G. W. Newman, Elvaston, Ill. Mr. Newman wants to quit the business and is anxious to dispose of this stock as early as possible. It surely would pay anyone in the market for stock of this kind to investigate what Mr. Newman has for sale.

Frank Dykins of Yates, Mont., is advertising a good 320-acre farm for sale in this issue. See what he says in his ad and then write him.

If you are in the market for a good young Percheron colt, you might find just what you are looking for by writing H. H. Koth, Monona, Ia. He has two good ones advertised for sale in this issue.

H. T. Brown & Co. of Lexington, Ky., start their advertising in this issue. Anyone in the market for jacks or Percherons would do well to get in touch with this reliable firm.

If you are in the market for a big black jack it would undoubtedly pay you to get in touch with Edwin Nichols of Morrill, Neb. He is advertising a good one for sale in this issue.

E. M. Browneller of Deweyville, O., is advertising a black Spanish jack for sale or trade in this issue. If interested it might pay you to investigate.

An imported German Coach stallion is being advertised for sale by J. C. Walvoord, Holland, Neb. Mr. Walvoord will sell this stallion at a bargain to an early buyer. Look this up.

If you want to trade cattle, draft mares or mules for a good Mammoth jack, read the ad in this issue of Martin Weland, Walford, Ia., and write him for particulars.

Two good young Percheron stallions are offered for sale in this issue by Fred Chandler, Chariton, Ia. Read the ad and then write Mr. Chandler for further particulars if you are in the market.

A good bargain in the way of a Percheron stallion is offered for sale in this issue by F. R. Howard of Anita, Ia. Mr. Howard will sell this stallion very cheap to an early buyer.

If you are in the market for Shorthorn cattle it would undoubtedly pay you to see what C. H. White of Burlington, Kas., has for sale. He is also advertising a few young Poland China boars. Read his ad.

R. J. McNee of Idana, Kas., is advertising in this issue two black jacks for sale and a draft horse for sale or trade for jennets. If in the market, don't fail to write him for full particulars.

If you are looking for a good farm write to R. J. McNee, Idana, Kas., and see what he is offering for unimproved land.

G. M. Scott of Rea, Mo., starts his advertisement in this issue. Mr. Scott says he is offering the best lot of jacks he has ever had on his farm. This means much to jack buyers. Write him if in the market.

Mr. Felix Smith of Downs, Kas., is advertising his Arabian spotted stallion for sale in this issue; also a standard bred stallion. Read his ad and write for full description.

Do not fail to look up the advertisement in this issue of the KKK Medicine Co., Keokuk, Ia. If you are looking for a "side line" this might be just what you want. Write them for full particulars.

J. D. Putman of Saline, Mo., is advertising in this issue 20 Percheron stallions and mares for sale; he states that he might exchange for other stock. It might pay you to write him.

One Percheron stallion and seven jacks will be sold at public sale December 3, by W. C. Robbins, Munden, Republic County, Kas. The stallion is a gray, 9-year-old, imported, and a good breeder. The jacks are described in the advertisement. Be sure to see it and write Mr. Robbins for any needed information.

H. A. Greenwell of Lakenan, Mo., starts his ad in this issue. Mr. Greenwell has a very fine collection of saddle stallions of the famous Rex McDonald breeding. Read the ad.

Two imported Percheron stallions are offered for sale in this issue by Henry Goertzen of Henderson, Neb. If you are in the market for a stallion, it would pay you to investigate what he has.

Read the advertisement in this issue of Isaac C. Lohman, Turney, Mo., and you might find what you are looking for.

Remember J. H. Decker's public sale of imported Percherons to be held at Piper City, Ill., December 12. Write him at once for a catalogue, mentioning the American Breeder.

Remember D. K. Roth's public sale of Percherons and Belgians to be held December 13 at Gibson City, Ill. Write him at once for a catalogue, mentioning the American Breeder.

Remember the annual sale of imported Shire and Percheron mares to be held December 12 and 13 at Trumans' Pioneer Stud Farm, Bushnell, Ill. Write them at once for a catalogue, mentioning the American Breeder.

On the back cover of this issue will be found the advertisement of the Hudson Motor Car Co., Detroit, Mich. We hope every one of our readers who is interested will write this company for a catalogue, and mention the American Breeder.

Everywhere in the West buyers for Percheron stallions and mares should keep in mind the public sale of Lee Bros. of Harveyville, Kas., which will be held at the Kansas State Agricultural College, Manhattan, Kas., December 17. In this sale will be included the champion Percheron mare, Galette, and her prize winning teammate, as well as a first prize American bred stallion, a reserve champion stallion and a large number of other good ones including ribbon winners. The show stud of Lee Bros. was shown at the Western state fairs this year and the sale ought to attract many buyers. Read the advertisement in this issue and send at once for a catalogue, mentioning the American Breeder.

Every year the Percheron men from the Mississippi river to the Pacific ocean watch for the public sales made by J. C. Robison. Mr. Robison's sale to be held at his farm at Towanda, Kas., December 19, will include 50 Percheron stallions and mares—nearly all from his recent importations. Mr. Robison's trade has become so heavy that it has been necessary for him to make these importations in order to keep on hands a sufficiently large number of high class animals, and this public sale to be held December 19 will be the buyers' best opportunity to make a selection from his imported blood before the stock has been picked over. Send at once for a catalogue, mentioning the American Breeder.

Something entirely new in a colt show and public sale of breeding stock will be held December 3d at Herkimer, Kas., by Otto Westerman. The event will open with a big show of colts sired by Mr. Westerman's breeding stock and will be followed by a public sale in which a Belgian stallion and some lighter stallions and several good jacks will be sold.

One of the season's outstanding opportunities for buying Percherons is offered in the advertisement of the Patterson-Erickson Company of Worthington, Minn., to be found in this issue. This firm has sold its farm and buildings and must give possession January 1. In order to do this special prices are being made on 31 Percherons—18 mares and 13 stallions. This stock is all high class, the mares being reserve breeding stock and the young stallions mostly the get of the famous imported stallion, Alban 46137 (64433).

MISCELLANEOUS HORSES.

WHAT DO YOU WANT? Mares, stallions, jacks, saddlers; standard bred stock of all kind. The best is not too good. I WANT Percheron stallion, extra good and an extra good jack. **Isaac C. Lohman, Turney, Clinton Co., Mo. Rte. 3.**

Will sell at a bargain; half cash; balance good notes. Write or come and see. **T. M. Vandevier, Peak, Garland County, Ark.** Peak is 20 miles west of Hot Springs; one mile postoffice.

Owners of valuable horses should provide themselves with blankets at once. The best proposition in this line we have ever seen offered is being advertised by the Kansas City Impregnator Co., in this issue—made to order blankets treated with a substance which goes a long way toward keeping horses or jacks from nipping and pulling at them. Read the advertisement carefully and make your order without delay.

We are especially glad to call attention to the new advertisement of Taylor & Jones, importers of Belgians, Percherons and Shires at Williamsville, Ill. Here is a firm which has long ranked among the leaders in the draft horse business and with a record for square dealing second to none. We are glad to advise our readers to investigate what Taylor & Jones have for sale.

There is a horse remedy which, while it may not be generally appreciated on the farms of this country, is well known to professional horse dealers and feeders everywhere, and there are hundreds of barns at the main city markets which are never without this remedy. It is known as "Dyer's Specific," and is manufactured and sold exclusively by the Ward Drug Co., Stock Yards, Kansas City, Mo., as per advertisement in this issue.

The fact that C. W. Lamer & Co. have a big importing and breeding barn at Salina, Kas., full of good Percherons, Belgians and French draft stallions and mares, should never be lost sight of by intending stallion buyers in the West. Mr. Lamar's advertisement which regularly appears in the American Breeder, gives a synopsis of his season's winnings at the leading Western fairs and shows that he has one of the largest collections of registered stallions and mares in America for the buyer to choose from.

Note especially the change in the public sale advertisement of W. S. Corsa's sale of Carnot Percherons to be held at White Hall, Ill., December 10. By his own winnings and the money he has sold for, and the winnings of his colts the past two years, Carnot has established himself as the premier Percheron sire of America. It is only a bare statement of facts to say that Percheron breeders will watch the sale of W. S. Corsa with greater interest than almost any other event of the year. The advertisement referred to gives some of the main points about the offering, but every reader should send for a catalogue at once. Mr. Corsa asks that in writing each inquirer mention the American Breeder.

The lighting of farm homes has opened a very important field to manufacturers and some of the best equipped plants in America are putting in apparatus for this purpose. One of the very best things in this line we have ever seen is advertised in this issue, is an automatic electric light plant. It not only has the advantage of providing the safest and most modern illumination known, whether in city or country, but it provides it by means of a plant at reasonable cost which practically runs itself. The advertisement gives some particulars and everyone who has the home lighting problem to solve should write at once to this firm for further information, addressing Automatic Electric Light Company, 221 Admiral Blvd., Kansas City, Mo., and be sure to mention the American Breeder.

Bell Bros., of Wooster, Ohio, will be at the International Live Stock Show in Chicago, November 30 to December 6 with one of the finest exhibits of Belgians they have ever taken out. All their old friends, and any new friends who enjoy looking at typical specimens of this great breed are invited to visit Bell Bros., at their stalls, and to see their horses in the show ring, too.

The manufacturers of Absorbine, advertised regularly in these columns, have sent us the following letter from one of their customers: "I am anxious to relate to you the experience I have had with your Absorbine. I have been somewhat slow in writing you on account of waiting to see if the cure is permanent. I had a mare with an enlarged hock the size of your two fists which was caused from a bruise, and after doctoring for some weeks I concluded to use Absorbine. In less than a week the lameness was gone and the hock was entirely cured and is today clean and as strong as ever before. I used hot water and woolen cloths for steaming the hock once a day and rubbed the absorbine in thoroughly three times a day and it gave a quick, permanent cure. W. Austin Cope, Jerseyville, Ill."

J. G. Truman, Truman's Pioneer Stud Farm, Bushnell, Ill., writes: "During October we have made the following sales: To our old customer, Hugh McCormick of Sangamon County, Illinois, the imported three year old Shire mare, Pattie, winner of first at the Iowa, Minnesota, Wisconsin and Illinois state fairs this year. He also purchased the two year old prize winning filly, Crocus, and the dapple gray aged Shire mare, Diamond, weighing over 2300 pounds. We understand that these mares were very successful in winning prizes at the Sangamon County Institute last week. J. A. Burnhart of McDonough County, Illinois, purchased an Imported Belgian and an Imported Percheron Stallion. J. L. Gibson of Johnson County, Iowa, an Imported Shire stallion. To Messrs. Munce & Son of Logan County, Illinois, the champion American bred stallion at the Illinois State Fair this year. To Frank Hurrle of St. Cloud, Minnesota, an Imported Percheron stallion. This gentleman had visited no less than ten importing barns before making his decision. He was looking for one of the extremely heavy boned kind which he had no trouble in finding here. To the Sandwich & Millington Horse Company of Sandwich, Illinois, an Imported Percheron stallion. Messrs Summy & Co. of Linden, Iowa, purchased the Imported Shire stallion, Dunsmore Willing Boy, winner of first prize in the aged class at the Iowa State Fair. To Weaver & Rice of Wibaux, Montana, three Shire stallions and one Shire mare."

Wm. Crownover, importer and breeder of Shire Belgian and Percheron horses, at Hudson, Iowa, writes: "I have just returned from Europe with 41 head of Percherons, Belgians and Shires, two to five years old, weighing in their flesh 1800 to 2250 pounds. Every horse is selected with plenty of good hard clean bone and the best of feet pasterns and joints and absolutely sound. I have now 80 head on hand and can suit the most critical buyer who is looking for a high class horse at a reasonable price, and will guarantee not to be undersold, quality, size and soundness considered. I do not send out any "hot air" advertisements and will pay any man's expenses who comes here and can say that my stock is not as good as the best, or that I misrepresent them in any of my advertisements."

WEBSTER TO EDIT HOARD'S DAIRYMAN.

To the American Breeder:—E. H. Webster, dean of agriculture in the Kansas Agricultural College, has resigned. Dean Webster is to become associate editor of Hoard's Dairyman at Ft. Atkinson, Wis., beginning January 1. It is not likely that a successor will be appointed to fill his place in the present fiscal year or until after July 1. Dean Webster was graduated from the Kansas Agricultural College in 1896 and from the Iowa Agricultural College four years later. He has held various positions on the teaching staffs of the Iowa and the Kansas colleges and in 1903 was scientific expert in dairying in the United States Department of Agriculture and in 1905 to 1908 was chief of the dairy division in Washington. He came to the Kansas Agricultural College as dean and head of the experiment station in 1908.—Chas. Dillon, Kansas Agricultural College.

ANNUAL MEETING OF THE AMERICAN SHETLAND PONY CLUB.

To the American Breeder:—The 1912 annual meeting of the American Shetland Pony Club will take place in the afternoon of Tuesday, December 3, at 3:30 o'clock in Hotel Sherman, Chicago.

Shetland breeders are requested to make arrangements to come. Following the meeting, a banquet will be held allowing everybody to meet socially and have a good time.—J. M. Wade, Secretary-Treasurer, LaFayette, Indiana.

PUNTON - CLARK
PRINTING COMPANY
1024-28 WYANDOTTE STREET
KANSAS CITY, MO.

Print anything from a Business Card to a Catalog or Book. Best work, reasonable prices. Binding, halftones, zinc etchings, etc.

BREEDERS' PRINTING

STALLION AND JACK POSTERS, CARDS OF ALL SORTS, SALE BILLS, ENVELOPES, LETTER HEADS, LIVE STOCK CATALOGS, SHIPPING TAGS, ETC.

We are especially equipped with all kinds of cuts, paper, type and machinery for this class of work.

Send us your instructions in as good shape as you can and we will give you a good job and treat you right on the price. Address,

S. W. ANDERSON PRINTING CO.
225 West Twelfth St. Kansas City, Mo.

STALLION and JACK CUTS

We can furnish cuts for bills, letter heads and all kinds of stallion and jack advertising.
A New Line, True to Life, The Best Work, Prices Low.
Send for sample sheet and subscribers' prices.
N. B.—We do not do any printing. We simply furnish the cuts.

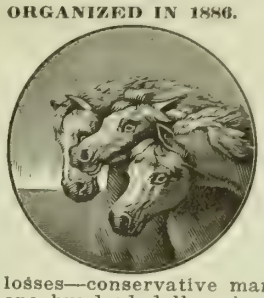
Live Stock Remedies and Insurance

BREEDING APPLIANCES



EVERY GOOD, RELIABLE ARTICLE WHICH JACK AND STALLION MEN NEED.

From Carlson Semen Extractors to Emasculators—the best of all the practical horse goods in this line at reasonable prices and no cheap rubbish at any price.

Write for our catalog of good goods.

KANSAS CITY IMPREGNATOR CO.
12th and Central Sts. Kansas City, Mo.

ORGANIZED IN 1886. PIONEER IN ITS LINE.

The Indiana and Ohio Live Stock Insurance Company
Crawfordsville, Ind.

Insures Horses, Mules and Cattle against loss by death from any cause. If animal gets leg broken and has to be killed, we pay the loss.
Oldest Live Stock Insurance Company in the world. Cash Capital $200,000.00; Assets $450,000.00.
Fair adjustments—prompt payment of all honest losses—conservative management. It costs less than two cents a day to carry one hundred dollars insurance on Farm, Family Driving and Saddle animals.
Secure a policy while your animal is in good health. Call on local agent or write Home Office at CRAWFORDSVILLE, IND.

DYER'S SPECIFIC FOR HORSE AILMENTS

TRADE MARK

REGISTERED

In constant use for ten years by successful horse and mule men for curing **Shipping Fever, Stable Fever, Lung Fever, Bronchitis, Colds, Colic and other diseases.** Note the following endorsement, a new one every time:

"Dyer Remedy Co., Kansas City, Mo. Gentlemen:—Out of ninety-eight head of horses just received from Kansas City, I have not had one of them get sick—something unprecedented. On unloading these horses, I shot a dose of your remedy in each one of them. Kindly ship me at once two dozen bottles of the same. It is great stuff. —J. W. Richardson, Morristown, Tenn."

WARD DRUG CO., - - Stock Yards, Kansas City, Mo.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

O. P. WILSON SERUM AND INSTRUMENT CO.,
3754 Wayne Avenue, Kansas City, Mo.

Don't Have a Blind One

"VISIO"

An Absolute Cure for Moon Blindness

(Opthalmia), Cataract and Conjunctivitis
Shying horses all suffer from diseased eyes.
"Visio" will convince any horse owner that it will absolutely cure defects of the eye, irrespective of the length of time the animal has been afflicted. No matter how many doctors have tried and failed, use "VISIO" under our GUARANTEE to refund money if it does not cure.
$2.00 per bottle, postpaid on receipt of price.
VISIO Remedy Ass'n, 2475 Calumet Ave., Chicago, Ill.

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.

New HUDSON "37"

Furnished Complete---No Extras to Buy

THE COMPOSITE MASTERPIECE OF 48 LEADING ENGINEERS

Men who have had a hand in building more than 200,000 automobiles of 97 well known makes, offer now the car which all joined in building---THE HUDSON "37."

It represents the best that each man knows. It is the composite of all these experts and expresses the development possible when the best engineering brains combine.

The Greatest Engineer of All---Their Chief

At the head of these experts is Howard E. Coffin, the foremost automobile engineer of America, recognized here and abroad as the most startlingly original designer the industry has produced.

His genius is an inspiration to his associates. From him they have gained in ability. On account of them he has become a broader and more versatile builder.

What one man lacked in experience, some of his associates was able to supply. The problems one was unable to solve, others soon found the answer for.

That accounts for the completeness of this car. That accounts for the fact that you will find on it the very things that you have wished to find on an automobile. That explains why this car will do the things which other four-cylinder automobiles have failed to accomplish.

Imagine what strides, what advancement, men of such experience are bound to offer in the car which all have joined in perfecting.

It is all in the one car. It expresses as nearly the limit of four-cylinder construction as has been reached.

Hadn't You Better Wait?

Even if you are impatient to have a new car now, don't you think it better to see the *New* HUDSON "37" before you buy?

No other car you can get this year, regardless of price, has all the features that are offered in the "37."

Consider for a moment the rapid advancement that has been made in motor car building. It is almost as startling as are the changes in fashion. Think how strange are the open cars of two years ago. What proportion of their original cost do you think such cars now bring? It is not due to wear that their value has declined so much. No, it is the advance that has been made in automobile building since the open cars were put on the market.

With that thought in mind you must recognize the importance of choosing wisely now. Automobiles as now built should be of service for many years and you don't want to feel that you will have to buy a new car in two, three or four years because the one you have just purchased will, at that time, be out of date.

Your Safety in this Choice

No one is likely to soon have many new ideas to offer that these 48 engineers have not already anticipated.

They all combine in saying that the *New* HUDSON "37" represents the best that there is in four-cylinder construction.

They proved every move they have made through 20,000 miles of gruelling country, mountainous, mud and snow driving.

The most abusive treatment one of the most skilled drivers could give in the thousands of miles he drove the car, without developing a single weakness, or discovering a single detail in which improvement could be made either in design, construction, simplicity, easy riding qualities, responsiveness, safety or power, is a guarantee that you will find it expresses your ideal of what a four-cylinder car should be.

Electric Self-Cranking—Electrically Lighted

Comfort, Beauty, Luxury

Every detail of comfort, beauty and luxury is included. You will find no other automobile to excel the "37" in these particulars.

It is electric-lighted throughout. The successful Delco patented self-cranking system, at the touch of a button within reach of your finger, and the pressure of a pedal, turns over the motor, for 30 minutes if necessary. Oil and gasoline gauges are on the dash.

There is not a single action in the operation of the car which cannot be done from the driver's seat.

Actual brake tests show 43 horsepower. Its rear axle is full floating. The rain vision windshield, the speedometer-clock, demountable rims, 12-inch Turkish upholstering and every conceivable detail of refinement, make it the most complete four-cylinder automobile on the market.

Models and Prices. Five-passenger Touring Torpedo or Two-Passenger Roadster—**$1875, f.o.b Detroit. Canadian price,** duty paid, $2425, f. o. b. Detroit. **One price to all—everywhere.**

Go and see about this remarkable automobile today at the nearest HUDSON dealer. Write us for complete details, photographs, etc.

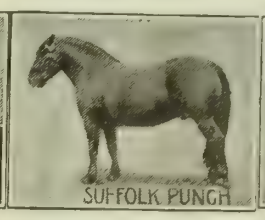
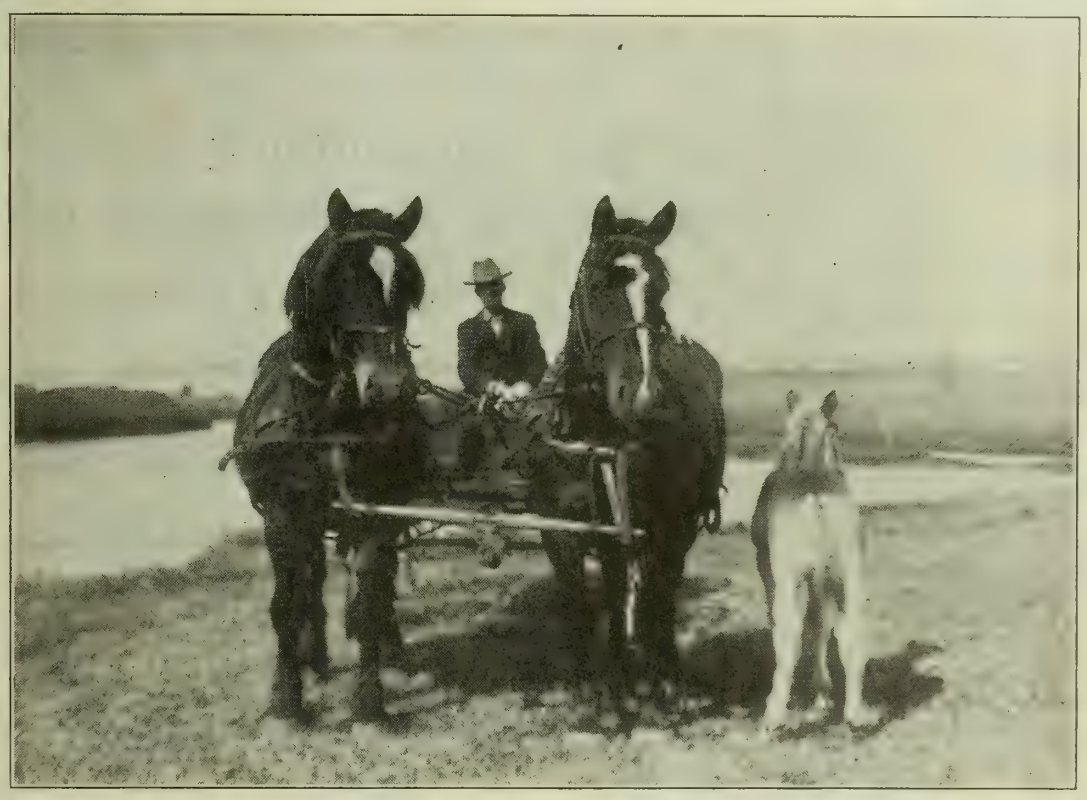
THE AMERICAN BREEDER

A Journal of Live Stock Improvement and Modern Breeding Practices

Subscription Price; $1.00 per year or $2.00 for three years, payable in advance.

Volume V. *Kansas City, Missouri, December 5, 1912* *Number 22*

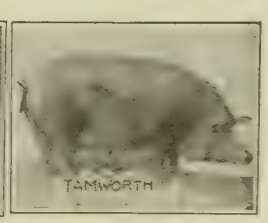




Value of Pure Bred Draft Mares

Mr. Milroy of Nebraska, owned a pure bred stallion. At our request he purchased a pure bred mare, completing the team shown above. The colt shown should be worth as much at two years of age as the original price of the mare. The labor performed by the mare should pay for her maintenance besides the value of the advertising that she and her mate will create, and the stimulation of the draft horse business in that community.

What is more business like and satisfactory than a handsome registered draft team with a good set of harness. Every owner of a registered stallion should not only study the advisability of purchasing pure bred mares himself, but should interest a number of his best customers in such an investment. Stallion owners can write to those holding public sales, sending them lists of the most progressive farmers whom he is trying to interest in pure bred mares, and ask these advertisers to send them catalogues. Such literature will interest a majority of these prospects.



Whenever pure bred stock is introduced into a community some public spirited citizen must not only take the lead but keep persistently at it. This means money to the stallion owner, not only in service fees, but in affording additional proof of the real breeding value of a good sire.

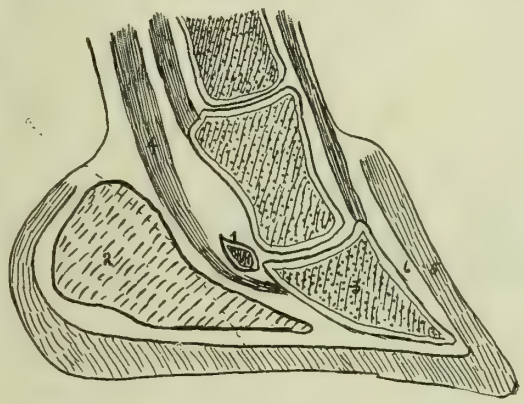
STUDY OF THE HORSE'S FOOT

A Vital Point Which Has Received Too Little Attention in the Quest For Less Essential Qualities. The Foot Described. Cautions For Shoers.

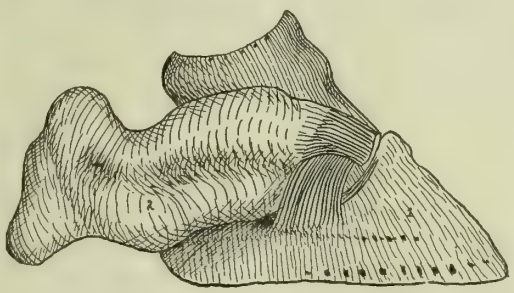
By Dr. C. W. McCampbell, Veterinary Department, Kansas Agricultural College.

SOMETHING over twenty-two centuries ago Xenophon, realizing the importance and value of good feet in a horse, gave to us the axiom, "No foot, no horse," and it is just as true and applicable today as it was then. That the average quality of the feet of our horses is very poor, irrespective of breed, cannot be denied. Evidences of this are seen upon the streets of our cities, upon our farms where the wear and tear is much less severe, and even in the show ring, where only the best individuals are shown. These defects of conformation and quality are physical characteristics and as such are being transmitted to the offspring. In each generation this character—poor feet—is being intensified in all our breeds of horses, especially the draft breeds. In our endeavoring to obtain size, quality, speed, and the other desirable characteristics, we have been overlooking the very first and most important requisites of a good horse—well shaped, strong, and durable feet.



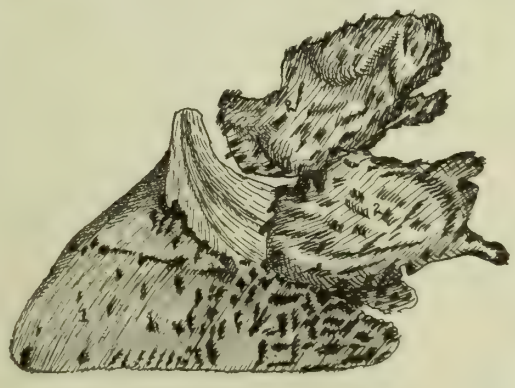
Possibly the reason this has been so badly neglected is due to a lack of understanding of the structure of the foot and the very important functions of its various parts. Surely no one who thoroughly understood the anatomy and physiology of the foot would so persistently ignore such a vital question. Therefore, a brief discussion of the anatomy and physiology of the principal structures of the foot may be of interest and may possibly help to show more clearly why feet of certain conformation stand the wear and tear of work-a-day life while those of other conformation do not.

The word "foot" implies the hoof, together with the bones and soft structures contained therein, and we may regard it as consisting of three well marked portions—the base or bony core, the non-sensitive protective portion, and the sensitive portion lying between and closely adherent to the other two.



In studying the hoof it is divided into three parts; the wall which supports the body weight; the horny sole which protects the sensitive sole; and the frog which acts as a buffer. If the wall were a complete circle it would be a rigid body and would be of little value in overcoming the jar and concussion incident to locomotion, but nature intended that it should be a yielding structure and accomplished this purpose by causing the circle to bend upon itself to form bars. The wall is thickest at the toe to compensate for the friction and strain due to the compression of propulsion which is greatest at this point. The thickness of the wall gradually decreases from the toe to the heel, thus giving the foot more elasticity in the posterior part. At any particular point in the circumference of the wall, it will be found to be of the same thickness from the coronet to the ground edge. The external surface of the wall is covered by a varnish-like layer called the periople, which is thickest at the top of the wall. This is a protection nature has provided to check evaporation and consequent cracking of the horn, and it should not be rasped away in shoeing.

On the inner surface of the wall there are five or six hundred parallel plates or processes of horn extending from the coronet to the sole. These plates or laminae are separated from each other by deep fissures and are dovetailed securely into a similar sensitive laminae or the sensitive portion of the foot, each of the non-sensitive laminae fitting in between two sensitive laminae to which it is securely cemented. In this manner the most perfect union is brought about between the inner sensitive structure and the horny wall.



The sole of a normal, well shaped foot is concave, the cavity being greater in the hind than in the front feet. One peculiarity about the growth of the sole is that its fibers grow downward from the sensitive sole within, and after reaching a certain length the ends break off, thus nature determines how thick the sole shall be. The union of the sole and wall is marked by a white line extending completely around the interior circumference of the hoof. The part of the sole immediately within this white line is capable of bearing weight as this part is not directly under the sensitive vascular sole, but it is not intended that the remainder of the sole shall carry weight. Its purpose is to afford protection to the sensitive structures just above it. The frog has the same microscopic appearance as the horny due to the amount of moisture it contains. The per cent of water contained in the different structures of wall, but its rubber-like character is an average normal hoof is as follows: Wall 25 per cent, sole 37 per cent, frog 42½ per cent. The frog is one of the most important parts of the anti-concussion mechanism of the foot and to serve its purpose best it must be healthy, large, and its inferior surface must rest upon the ground. If it does not come in contact with the ground, it wastes away, the heel contrats, the foot is rendered smaller, and the pad becomes diseased.

LONGITUDINAL SECTION OF HORSES FOOT
Showing—1, Navicular bone; 2, Plantar cushion; 3, Bone of foot, or Os Pedis; 4, Back sinew or penetrating tendon; 5, Wall of foot; 6, Sensitive laminae.

NORMAL CONDITION.
Showing—1, Bone of foot; 2, Lateral cartilage.

DISEASED CONDITION.
Showing—1, Bone of foot; 2-2, Cartilage ossified to form sidebones.

The sensitive portion of the foot is located immediately within the hoof, completely covering and securely united to the pedal bone, the planter cushion, and most of the outer surface of the lateral cartilages. It is known by various names such as corium, the vascular structure, the laminal tissue, etc. It is remarkable for its abundance of nerves and great blood supply. This rich blood supply gives it the apearance of muscle tissue. It is susceptible to congestion and inflammation as soon as the hoof which surrounds it loses its physiological properties. Any inflammation of the structure is always accompanied by intense pain, as swelling of these parts becomes impossible incased as they are in such a resisting envelope. This corium or sensitive structure is composed of a sublaminal base and 500 or 600 sensitive leaves or laminae, similar in form to the laminae of the inner surface of the wall extending from the coronet to the lower edge of the pedal bone. Microscopic examination shows that each of the sensitive laminae, as well as the non-sensitive laminae, has projecting from its edge from 120 to 200 smaller secondary laminae or leaflets.

Lying within and forming a base or support for the sensitive tissue of the foot, we find the three bones forming the foot joint—the pedal bone, resembling a small foot; the navicular bone, slender but very dense; and the os coronae partly within and partly above the hoof. The other structures associated with these bones in forming the core of the foot are the lateral cartilages and the plantar cushion. As the weight comes on to the foot, the pedal bone decends, the horny sole also slightly descends and comes nearer to the ground. This is one reason why the sole is concave instead of flat.

Attached to the heel of each bone is a plate of cartilage forming an elastic wall to the sensitive foot and affording attachment to the sensitive laminae. They may be felt just within and extending above the hoof at its postero-lateral aspect. These cartilaginous plates constitute a very important part of the anti-concussion mechanism of the foot. When the foot expands at the heel, these cartilages carry outward the attached sensitive laminae, thus preventing any disturbances of the union of the sensitive and non-sensitive structures. Large venous trunks pass through and close to the lateral cartilages and the movement of these cartilages assist in the venous circulation of the foot. Side bones are simply cartilages which have turned to bone and when this ossification has taken place, the functions of the lateral cartilages are destroyed.

Between the lateral cartilage and just above the frog is located the plantar cushion. It is a fiber, fatty, rubber-like mass shaped like the frog and lies in the posterior part of the foot. Under the influence of the body weight, the frog is compressed and becomes wider, the plantar cushion with which it is closely in contact is also compressed and becomes wider. The effect of this increase in width is that the frog presses on the bars while the plantar cushion presses on the lateral cartilages, both of which, yielding laterally, force apart the walls at the heels. When the weight is taken off the foot, the heel returns to its original position. While the increase in width which the foot undergoes is comparatively small, it still makes all the difference between a yielding and an unyielding block of horn being brought to the ground, it "gives" instead of offering resistance and it is this "give" which assists in destroying concussion.

The entire weight of the body is supported by the union of the non-sensitive horny laminae of the inner surface of the wall and the sensitive laminae covering the pedal bone and lateral cartilages, so the weight borne by each foot is carried on 500 or more primary laminae and 72,000 or more secondary laminae. One-half this attachment is over cartilaginous and one-half over bony structures. The portions attached to cartilaginous structures are situated just where elasticity is required; namely, at the posterior part of the wall, thus one function of the lateral cartilage is to afford a movable wall attachment to the sensitive laminae and enable them to be carried outward during expansion. This explains the cause of lameness when side bones have developed and can no longer perform this function.

It is very interesting to note that while the foot presents a small circumference, in reality it enclosed a vast supporting area, due to the ana-

tomical arrangement of the laminae. By this folding the supporting surface of the foot is considerably increased, yet kept within reasonable limits. The bearing surface of an average sized foot is about eight square feet, giving a horse a total bearing surface or foundation of thirty-two square feet. The weight carried on each fore foot while the horse is standing squarely on all four feet is somewhat more than one-fourth the body weight; during locomotion it varies from half the weight of the body during certain stages of the trot to the whole body weight during certain stages of the gallop. Therefore, the study of the physiology of the foot resolves itself into a consideration of two principal functions—weight supporting and anti-concussion. The weight supporting structures are the wall and the bars, while the anti-concussion mechanism may be summarized as follows: First, the yielding articulation of the pedal joint within the hoof; second, the increase in width of the foot at the moment of impact when the heels come to the ground known as expansion, made possible by the flexible, elastic lateral cartilages, the bars, and the thinness of the wall at the heel; third, the elastic pads—frog and plantar cushion; fourth, the slight descent of the pedal bone and with it the sole; fifth, the slight compression of the wall from top to bottom.

If the foot is of the proper conformation, then these parts which form the anti-concussion mechanism serve their purpose best and the foot will generally stand the ordinary wear and tear incident to hard work. If the foot is not of such conformation as to allow these parts to perform their functions freely and properly, all kinds of trouble and diseases result. To give an exact description of a foot having the proper conformation, would be impossible, but in general, the front feet should be large, well proportioned and almost round, and the outer aspect being a trifle more rounding than the inner. It should be as wide as long on the ground surface, and the toe from two to two and one-fourth times as long as the heel. The anterior portion of the hoof should have a slope of 45 to 50 degrees, while at the heel the hoof should be almost vertical. The hoof head should be large and strong, but not open and coarse. The sole should be arched and the frog large, full, and in contact with the ground. The heels should be wide apart, equal in size and of the same height. The hoof should be tough, waxy and black rather than hard, brittle and shelly.

In the hind foot we look for practically the same things except that it is a trifle longer than wide and a trifle more straight, having a slope of from 50 to 55 degrees.

Some natural defects of the foot that should be avoided are:

Feet that are small, narrow, unequal in size or that are flat and spreading.

Feet that are crooked, pigeon toed, coon footed, or that have high, low, or sloping heels.

Feet that are cylindrical in form, that is, tending to be the same size from coronet to the ground.

Feet in which the horn is soft; also those in which it is hard, dry, brittle and shelly.

As volumes have been written upon the diseases of horses' feet, I can only call your attention at this time to the more common of these diseases with the hope that you will give them due consideration and study at some future time. Every live stock owner should have in his library a good, reliable book upon the diseases of live stock. He should study this book carefully that he may render intelligent first aid to the injured, and, if necessary, be able to treat the more common diseases and injuries of live stock. But generally the cheapest and safest plan is to call a competent graduate veterinarian if one is available.

(Continued on page 9.)

Holiday Dullness Delayed

Horse Market Trading Holds Up Well Here, Small Supplies Having More Effect Than Demand Changes. Butcher Cattle Higher. Hogs Change But Little.

The trade guage in the horse and mule market has moved up and down in the past week, showing that the approach of the dull season is at hand. In years past from December to the middle or latter part of January is known as the dull season of the year. In that time comes Christmas, with its holidays, and the suspension of considerable outside work. Also many avenues of demand are closed on account of weather conditions. This year, however, nothing has developed to indicate that that season has begun, but dealers, as soon as demand shows uncertainty, or is somewhat spotted, they pronounce the symptoms as holiday dullness. In one day last week one Southern buyer took 106 mules, and a buyer from Guatamala, South America, took a car load of driving horses, shipping them south by way of New Orleans. Added to this inquiry was about normal up to the end of the week. Some of the other markets further north and to the east have reported slack demand, but their trade is dependent on sections whose temperatures fall below zero in the early winter and continue that way until early spring. Southern buying is good for this season of the year. Cotton prices last week made new high levels for the season, and trade activities in the South are large, especially among the spinning and weaving cities. Some Southern buyers who have filled orders for horses recently say that they anticipate little interruption in the horse and mule trade at any time this winter. The trading in heavy draft horses has been limited in volume rather by the small supply offered than from lack of demand. Country buyers say that farmers have sold about all their surplus good horses, and are reserving the good brood mares. Some farmers will have surplus horses to dispose of in the early spring, but at present most of their horse power is at work in corn fields and in poor shape for marketing. Late winter and early spring will find some fairly large supplies of good fat horses and mules available, but demand will be preparing for a rush of spring work.

As far as prices are concerned dealers say there has been no important change in the past week. The only variations have been weak to strong with more steady than any other way.

There has been some trade in plugs and offerings that were deficient in some particular, but most of them went to bargain hunters, in small lots. Such demand is always uncertain. Most of that supply is drawn from the city and consists of the worn out and decrepid classes. Sometimes fairly good bargains are picked up, but in most cases the money paid is generally a big loss. Such horses have to be rested and fed up.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$250@300
Drafters, fair to good	150@235
Chunks, good to choice	135@170
Chunks, fair to good.....	90@130
Expressers and light draft..	55@120
Plain workers	40@ 85
Southerners, good	125@145
Southerners, plain to fair...	60@120
Plugs.	20@ 55
Mules—	
13 to 14 hands.....	$ 75@120
14 to 15½ hands.....	110@150
15½ to 16 hands.....	140@185
16 to 16½ hands.....	180@265

LAMER'S
PERCHERON SALE

SALINA, KANSAS
Friday, Dec. 27, 1912

We will sell at Salina, Kansas, on Friday, December 27, 1912, fifty-seven (57) head of imported and home-grown Mares and Stallions, consisting of:

24 Mares (2 to 5 years old), in foal.
7 "Yearling" Mares.
12 "Suckling Colts."
10 Stallions (2 to 5 years old).
3 "Yearling" Stallions.
1 Imported Hackney Stallion.

This consignment of horses was very carefully selected by me during the past summer and I can say, without the least hesitancy, that they are as good, or better, a lot as will be offered at public auction this winter.

Our aged mares are all in foal by the best stallions in the country and I can assure you that I bought only the kind that would build up a reputation for myself and establish a foundation of a family of horses.

We also have 40 Percheron and Belgian stallions in the stables, from 2 to 5 years old, weighing from 1,700 to 2,100 pounds—that we are offering at private sale.

Date of Sale--Dec. 27, 1912

Write for Catalogue

P. S.: On the following day—Saturday, December 28, 1912—we will sell 100 head of grade Farm Mares and Mules.

C. W. LAMER & CO. Salina, Kans.

Unimportant Changes in Cattle Prices.

The past two weeks developed no important changes in cattle prices. The swing in prices was largely characteristic of the season and largely confined to fluctuations of 15 to 25 cents. The season for short fed cattle is in full swing at Eastern markets, though at river markets there is still a fairly large supply of grass fat steers coming. The open winter thus far has been favorable for holding cattle, and some remarkable gains have been reported from feed lots. The general position of the market Tuesday was weak, owing to the large supply of short fed cattle that arrived in Chicago Monday and Tuesday. Some prime finished steers will be available at the International Live Stock Show this week, and prices are expected to make new high record marks. No Christmas beeves have been offered

(Continued on page 13.)

STALLION LIEN LAW.

Horse breeders now (in every state having a stallion inspection law and where the legislature meets this year) have an opportunity to get a lien on the mare and colt for 18 months after the mare is bred. It is the duty of every horse breeder interested in this proposition to personally see the law makers in his county and talk this matter over with them and to explain to them the necessity of such a law for the benefit of the honest mare owners, as well as for the maintenance of better stallions and jacks. Those who are in favor of this law expect to pay their honest debts and those who oppose it will pay their debts if forced to. After this clause becomes a law competition will reduce the service fee to the honest mare owners and be a great benefit to them. This lien law has been in effect in the state of Utah for several years and has given good satisfaction.

States not having a stallion inspection law could not do better than to adopt the Arkansas Stallion Law, which is as follows:

The owner of any male animal, kept for the propagation of his species, shall have a lien upon any female animal and her offspring to which such male so let for the sum contracted therefor, which lien shall attach at the time of service of such male and shall not be lost by reason of any sale, exchange or removal from the county, or other disposition without consent of the person holding the lien, the same may be immediately enforced. Provided; also upon the sale, exchange, removal or disposition of such female animal without consent of person holding the lien or with intent to defraud him, the owner of such female animal shall be guilty of a misdemeanor and upon conviction thereof shall be fined in any sum not less than twenty-five dollars ($25), not more than fifty dollars ($50).

At any time within twenty months after his right of action accrues, the owner of such male animal may file with any justice of the peace in the county, a written statement, duly verified, setting forth amount of his claim, his cause of action, and a description of the animal upon which he has a lien, and the justice shall thereupon issue summons as in other cases and embody therein a description of the animal and an order to the constable to take the animal and her offspring, if there be an offspring, and hold to (her) or them subject to the order of the court.

If upon trial, judgment be rendered for the plaintiff, the court shall order a sale of the animal or animals as on execution sales to pay the judgment and cost, and if bond be given for the retention of the animal or animals the court shall render judgment on the bond against the sureties for the amount of the plaintiff's debt and cost.

Repealing Clause—All laws and parts of laws in conflict with this act, be and the same are hereby repealed.

Modern Horse Breeding

There are a lot of well to do horse breeders who could greatly improve their business by traveling a reasonable amount. Too many substantial stallion and jack owners are limited in experience. Instead of merely being familiar with the stock in his immediate vicinity, every breeder should find out what other breeders are doing. There is no better place for this than at the Scientific Breeding School, where a large body of men are together for a week. They usually all put up at the same hotel, where they can get acquainted and visit with each other while the school is not in session.

Many of them have stock to sell, while others wish to buy. Many sales are made at the Breeding School. These students form the acquaintance of each other remarkably quick—just like brothers—and they talk confidentially on many subjects that are not generally discussed. It is worth while to be with a body of men helping each other in their work and answering questions for one another.

In addition to their school, many places of interest are visited. During a recent term a large mail order house was inspected, which showed its appreciation by serving a complimentary dinner for the entire class. At many places which are visited special guides show the students everything of interest. By having a special guide and limiting the time many places can be visited, during recesses, that are of great interest to every farmer and breeder. Selling horses at auction at the stock yards interests all horse men. It is necessary for men used to active lives at home to have regular exercise between sessions of school, and all spare time is thus used to good advantage. An opinion students usually express, is that at a term of school they receive more experience than ever before during the same period of time. The school begins every morning at 7:30 promptly and closes at 10:30 at night. These students do not have an opportunity to spend much money while in Kansas City, as they do not have time.

Fathers and mothers need not be afraid to send their boys to this school, for they will go home in better condition than they came. They will be taught the right principles of living and have a good example set before them. Only two students out of nearly 800 who have attended, have ever entered the school room in an intoxicated condition, and these two men later made excellent records, and the writer believes that these two men have never touched liquor since. If every father and mother knew what was taught at this school they would send their boys. They are taught, in a very plain manner, the great danger of all the diseases know to young men. They are also taught that this life is not all a money consideration. The lessons that young men receive at this school will never be forgotten. They are taught that all substantial business propositions must be handled on the square.

Outside breeders do not realize the amount of correct teaching as well as valuable information received at the Graham Scientific Breeding School. If they could fully realize the importance of such instruction they would attend the school by the hundreds at every term. The great difficulty with horse breeders is that they receive a little information now and then, but it is not so arranged and condensed as to be effective. Where they are required to go through a complete course they reinforce their information; one step leads up to another so that when the term is over they feel that they have something worth while. Mr. Rockey from Idaho, who attended the last term of school, stated that it was the most complete course of instruction ever given on anything of this kind, and he has attended numerous institutions. This breeder does not even own a stallion; he came for the benefit of his business as an owner of mares.

If this institution can be made permanent, so that each school would contain from 100 to 200 students, and be made profitable, it is the greatest thing that horse breeders have ever had an opportunity to attend. One lecture on infection is more than worth the tuition, but there are hundreds of things that are explained in a plain manner that every horse breeder should thoroughly understand. All of the instructors except two are instructors in veterinary institutions recognized by the government. The dissecting of mares is probably the most interesting thing for the students. The reason it is interesting is because the instructors give the students what they could not possibly get in any other way concerning the form, relation and importance of the parts shown.

The lantern slides used in teaching types and breeds of animals are the most complete set in the country. All of the different market types are thoroughly discussed, as well as the good qualities and the defects in the different breeds of horses, jacks and mules. A lot of breeders are going astray themselves and leading their communities astray by not knowing what constitutes a good individual. A lot of breeders are not familiar with unsoundnesses found in their stock. All this is thoroughly explained. The pictures are thrown on the curtain in life size so that the students can get a correct idea in all cases. The live horses and mules are judged at the horse market, the mule market, and the packing houses, where some of the best are found.

The next term will be held December 16 to 21, inclusive, making six days and nights of illustrated lectures and demonstrations for horse breeders. Unless that term of school is well attended it will be the last term for one year. We hope the breeders will realize what this means and encourage attendance at the next term so that other terms can be held.

The tuition fee is $25 for a life membership. Any breeder can attend this school and if not absolutely satisfied in every respect, the tuition fee will be refunded, and he alone is to be the judge. This is certainly a fair offer and we can not realize how breeders can afford to miss this great opportunity. We say opportunity because it is the greatest opportunity ever offered to horse breeders. Any breeder can afford to cross this continent to come if he expects to remain in the horse breeding business, and many already have come from states as distant as Pennsylvania, New Mexico and Idaho, and some from more distant states and foreign countries.

Nearly every breeder is of the opinion that he could not attend a breeding school for the want of time. This is only imagination. Every horse breeder should be able to get away from home at least one week during the year. If every breeder should wait until he did not have anything to do he never would go anywhere. There is only one way to arrange a matter of this kind and that is to get ready and go when such an important proposition is at stake.

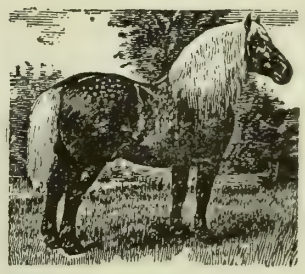
Students from nearly every part of the United States have attended this school. Nearly every one of them has been well satisfied, there having been a very small per cent of failures. One breeder who was here recently for his second or third term said that one great difficulty is with the students. "When a student attends this school,"

(Continued on Page 14.)

31 PERCHERONS

Must Be Sold at Once

We have sold our farm, and must give possession January 1st, 1913. This makes it necessary that we should sell our Percherons, the result of many years of intelligent breeding.



We are offering for quick sale, 18 Brood Mares; 12 Stallions, coming three years; and one Stallion coming four years. These Mares are among the best in America. The Stallions are mostly the get of Alban 46137 (64433).

Come and see these Grand Percherons, or write for list.

PATTERSON-ERICKSON CO.

Worthington, Nobles County, Minnesota

Wolf Bros. Big Boned Imported Percherons and Belgians

We landed September 1st with a great lot of Percheron and Belgian stallions and mares. We showed at the great Nebraska State Fair September 5th and won the following prizes:

Two champions, one reserve champion, eight first prizes, seven seconds, one third and three fourth—twenty-two ribbons in all.

THESE PRIZE WINNERS ARE ALL AT OUR BARNS AND FOR SALE AT VERY REASONABLE PRICES.

If you are figuring on buying a first-class stallion or a pair of imported mares and want to see the best horses, you cannot afford to miss the opportunity to see ours. Special low prices made for the next 60 days. Address, for all information

Wolf Brothers

Albion, Boone County, Nebraska

IMPORTED STALLIONS

PERCHERON
SHIRE BELGIAN

Each year we show our New Importation the same month they land; each year they win more than all other exhibitors combined. At the American Royal this year we won 2nd on 4-year-old Percheron, 1st, 3rd and 4th on 3-year-old; 1st and 3rd on 2-year-old and 1st and champion on group of five stallions. All are for sale. Our guarantee and insurance are the best. Our horses the best.

PERCHERON IMPORTING CO. CHAS. R. KIRK SOUTH ST. JOSEPH, MO.

TWO DAYS DISPERSION SALE OF PURE BRED PERCHERONS

January 2d, sale at Lexington, Ill., F. W. Schwab sells 16 head consisting of 14 mares and fillies, and 2 stallion colts.

January 3d, sale at Pontiac, Ill., W. H. Welch sells 30 head, consisting of 23 mares and fillies, and 7 stallions from weanlings to 6 years old.

In both lots are some good mares bred to Apollon 26130 (42491), the great son of old Besique (19602); also some weanlings and yearlings by the same sire. Address for catalogues ready December 15,

FRED W. SCHWAB, Lexington, Ill., and W. H. WELCH, Lexington, Ill.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED,
225 WEST TWELFTH STREET,
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Chicago Representative,
JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates.
1 inch: 1 month, $5.00; 1 time, $2.80.
½ inch: 1 month, $2.80; 1 time, $2.00.
Rates for longer time or larger space furnished on application.

Subscription price, $1 per year or $2 for three years, payable in advance.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

Copyright, 1912, by the Graham Publishing Co.
All persons are warned not to reprint any part of this paper without giving full credit for the same to the American Breeder, Kansas City, Mo.

RENEW YOUR SUBSCRIPTION NOW.

A year ago we changed the American Breeder from a monthly to a twice monthly issue. We doubled the cost of printing, and of paper, and doubled our editorial work. But we made no change at the time in our subscription price, for the reason that a large majority of our old subscribers—old and tried friends of this paper and the best support that any paper could have—were soon to renew. Their subscriptions largely expired in December and January. We wanted them to have the paper another year (or three more years—as many of them chose) at the old rate. And so, to be equally fair to all those whose subscriptions expired in later months, we continued our old rate for an entire year.

Now, for a year, we have doubled our service and soon we will increase the size of the paper as well as its efficiency for its readers. No one will wish us to continue selling two papers per month at the price of one, and so we announce that all subscriptions from this date on are $1.00 per year or three years for $2.00, payable in advance. The paper always stops at the expiration of the paid up time. We hope as many readers as can, will pay for three years in advance. This will save all the trouble each spring of having to renew, and (as many readers do) of putting off until the paper has stopped, and valuable issues lost unless back numbers are secured. Every reader can well afford to renew his subscription for three years. Those who do this are not liable to miss any issues during the spring months, when the paper is most appreciated. Most of the subscriptions expire in December and January. The big rush is in January. If all would renew now, they would not miss a single issue. It requires much extra help to care for the thousands of renewals as well as the new subscriptions, during the rush. The proper thing to do is to send in your renewal now for three years in advance. Look on the wrapper of this issue and see when your subscription expires, if it is 1-13 that means the first of January, 1913; if it is 2-13 that means the first of February, 1913, but in either case, if you send $2.00 now your subscription will be extended three years beyond the date now shown on your wrapper.

LIVE STOCK DISEASES.

It is impossible for all those interested in live stock to be expert veterinarians. There are so many different diseases that it is impossible for the average breeder or farmer to know the symptoms in all cases. It is not our intention to make veterinarians out of our readers, but a lot of live stock is sacrificed each year because the owners do not know when to get a qualified veterinarian. A lot more of our best live stock is sacrificed because the average breeder does not know what the ailments are, consequently these animals are destroyed through ignorance. More live stock is destroyed each year through the use of strong drugs in the hands of the inexperienced, than are benefited .

The veterinarian who is interested in the improvement of live stock is glad to have the breeders posted along these lines, for it is this class that is familiar with the necessity of employing men of experience to accurately diagnose and treat its stock. These individuals realize that great progress has been made during the last quarter of a century, and that if the veterinarian is called in time there is often little need of losing animals, which would otherwise die. It is usually the delay which causes death of animals.

We wish to inform our readers of these subjects so that they may know when it is necessary to send for a veterinarian. Every breeder should have the telephone number of his veterinarian in his book so that connection could be made quickly and no time lost. There are many individuals who are treating live stock for others that would quit the business or attend a qualified school if they were better posted. If many of these individuals could attend a few operations at a recognized veterinary college they would realize how helpless they are in serious cases. In order to progress as a nation it is the duty of every good citizen to encourage education in this as in other lines.

On numerous occasions the writer, in company with a large number of prominent breeders, has visited at one of the most up-to-date veterinary colleges in the world, where delicate operations were performed. Some of the breeders had been treating live stock for their neighbors, but after seeing these clinics they decided to recommend qualified men and attend more strictly to their breeding business. They have learned the danger of infection, which is one of the difficult things for the average breeder to understand. Infection means much to the veterinary profession; anything that will enlighten breeders and farmers on this one thing, if nothing more, will be welcomed by the qualified veterinarian. No one in a community is in a better position to enlighten the farmers on this (as well as many other subjects), than stallion and jack owners. They have an opportunity to talk to the leading breeders in most vicinities; they usually have plenty of time for this, and if they are well versed on this subject they can be of much assistance.

It is our intention to take up a disease, giving the symptoms and a method of diagnosing certain conditions of the more prominent diseases, and print photographs of the germs that cause such diseases. Most of the disases are caused by known organisms that can be carried from one animal to another, and if such organisms could not gain access to an animal the animal would not have that particular disease.

We hope our readers will make a special study of these diseases, not only for the class of live stock they handle, but of all other classes. Nearly every disease caused by a particular organism has its peculiarities, and all breeders of live stock should study these things carefully.

These articles will be prepared especially for our readers in a condensed, understandable form and should not be overlooked.

HOW TO ADVERTISE.

One of the important things for breeders of live stock to understand is advertising. It is difficult to prepare a specific method of advertising to fit each individual case, but one of the important things is to incorporate in an advertisement some particular thing that will attract attention. For instance, many stallion advertisers who have had a stallion for several years frequently fail to say "colts to show." A great many men in the market for a good stallion will not buy a second hand horse without having this opportunity. A breeder may have excellent stock, but if he can not attract the attention of buyers he can not sell them to good advantage.

Salesmanship is one of the weakest points in live stock breeding. Nearly every breeder or user of breeding stock has stock for sale at some time. A good jack is about the only exception, as they do not have to be changed every four years, as in the case of stallions or other sires. It is a settled fact that only those who understand advertising remain in the breeding business, and the better this is understood the more results the breeder gets.

By properly advertising the stock can be sold at the proper time. After stock is developed and the owner is not in position to use it, he must sell it at some price, regardless of its cost. Every breeder should read the advertisements of those disposing of stock; see what peculiarities there are in the advertisement; see what the drawing card is; note the size of one advertisement that has been successful and compare the amount of space used and see if it is profitable to use the extra space. Frequently breeders try to get too much reading matter in a very small space.

It must be remembered that somewhere there is an individual just as anxious to buy what you have to offer as you are to sell. Can the average breeder find the connecting link? There must be something in the advertisement to encourage the prospective purchaser to answer an advertisement. After the first letter is received a complete description must be the answer, setting forth a reason for the sale and the good qualities of the animal and such other things that would interest the prospective buyer in a special case. If the prospective buyer is not interested after receiving the first communication, the advertiser should prepare another letter. Because the prospective purchaser was interested enough to answer that particular advertisement, is evidence that he is a prospective buyer. Many breeders fail to make their case plain in answering inquiries. Frequently a second or third letter will get the desired results. One of the strongest points in answering inquiries is to give a complete description of the animal just as it is and state in the letter that you will pay the car fare and expenses if the animal is not just as described.

A little study along this line will greatly enlighten the average breeder who has stock for sale. A careful study of the advertisements in this paper as they appear from time to time offers a good opportunity. After all the advertisements have been read over carefully try to select the one that is prepared the best; one that reaching live stock breeders would be most likely to cause those interested to write the first letter as an inquiry. This does not apply to large breeders but to those who have only a stallion or a jack to sell or stand to public service, or a cow or a hog to be offered.

Salesmanship is a wonderful thing and requires a considerable study. After the breeder has studied the advertising sufficiently he must then select a publication that is read closely by the particular class of people he wishes to reach. That publication must not carry advertising for a lot of crooks if results are expected. All business is done largely through confidence. If the reader does not have the confidence of a publication they are not going to answer the advertisers very extensively. There are a lot of breeders who have surplus animals for sale that are decreasing in value every day and should be sold. There never was a better time to begin than right now. A few dollars spent in advertising frequently puts the breeder in a position to dispose of the non-producing stuff and invest it in young stock to an excellent advantage.

AN INDEPENDENT PAPER.

The editor who conducts a fearless, independent publication frequently receives some very peculiar communications. Many of these are not signed; occasionally one is full of surprises at some particular stand we have taken. We want it distinctly understood that this paper is an independent publication. It is not owned or controlled by any breed, faction or element. The editor is always glad to receive advice or enlightenment on any subjects, but reserves the right to express his own opinion at his pleasure.

All the campaigns the American Breeder has ever taken up has been new to the world; no one except the editor knew what was going to happen. The breeders want a publication that stands for honesty and a square deal of a free and independent nature. This is exactly what we are trying to give our readers. There are always two sides to every question. They should both be considered carefully before taking action, otherwise much serious injury very easily could be done. No honest man need be afraid of the American Breeder.

STALLION OWNERS.

A considerable service can be done in a community by the stallion and jack owners in the way of helping to dispose of the colts. In nearly every community there are a few buyers who try to get the colts very cheap. The first few sales in a community frequently regulates the value of other colts. If some one interested can use the telephone or visit these men on the streets or at public sales, these prices can usually be regulated satisfactorily. Nearly any kind of a good colt should be worth $100 at weaning time, and many of them have sold out of grade mares for $150. The higher the price the more stimulated the breeders will be in that community.

Stallion and jack owners could not spend a few days to a better advantage than interesting prospective buyers who will pay a good price. All record prices should be remembered, even if the prices are a little higher than the general market offers. There is probably no other stock that will make a better profit than good colts bought and developed where feed is reasonable. It is not a wise policy on the part of farmers to dispose of their colts, as a rule, but they should be encouraged to fully develop them and see that they have plenty of feed, water, fresh air and exercise of the right kind. If stallion and jack owners would pay more attention to this feature of their customers' business they could greatly increase their own business.

It is also a good plan to inquire about the mares; whether they are in foal or not and what condition they are in. It is only human nature for

Important Announcement

For December Term (Dec. 16 to 21) of the

GRAHAM SCIENTIFIC BREEDING SCHOOL

The Term Announced Above for December is the Regular "Before the Holidays" Session of School. An Article Elsewhere Deals With Important New Information Concerning This Term.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. The instructors, of whom there are ten, include horse experts from the leading agricultural and veterinary colleges, who know the needs of stallioners.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block east. Tuition is $25, which entitles all students to a free return privilege for life. For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL

225 West Twelfth St., Kansas City, Mo.

those to respect the individual who takes an interest in their general welfare. During these inspection trips is an excellent time to find the missing colts that have not been paid for. These mare owners that have been assisted are in duty bound to help the stallion and jack owners in the collection of service fees. This is also an excellent time to get a complete list of names and addresses of every mare owner in that section of the country. This will come very convenient for advertising a little later on.

The most important feature of this work will be to work a little politics; get the men interested with you that own good mares and pay their honest debts, to help work for the stallion lien law in your state. Convert a few of these men and show them where it will be to their advantage; have them see the law makers in your county. A few of these men who do not own stallions should have much weight, and by all means have your stallion owners in your county visit the law makers also. This campaign should be started immediately. A few good, live horse breeders in a community can get the desired results. If the law makers find that these men are interested and going to know just how they vote on this particular issue, they will be very careful what they do. A dozen or two good, live men in a community can change a very large number of votes for an individual or two if they want to, and this is the opportune time to get busy and make this feature plain. If the stallion and jack owners will unite and work together they can put the breeding business on a better basis from a profit standpoint, both for themselves, and the best people among their customers.

COURSE FOR THE HIRED MAN.

The hired man from the farm who spends his summer earnings during the winter in town will find a special program arranged for his benefit this winter at the Kansas Agricultural College. It is a program arranged at the state's expense. It will cost the hired man or the farmer's son or anyone else, for that matter, about $3 in fees, to take the winter short course, the hurry-up instruction in agriculture arranged especially for men, young and old, who find it impossible to go to college for the regular term of four years.

This short course will begin January 7 and end March 19. It will be ten weeks of condensed, practicable and practical instruction, a fine foundation for a first class farmer's education. Instead of spending $50 or $75 in idleness, many a hired man, or tenant, might get, with his money, the knowledge he needs to make him a land owner. The program thus far arranged for the short course includes: Crop production, live stock feeding, live stock market classes, stock judging, animal breeding, poultry work, wood work and other manual training, dairy farming, and dairy manufactures, creamery management, butter making, cheese and ice cream making, judging dairy products, orchard and garden work, how to plant trees, grain judging, farm mechanics, crop judging and farm management. Dean Miller of the extension division is already receiving applications from intending students.

INTERNATIONAL LIVE STOCK SHOW BULLETIN

The showing of Belgian draft horses was the largest of this breed ever made in the United States.

The exhibit of Shorthorn steers was the best in the history of the International.

In the first three rings of Percherons shown, W. S. Corsa won two firsts, two seconds, one fifth and two sevenths, all on colts by Carnot.

The fat barrow grand championships, both for single animals and for pens of three, were won by pure bred Poland Chinas shown by John Francis & Sons. Five other breeds, and a class for grades and crossbreds were against them.

At the annual stockholders' meeting of the Percheron Society of America the four directors whose terms expire this year were re-elected. The re-elected directors are Corsa of Illinois, Nave of Indiana, North of Nebraska and Lee of Kansas.

Fat steer championships were won as follows: Shorthorn, J. F. Prather, on Prime Knight, a calf; Herefords, J. H. & J. L. VanNatta, on Diamond's Perfection, a two-year-old; Angus, Kansas Agricultural College, on Insurgent Envoy, a two-year-old; Grades and Crossbreds, J. D. McGregor, on Glencarnock Victor, a high-grade Angus. The last named steer also won the grand championship for all classes.

First prizes for Belgians were awarded on the opening day of the show as follows: Aged stallions, J. Crouch & Son, on Mon Gros; three-year-olds, Loeser Bros., on Frank Bolser; two-year-olds, Bell Bros., on Cyclon; aged mares, Crouch & Son, on Elza; three-year-olds, Bell Bros., on Sara de Dottigduies; two-year-olds, Crouch on Mizette. Crouch & Son also won all of the seconds and half the thirds in these same rings.

Student teams from 12 agricultural colleges were entered in the judging contest. Following is the order in which the contesting teams were rated, by the committee which passed on their work: Iowa, Kansas, Missouri, Ohio, Nebraska, Ontario (Canada), Texas, Kentucky, Manitoba (Canada), Arkansas, Nevada, Pennsylvania.

NEW VOLUME BELGIAN STUD BOOK.

To the American Breeder:—We are now publishing the fifth volume of our Stud Book and hope to have it ready for delivery the first of the coming year. By authority of our association, each member is given permission to have printed in said volume a cut of a Belgian horse or mare or group of Belgians, with his name and address under same. The cut must be a suitable, first class halftone—133 line screen—not to exceed in size 4 inches by 6½ inches and with no printing on cut, except name and American number of horse and the name of the owner and address. I prefer to have no printing on cut. We are publishing the handsomest Stud Book in the United States and one that is a credit to the interest of our horses, and nothing has added so much to its value and popularity as the fine cuts that have appeared in Volumes II, III and IV, and it is hoped that the coming fifth volume will be the handsomest of all.—J. D. Conner, Jr., Secretary Belgian Stud Book, Wabash, Ind.

Don't over feed and give your swine plenty of exercise if you want them to be rid of thumps.

DRAFT HORSES

WANT TO QUIT BUSINESS.

Two Percheron stallions for sale; one dark chestnut 8 years old, weight 1800 pounds; on dark gray, 3 years old, weight 1700 pounds. Also my big black jack with white points, 7 years old, weight 1100 pounds, 15½ hands standard measure.

All sure breeders; colts to show. Would exchange for draft horses, mules or cattle.—**G. W. Newman, Elvaston, Hancock County, Ill.**

Pioneer Stock Farm

We have on hand at all times Percherons, Belgians, Shires and German Coach stallions and mares; imported and home bred stallions and mares weighing up to a ton or better. They are priced to sell; am selling all the time. Can show if you will only come and see. **John W. Waddill, Brashear, Adair County, Mo.**

TWO BIG BLACK IMPORTED PERCHERON STALLIONS.

Ages 5 and 7 years; weight in ordinary condition 2,000 and 2,050 pounds; big, fine, good style and action and sure foal getters; plenty of colts to show. Or would exchange one for a big young jack. Reason for selling, have adopted the Capsule System of breeding and have them to spare. **Henry Goertzen, Henderson, York Co., Neb.**

STALLIONS FOR SALE.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Am offering these stallions because I have adopted the capsule system and have them to spare. **Henry Dreher, Cedar Rapids, Boone County, Neb.**

FOR SALE 300

200 Percheron stallions;

100 Percheron mares;

all ages and prices (50 herd headers.)

Singmaster & Sons, Keota, Keokuk County, Ia.

IMPORTED STALLIONS. BELGIANS AND PERCHERONS.

Have just arrived from Belgium and France with new importation of Belgian and Percheron stallions which I would like for you to inspect before buying elsewhere. Barn in town. **C. W. Babcock, Walford, Benton County, Ia.** Walford is 4 miles southwest of Fairfax on C. M. & St. P. R. R.

IMPORTERS OF PERCHERON HORSES

and dealers in American bred draft horses and standard bred horses and high class jacks. Will sell at right kind of prices and terms to suit purchaser. Give us a look before buying elsewhere. **Fisher & Walker, Evansville, Vanderburg County, Indiana.**

150 STALLIONS.

Home bred draft stallions, $250 to $650. Guarantee to sell you imported stallions for less money than any firm in America. Come to a live stallion market and see all draft breeds. **A. Latimer Wilson, Creston, Iowa.**

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

IMPORTED AND HOME BRED STALLIONS.

I will sell imported stallions, $800 to $1,000, except two stallions. Home bred stallions, $300 to $600. Come and see my horses. **Frank L. Stream, Creston, Iowa.**

20 REGISTERED PERCHERON

stallions and mares for sale; might exchange for other stock. **J. D. Putman, Saline, Mercer Co., Mo.**

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding; feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

ENLARGEMENT UNDER JAW—What is the trouble with a four year old mare, also a yearling filly, I have? They have very hard lumps under side of lower jaws. No soreness and teeth seem to be sound. I have been told that it may be ulcerated roots. The enlargements are hard as the jaw bone and no sign of pus or smell of unsound teeth. Would it do any good to pull the teeth. Thanking you in advance.—Nebraska Subscriber.

REPLY—So long as the enlargements cause no more trouble than they appear to at present we would suggest that they be left alone. In the event the teeth are diseased it will show up in time, at which period it will be soon enough to act.

AMANROSIS—I have a mare four years old that went blind sixty days ago. Her eye looks natural, but the pupil is enlarged.—Utah Subscriber.

REPLY—It is quite likely that your mare has lost her eyesight as a result of paralysis of the optic nerve, in which event there is no cure for her.

POSSIBLE TUMOR—I have a two year old mare, in good flesh and apparently all right, but when she lies down there appears a bunch that turns out of her about the size of your fist. It is the natural color and looks healthy. When she gets up it goes back again. I have heard of their casting their weathers, but this does not look like that. She is large behind and looks like a mare that is in heat, otherwise she looks all right. She has a sister that is one year old and is the same way. This is not a very good description, but I do not know how to describe it any other way. What is the cause and what can be done for them?—South Dakota Subscriber.

REPLY—It may be that your mare experiences only a partial eversion of the vagina, but she should be carefully examined for the presence of a tumor. We would advise that you take her to some one whom you think competent to make such examination in the event you do not care to undertake it yourself.

FISTULA—Will you give me a remedy for a fistula that has broken? I am a new reader of your paper and like it very much as I like to look at and read of fine stock. Success to the American Breeder.—Texas Subscriber.

REPLY—We presume you refer to a case of fistulous withers. As a rule these cases, like nearly all abscesses, need some surgical attention before they are ready to heal, and we fear it would only be an aggravation and loss of time to you to merely prescribe something in the way of medicine without the necessary surgical attention.

You should take this animal to a qualified veterinary and have proper drainage made and when this is done the healing up process becomes a simple matter.

BAD WIRE CUT—Will you please publish a cure for a bad wire cut foot? The foot was cut on both sides just above the hoof, early last spring. It has a ring above the hoof as large as my arm and is raw. The mare is not lame, but does not handle it very good. I will be glad just to heal it, for next year in fly time she will keep it sore. I tried cutting some of the bunch off, but it comes on again. Could I burn it with caustic so it would stay down, and then heal it over? I have tried all kinds of dopes.—South Dakota Subscriber.

REPLY—We fear that this wound has already been too much treated and has reached a point where in

Trumans' Champion Stud

Our second Importation this fall

Left LONDON on MINNEWASKA Oct. 19. J. H. TRUMAN says they are the GRANDEST LOT of SHIRE HORSES that ever crossed the ATLANTIC OCEAN,

Our August Importation

Consisting of the most Sensational Shire, Percheron and Belgian Stallions imported this year, are now in first-class condition, and all for sale. The coming season is our 35th anniversary in the importing business, and during that period the name "TRUMAN" has stood for all that is straightforward and honorable, and we have not found it necessary to change our mode of doing business or our guarantee, which, as usual, is most liberal and good as gold. Imported Shire and Percheron mares of outstanding individuality for sale.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us. At the great Bushnell Horse Show the champion Shire stallion and mare, champion Percheron stallion and mare and champion Belgian stallion were imported by us.

PERCHERONS AND JACKS

for sale. "Don" 72956; black Percheron; foaled 1909; a sure breeder of fancy colts; easy to handle; broken and used every day in farm work; weighs 1,700 pounds in working order. Price $800.

"Coco" (84587); black Percheron horse colt; foaled 1911. $500. These animals have never been pampered or unduly forced. Both are rich in brilliant blood.

"Dan Taylor, Jr." 3194; jack; black with white points; 15 hands; very large boned; fancy head and ears; sure foal getter of dandy mules; quick worker. $1,000.

Will take registered mares or fillies in trade for any of above stock. We have a surplus of stallions and jacks. **Borden Stock Farm, Tonti, Marion County, Ill.**

FOR SALE.

Belgian stallion; 7 years; weight 2,200; won a gold medal in Belgium; has 14 firsts and sweepstakes. I think this is the best horse in Missouri. One dapple gray Percheron; 4 years; weight 1,760. Will consider a good jack for him. One Percheron colt; 7 months old; weight 960. One Belgian colt; 6 months old; weight 920. This is extra good stock. Will price to sell. **Wm. Hartman, Baring, Knox County, Mo.**

GRADE BELGIAN STALLION

for sale. Six years old; weight 1,900 pounds; South Dakota certificate of soundness; good breeder. Never bred him in one season to over 45 mares; gets greater per cent of mares in foal; have few mares come back. **Joseph Maresh, Kimball, So. Dak. Rte. 1, Box 34.**

REGISTERED DRAFT STALLIONS AND MARES

for sale; mostly Percherons. Also road stallions, mares and colts at prices to suit your pocketbook and full value; can furnish most anything you want. **E. P. Hamilton & Sons, Garden Grove, Decatur County, Iowa. R. F. D. No. 2.** We are 23 miles southwest of Chariton and 24 miles southeast of Osceola. (Station, Leroy).

STALLIONS FOR SALE.

Imported black; four years; registered P. S. A.; $750. Home-bred; four years; dapple gray; registered P. S. A.; $500. Black; two years; good size; registered P. S. A.; $400. Bay, French draft; six years; registered; extra large; $400. Jaak colt; large; $250. All sound and large; cash only. **E. R. Smith, Fairfield, Jefferson County, Iowa.**

TWO YOUNG PERCHERONS

Remarkably good big home grown stallions. extra bone. Registered. One gray coming three; one black coming four. State certificates of soundness. South Central Iowa; good railroads. Anxious to sell. **Fred Chandler, R. No. 7, Chariton, Iowa.**

IMPORTED TON BELGIAN STALLION

for sale; six years old; gets 80 per cent of his mares in foal; imported by J. Crouch & Son, Lafayette, Ind.

Also two first class jacks; 2 and 8 years old; 15 hands high; sure foal getters; quick to act. Will sell cheap for cash. Leaving state is my object for selling. **W. T. Rodecker, Mulberry Grove, Bond County, Ill.**

BIG PERCHERON MARES

for sale. 3 to 7 years old; 1,700 to a ton in weight. Some matched pairs.

Also a black 1,900 pound two-year-old stallion, a 1,500 pound yearling, and stallion and filly colts. **J. W. Barnhart, Butler, Bates County, Mo.**

FOR SALE AT $300 LESS

than their real value; 5 year old gray French draft stallion 19657; 8 year old imported black Percheron stallion (63309) 50853; sound and gentle. **J. E. Lewis, Stewartsville, DeKalb County, Mo.**

REGISTERED PERCHERON STALLION

8 years old; black, star; weight 1,800; sound. Would take a good mare in exchange. **B. B. McEndarfer, Waterloo, DeKalb County, Ind.**

FOR TRADE.

Imported Shire stallion; registered, big and sure. Price $900. Want clear cheap land; good title; even trade. **E. R. Smith, Fairfield, Jefferson County, Iowa.**

TEN GOOD STALLIONS

Registered draft, for sale to close partnership. **C. C. Walker, Keota, Keokuk County, Iowa.**

IMPORTED PERCHERON STALLION

For sale; 8 years old; a good breeder, with colts to show. Will sell very cheap if sold soon. F. R. HOWARD, Anita, Cass County, Iowa.

order to make a satisfactory cure should be operated on with a view of removing this great mass of exuberent granulation. Take her to a good, competent surgeon and get started right in the matter and by so doing secure healing before the advent of warm weather and flies.

STIFF MULE—I have a six year old mule that is stiff in both front and hind quarters on the right side. Drags both feet when walking. Eats good and drinks well. When I first noticed him failing he could neither get up nor down.—Illinois Subscriber.

REPLY—Your inquiry is not sufficiently definite to enable us to make a satisfactory diagnosis and we would suggest that you have the animal examined by a competent veterinarian.

TUMORS—On examining a mare's vagina lumps can be felt beneath the bed or bottom of vagina similar to the testicle of a yearling colt. They do not protrude in the vagina, but on pressing lightly around the bottom of vagina these lumps can be felt. Is this a normal condition or tumors, and would they be likely to prevent a mare from breeding?—Colorado Subscriber.

REPLY—It is more than likely that the bodies that may be felt are tumors growing in the walls of the vagina. As a rule such growths are of a benign character, yet they influence against fecundation and some mares afflicted with them do not breed. They exert a greater influence in this direction when related with the uterus itself.

STUDY OF THE HORSE'S FOOT.

(Continued from page 4.)

The seriousness of thrush, quittor, and nail puncture is due to infection and in treating these diseases the aim is to destroy the infection and prompt nutrition of the parts involved. Immediate treatment lessens the severity of these diseases and increases the chance of recovery.

Corns, sole bruises, quarter cracks, and contracted heels result seriously if neglected. The first thing to do is to remove the cause and then see that they are properly treated and cared for.

Founder is most common in badly formed, flat and pointed feet, and is caused by a variety of conditions, such as errors of diet, chills, continued standing without exercise, and it often occurs as a complication of colic, influenza and parturition. Prevention is a great deal more economical and satisfactory than treatment, but if a case develops in spite of preventive measures, the important thing is that if proper treatment is begun within the first 24 hours, recovery is generally complete. The longer treatment is delayed, the less becomes the chance of recovery.

The diseases of the feet which are probably of most interest to the breeder are those which are generally considered to show a hereditary predisposition to develop in the offspring of animals having these troubles. To be on the safe side, we should include in this list navicular disease, ringbones and sidebones.

Navicular disease occurs most frequently in light horses, especially those having narrow feet, short hoofs, and short, upright pasterns. The immediate cause is due to the excessive strain and jar to the perforans tendon and navicular bone, due to the faults of conformation just mentioned. Because these peculiarities of conformation are practically always associated with navicular disease, it should be looked upon as a disease showing a strong hereditary tendency to develop in the offspring. Some authorities claim a direct hereditary tendency to navicular disease aside from defects of conformation.

While ringbones are not a condition involving the foot strictly speaking, they are so closely associated with the foot that they will be considered at this time. They are bony growths in the region of the coronary joint with which nature is trying to brace up a weak joint. They are most common in horses having long, weak pasterns which result in greater strain

TAYLOR & JONES

Williamsville, Sangamon Co., Ill.

Our new horses are now in the barns, and we have an extra good lot of Belgians, Percherons and Shires. We invite buyers to call and look them over. We buy the best we can buy, and if there were any better to be found we would handle them. Our guarantee is safe, and we can protect a buyer from loss for the full purchase price. Come and see us. It won't take long or cost much, and we feel sure we can save you some money.

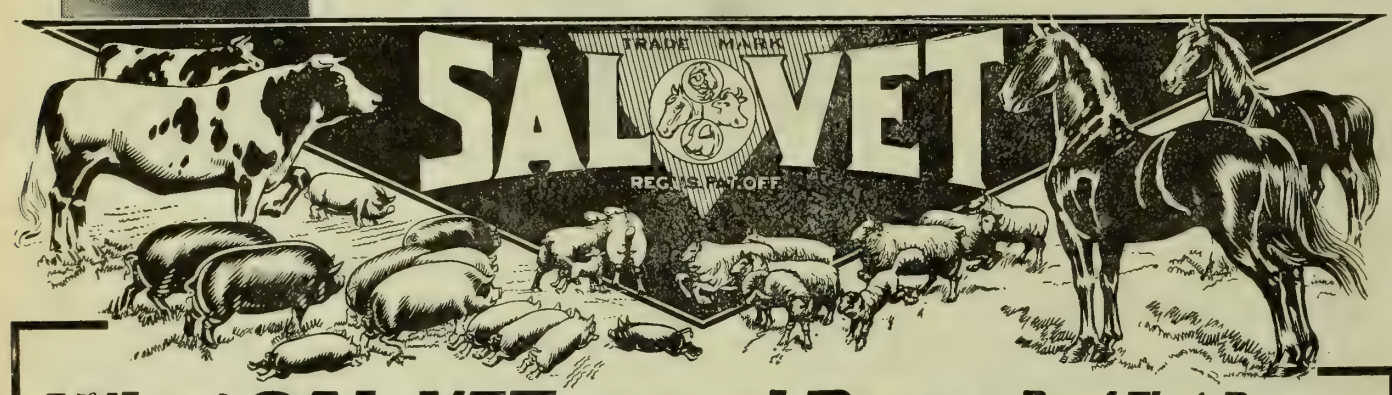
SIDNEY R. FEIL, Pres.
Registered Pharmacist
Graduate of the National Institute of Pharmacy



Tell Me How Many Head of Stock You Have and—

I'll feed them 60 days before you pay. I'll show you how to make your farm animals grow faster—thrive better—put on more flesh on no more feed—make you more money.

I'll Rid Them of Worms or No Pay

I'll drive out the blood-sucking, life-sapping, disease-breeding parasites which multiply in the stomach and intestines, killing off your hogs and sheep, starving your horses and cattle, and stealing your feed and profits. I'll send you enough Sal-Vet to last all your stock 60 days. Simply put it where all your farm animals can run to it freely. ***They will doctor themselves.*** Don't send any money—just the coupon. Fill it out and mail today.

Sidney R. Feil
President.

What SAL-VET Is and Does

Sal-Vet is a wonder-working medicated salt which completely rids farm animals of their greatest enemies—the stomach and free intestinal worms. These deadly pests are the cause of 90% of all live-stock diseases. They keep farm stock in a poor, weakened, money-losing condition—they are the first step to hog cholera, swine plague, horse plague and other contagious diseases.

How SAL-VET Prevents Diseases

Sal-Vet prevents heavy losses when disease breaks out in your neighborhood because it kills and expels these deadly, life-sapping pests and puts every animal on your farm in a healthy, vigorous, worm-free condition—enabling them to better resist these deadly plagues. It sharpens the appetite, improves digestion and makes all stock grow into profit fast because it helps them get the good of all their food. Being a salt, animals like it and run to it freely—and

THEY DOCTOR THEMSELVES!

It requires no mixing—no drenching—no dosing—no trouble at all. Leading agricultural colleges and all prominent live-stock authorities endorse it.

Let me send you a 60-day supply without a penny of pay in advance.

Send No Money—Just the Coupon

All I ask you to do is to fill out the coupon, tell me how many head of stock you have, and mail it to me today. I'll ship you enough Sal-Vet to last all your stock 60 days. You simply pay the freight charges when it arrives and at the end of 60 days report results. If Sal-Vet does not do what I claim you won't owe me a penny. Send the coupon NOW. Address

Proof That Proves From Actual Users

"As the hog cholera is prevalent all through this section, I have been feeding Sal-Vet to my hogs. Since then, I never saw them in better condition in spite of the fact that all around me the cholera is carrying them off by the hundreds."—W. J. BROOKS, Diggs, Va.

Sal-Vet will do all you claim for it. My pure-bred Berkshire hogs are doing fine, and have appetites so keen that they never seem to get enough to eat. Before I began to feed Sal-Vet the same animals were dull, listless and without appetite. They take to the Sal-Vet keenly. Hogs all over our county are dying in large numbers, and many right here in my own town have lost hogs from some cause, but I could not wish mine to do better than they have done since feeding Sal-Vet.—D. E. KNIGHT, Honea Path, S. C.

"Cholera attacked my neighbor's hogs, and one of them died. He started to feed Sal-Vet and has not lost any since. I have been feeding Sal-Vet and have not had a sick hog on the place."—J. J. G. FERRELL, Vandorn, Ala.

"A lot of hogs died in this county from swine plague or cholera. Some of them were within three miles of me, but I have been feeding Sal-Vet, and have not lost a single hog. They are all doing well, eat all I give them and have good appetite for more."—D. A. ROSS, Kingman, Kans., Breeder of Pure Bred Poland Chinas.

"Sal-Vet has been of great service to us; it has kept our hogs and pigs free from worms and, in addition, proved to be a splendid tonic."—J. B. ESPY, Agriculturist, Southeast Alabama Experiment Station, Abbeville, Ala.

"For their own good, I would recommend Sal-Vet to all sheep men. It will destroy every stomach worm in the flock and keep your sheep and lambs free from them and at the same time keep the flock in the pink of condition and health."—ROBERT S. BLASTOCK, Mgr. Sheep Dept., Walnut Hall Stock Farm, Donerail, Ky.

PRICES 40 lbs., $2.25; 100 lbs., $5.00; 200 lbs., $9.00; 300 lbs., $13.00; 500 lbs., $21.12. No orders filled for less than 40 lbs. Never sold in bulk; only in Trade-Marked Sal-Vet packages.

on the many ligaments of this region; they are also found frequently on limbs having short, upright pasterns, due to the greater concussion and consequent irritation and inflammation. The immediate cause of ringbones is undue strain upon the ligaments of the region. This undue strain results from faults of conformation of the parts involved and this conformation being transmitted to the offspring predisposes it to the development of ringbones.

As has already been noted, sidebones are simply the lateral cartilages after they have ossified or "turned to bone." There is no other unsoundness which is so common as sidebones and none are more strongly hereditary. Thirty per cent of all unsound stallions in Kansas have sidebones, yet there is no unsoundness which is so often overlooked and about which the average farmer-horseman knows so little. In the living horse they may be felt as hard, unyielding bony enlargements on either side toward the back part of the foot just inside and projecting above the hoof. Sidebones are found principally in heavy horses and the fore feet suffer most frequently. They produce clumsy, constrained action and often lameness. The principal cause is poor conformation of the feet and the reason we have so many sidebones is because we have so many poor feet.

We all admit the necessity of shoeing and realize the evils that result from improper shoeing, but no specific directions can be given that will cover all cases and conditions. Each is a problem in itself, yet when we consider the functions of the various parts of the foot, we find certain general principles which apply to practically every case.

1. The shoe should be fitted to the foot rather than the foot to the shoe. as is often the case.

2. The shoe should be level and true.

3. The sole and frog should not be touched with knife or rasp except to trim off sparingly the ragged edges.

4. The bars should not be cut away; they are a part of the wall and nature intended that they help carry the body weight.

5. The wall should not be rasped after shoeing. The horseshoer may think it makes the job look neater, but in so doing he is destroying the protection which nature provided to prevent evaporation of foot moisture.

6. As few nails as possible should be used and it should be remembered that high nailing is ruinous.

The foot is the foundation of the animal machine which should always be remembered when select-breeding, pleasure or work horses. It is a region about which we can not be too particular. If the foot is defective either in conformation, quality, or health of tissues, one can foretell the speedy wearing out and ruin of the horse, besides the expense of shoeing and continual treatment. If the foot has the proper conformation and quality, we may expect the horse possessing such a foot to resume each day, without discomfort or loss of energy, the work of the day before. It is time for us all to awaken to the realization of the necessity of good feet in all classes of horses for a horse with poor feet is practically no horse at all.

PARAMOUNT STOCK FARM

Imported and Home-Bred

PERCHERONS, BELGIANS AND SHIRES

My new importation of stallions and mares, which I personally selected, arrived last month. This importation, numbering over 40 head, comprises the best lot I ever imported, and with those already in my barns and pastures, makes Paramount Stock Farm one of the best places in America to come for strictly high class stallions and mares. Among them are prize winners and tops that cost a lot of money. Come to the farm, 2 miles north of Hudson, 9 miles southwest of Waterloo, and see them. Address, mentioning the American Breeder,

WM. CROWNOVER, Hudson, Blackhawk County, Ia.

Belgian Emporium of America

Largest and best collection of Belgians to be found anywhere in America; 150 head stallions and mares, either imported or bred by me. All colors; ages one to five years.

In order to accommodate Belgian customers wanting a Percheron, I have imported a car load of young black and gray Percherons of best quality. Illustrated catalogue free. Fairfax is 8 miles from Cedar Rapids, Ia., on C. & N. W. and on C. M. & St. Paul. Cedar Rapids and Iowa City Interurban passes 3 miles from farms. If coming on it, phone for auto to meet you at Lefebure Crossing.

H. LEFEBURE,

Fairfax, Linn County, Iowa.

W. A. LANG & CO.

Greeley, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS and MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible, and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars. Large CALANDER after December 15th.

PIONEER STOCK FARM.

The Home of the Belgians.

We have for sale the classiest bunch of imported and home-bred stallions and mares we have ever offered for sale. Got first premiums and grand championship in every class we showed in at two state fairs; eight firsts and two grand championships at Oklahoma City and six firsts and two grand championships at Hutchinson, Kas. Any one desiring a first class stallion or mare will do well to see this fine bunch and get prices.

DAVID COOPER & SONS, FREEPORT, HARPER COUNTY, KANS.

IRVINEDALE BELGIANS

Imported and home-bred stallions and mares. All ages. Prize winners and the produce of prize winners. Top quality at reasonable prices. Address,

CHAS. IRVINE,

ANKENY POLK COUNTY, IOWA.

BELGIAN AND PERCHERON STALLIONS AND BELGIAN MARES.

Imported and Home Bred—11 American Royal Prize Winners, 1912.

All of our horses are selected with extreme care as to breeding qualities. They are sound and fully acclimated. Sold with breeding guarantee and terms to suit, at farmer's prices.

Come and See Us, or Write,

BLUE VALLEY STOCK FARM, BLUE MOUND, LINN COUNTY, KANSAS.

IMPORTED PURE BRED BELGIAN

for sale. Color chestnut; weight now 2,150. One of the very few stallions in the United States that weighs a ton in breeding condition. Has the best feet I ever saw under a draft horse. He is a big, smooth, up-standing fellow; a big flat bone; absolutely sound and sure; has plenty of colts to show. This stallion is really a show horse. Was foaled in 1901; my reason for selling, his fillies are in his way. I will sell this horse worth the money if sold before the first of January, 1913. Now if you want to buy one of the best Belgian stallions in the state, come and see this horse, and if I have misrepresented him in any particular, I will pay your expenses both ways. For price or further information, write to **Ed Bundy, Glasco, Cloud County, Kansas.**

IMPORTED CLYDESDALE STALLION.

Merrimac No. 11952, for sale; foaled 1902; will be priced right for quick sale. Good reasons for selling. Address, **Joseph Trimmer, Anita, Cass County, Iowa.**

BELGIAN STALLIONS

for sale. Two Belgian stallions coming two and three years old. Both state fair winners. Write for photo and further description to **C. W. McDermott, Wiota, Cass County, Iowa.**

Missouri Registered Mammoth Jacks AND JENNETS

FOR SALE AT ALL TIMES.

As fine a bunch as can be found on one farm. Guaranteed as represented. Prices that are bargains. Come and see them.

J. T. Watson, New London, Ralls County, Mo.

A. A. FIRKINS. J. E. PARK.

PERCHERON STALLIONS AND MAMMOTH JACKS

Our stallions are all blacks and grays; all young; sound and ready for service. Some ton three year olds, as good as grow. All registered in P. S. of A.

Our Mammoth jacks are Kentucky and Missouri bred; all blacks with light points; all two years old and over; all registered and every one has size and quality; all broke to service. We give a liberal guarantee with all stock. Come and see us or write. Barns in town; 50 miles north of Kansas City and 35 miles east of St. Joe on Rock Island and Burlington.

FIRKINS & PARK, CAMERON, MO.

THREE JENNETS AND ONE STALLION

for sale. The jennets are 5, 7, and 13 years old. They are respectively 13¾, 15½ and 13½ hands standard measure. Bred to Kansas Jumbo 3063. The 7 year old, especially, is big boned, big head and heavy bodied. I only have a three year old jack now and do not like to have the jennets around him in breeding season.

North Chance 44935, is a bay; blind; well built; 16½ hands; standard bred; 1,200-pound stallion; a good teaser and a good driver; $700 buys the bunch or will exchange for registered Percheron fillies. **Wm. H. Young, Cheney, Sedgwick County, Kas.**

JACKS AND JENNETS.

One of the largest collections of large boned black mammoth jacks owned by any one man; 15 to 16 hands standard measure; the kind that will breed the high class mules; the kind all are looking for. Priced to sell. Guaranteed. References the five banks of Lawrence. Address **Al. E. Smith, Lawrence, Kas.** Both phones.

Forty miles west of Kansas City on Santa Fe and U. P. R. R.

THREE GOOD JACKS

for sale. Black Haley 3046; a big Tennessee jack; black with white points; age 4 years; 15.3 hands; heavy bone; a good worker and a sure foal getter; mule colts to show. Price $1,200. Black Joe; 3 years; black with white points; 15½ hands; good bone; smooth and a number 1 worker. Price 1,000. Kalo 2456; black with white points; 15 hands; good bone; good action; 4 years; sired by Logan 598; one of the best breeders in the country. Price $900. Write **Alex Brown, West Mineral, Kas. Box No. 228.**

GREAT HERD JACK

KENTUCKY STATE FAIR WINNER

for sale. Registered black mammoth jack; 7 years old; 15¾ hands standard; extra heavy bone; heavy body; fine head and ear. Good enough for any herd of jennets. Recommended for jennets only. Sure foal getter. Price $1,000.

Also extra good black registered jack; 15½ hands; heavy boned; blocky; 8 years old. Good performer on mares or jennets. Good breeder and sure. Price $800.

These jacks are both good ones. **Chas. A. Galt, Mound City, Linn County, Kas.**

FOR SALE.

Two good black jacks, two registered trotting stallions, one coach stallion, one Shetland stallion and one registered trotting mare.

This stock is all good and in good shape; has been used in my breeding barn; must be sold soon. If you want the best stock, at the least price, come and see or write. **Frank Sheets, Mooresville, Morgan County, Ind.**

JACKS FOR SALE.

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention the American Breeder. **S. W. Jetton & Co., Murfreesboro, Tenn.**

Large 1,000-Pound Black Jack

for sale; big boned; good style; best breeder and best performer I ever saw. Guaranteed in every way or money refunded. A bargain if sold by the first of January. C. W. Fansler, Prairie View, Phillips County, Kan.

BLACK SPANISH JACK

For sale or trade; one good, young black Spanish jack; good bone; fine action, style and finish; quick server; mules to show; five years old. E. M. Browneller, Deweyville, Hancock County, Ohio.

JACKS AND PERCHERON STALLIONS

Best lot of jacks ever offered at Quiet Glenn; the big kind with herd headers among them a specialty. Buy this fall, get choice and save money. — G. M. SCOTT, Rea, Andrew County, Mo.

OUT OF SEASON PRICE

on 14 jacks and jennets from two to eight years old. In this offering will be my herd jack, Klondike; he is a good one; would not offer him only I must change jacks; have some of his colts old enough to breed. **Geo. T. Ponge, Garrison, Christian County, Mo.**

WANTED—A GOOD DRAFT STALLION.

Have more jennets than I need and would like to exchange. Full description given on application; jennets are bred to one of the best jacks in Texas. Address, **Horseman, Water Valley, Tom Green County, Texas.**

A FEW GOOD JACKS.

for sale; two to seven years old; good height, bone and color. G. H. Minton, Forest City, Holt County, Mo.

BLACK JACK

for sale; 26 months old; 13¼ hands standard measure. **Nick Wagoner, Menlo, Thomas County, Kas.**

Results of the Hen Test

Pen of Rose Comb Reds Led With 1,042 Eggs. White Wyandottes Second, S. C. W. Leghorns Third, and Barred Rocks Fourth. Leading Hen a White Rock, Lays 281 Marketable Eggs in the Twelve Months.

By T. E. Quisenberry, Superintendent Missouri State Poultry Experiment Station.

The much talked of Missouri National Egg Laying Contest closed at the State Poultry Experiment Station at Mountain Grove, Mo., the first of last month. The results have been very satisfactory.

The results of the first contest have not been especially startling, and neither did they prove or attempt to prove that any one variety possessed all the good qualities. The leading pen was No. 107, R. C. Rhode Island Reds which made a record of 1,042 eggs for five hens, or an average of over 208 eggs per hen. The best individual record was made by Lady Showyou, White Plymouth Rock hen No. 717, which laid 281 eggs in twelve months. This hen lacked one egg of equaling the best record in this country which was 282 eggs by a Barred Rock hen at Gueleph, Canada. Lady Showyou, however, laid a full sized egg, weighing on an average of a little more than two ounces each and with a good strong shell on each egg. We are told by Prof. Graham of Guelph, that his 282-egg hen laid a very small egg with a very poor shell, so Lady Showyou was far the most remarkable performer of the two when these facts are considered.

There were 655 hens in this contest and they laid a total of 87,843 eggs, or an average of over 134 eggs per hen. Considering the fact that more than a dozen pens lacked two or three months of being mature at the time the contest begun, and also considering the fact that more than half of the pens were made up of hens and several of them contained hens three and four years old, we are reasonably well satisfied. Most of these birds had been carelessly and promiscuously bred with no special idea to increase egg production. As the average hen only lays 80 eggs per year, we do not feel that 134 eggs is a bad average.

The yield by months for the 655 hens was as follows: November, 3,118; December, 5,082; January, 3,203; February, 6,442; March, 10,828; April, 12,458; May, 11,478; June, 9,798; July, 8,873; August, 7,015; September, 5,716; October, 3,832.

Prize Winning Pens.

1st Pen, No. 107—R. C. Rhode Island Reds, D. E. Hall, California, Mo., 1042 eggs.

2nd, Pen No. 52—White Wyandottes, P. J. Jansen, Little Rock, Ark., 1,015 eggs.

3rd, Pen No. 13—S. C. W. Leghorns, Walter Hogan, Petaluma, Cal., 991 eggs.

4th, Pen No. 85—B. P. Rocks, Brooks Sanitary Hennery, Morgan Park, Ill., 967 eggs.

Prize Winning Hens.

1st, Hen No. 717—White Plymouth Rock, J. A. Bickerdike, Millersville, Ill., 281 eggs.

2nd, Hen No. 602—C. R. I. Red, D. E. Hall, California, Mo., 255 eggs.

3rd, Hen No. 381—B. P. Rock, M. W. Baldwin, Sioux City, Ia., 245 eggs.

The prize for the pen laying the greatest weight in eggs was won by pen No. 13, S. C. W. Leghorns, shown by Walter Hogan, Petaluma, Cal., weight 131 lbs., 2 oz. This pen of Leghorn hens weighed less than four pounds each, and it will be seen from the above figures that each hen laid more than six times her own weight in eggs.

Fifty-nine hens laid 200 eggs or more each, as follows:

No. 717, W. P. Rock, 281; No. 602, R. C. Red, 255; No. 381, Barred P. Rock, 245; No. 19, Ancona, 241; No. 372, S. C. Red, 236; No. 613, Barred P. Rock, 235; No. 545, White Orpington, 232; No. 488, White Wyandotte, 232; No. 525, Silver Wyandotte, 230; No. 198, S. C. W. Leghorn, 228; No. 393, S. C. Red, 228; No. 119, S. C. W. Leghorn, 225; No. 179, S. C. W. Leghorn, 223; No. 79, R. C. W. Leghorn, 223; No. 401, Silver Wyandotte, 223; No. 396, S. C. Red, 223; No. 547, Buff Orpington, 223; No. 463, Barred P. Rock, 221; No. 89, Ancona, 218; No. 718, W. P. Rock, 218; No. 339, Buff Orpington, 218; No. 418, Golden Wyandotte, 217; No. 402, Silver Wyandotte, 217; No. 487, White Wyandotte, 215; No. 634, Silver Wyandotte, 213; No. 115, S. C. W. Leghorn, 212; No. 541, White Orpington, 211; No. 64, S. C. Brown Leghorn, 210; No. 39, S. C. W. Leghorn, 209; No. 636, Silver Wyandotte, 209; No. 386, S. C. Red, 209; No. 300, S. C. Black Minorca, 208; No. 527, Silver Wyandotte, 208; No. 601, R. C. Red, 208; No. 139, S. C. W. Leghorn, 207; No. 788, Silver Wyandotte, 207; No. 863, Black Orpington, 207; No. 455, White Orpington, 207; No. 523, Silver Wyandotte, 206; No. 596, R. C. Red, 206; No. 858, Black Orpington, 206; No.

FOR SALE. S. C. B. Leghorn roosters and yearling hens. $1 each or 6 for $5. Mrs. H. A. Brookhart, Arbela, Mo. R. No. 1.

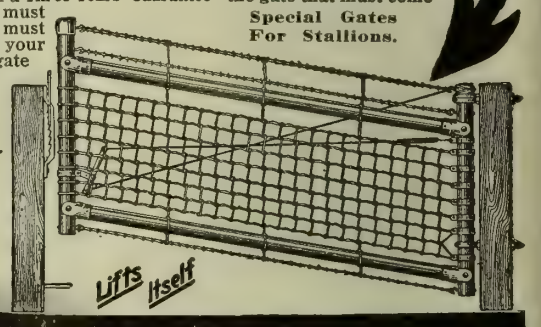
MONEY SAVING GATE BOOK FREE

GET YOUR COPY TO-DAY

Free



I want every reader of this paper to have and read my Money-Saving Gate Book. You can have **one copy free if you will write me at once.** This booklet tells you all about gates in general and my American Self-Lifting Galvanized Steel Gate in particular. This booklet has been, and is, proving a money-saver to thousands of farmers and ranchmen everywhere who now acknowledge my

American Self-Lifting Galvanized Steel Gate

to be the "perfect all service farm gate" Hog-tight and Bull-strong. It has won first prize at every State Fair wherever exhibited. You must see this gate yourself to fully appreciate its many points of superiority. The 2-inch high-carbon drawn steel galvanized tubing from which the frame and couplings are made; the Automatic Equalizer which allows the gate to **Lift Itself** and swing out clear over uneven ground or snow; the Ratchet Stretcher System which insures tight wire and a rigid gate forever; the ease with which a woman or child can open or close this gate—and many other superior advantages found in no other gate.

Remember, This is the gate sold on a **Three Years' Guarantee**—the gate that must come up to the claims I make for it—that must be absolutely as represented—that must please you in every way, or you get your money back by simply returning the gate to your dealer. Write me today for my **FREE Gate Book** and name of nearest dealer where you can see this gate in operation.

The prize for best record by a pen of ducks was won by pen No. 129, New York, Indian Runner ducks, 674 eggs.

The best monthly records were as follows:

Month.	Pen No.	Eggs.
Nov...	112, Black Orp'gt's, Ind.	101
Dec...	103, S. C. Reds, Fla.	110
Jan...	118, Buff Orp'gt's, Mo.	105
Feb...	118, Buff Orp'gt's, Mo.	107
Mch...	107, R. C. Reds, Mo.	126
Apr...	84, B. P. Rocks, Neb.	137
May..	33, S. S. Hamburgs, Mo.	130
June..	20, S. C. W. Leghorns, Ga..	119
July..	13, S. C. W. Leghorns, Cal..	119
Aug...	81, Barred P. Rocks, Mo.	107
Sep....	33, S. S. Hamburgs, Mo.	97
Oct....	64, Silver Wyandottes, Ia..	90

The average number of eggs laid by each hen and the average amount of feed consumed by each hen of those varieties which had ten or more hens entered, and which averaged more than 120 eggs per hen for the year, is as follows:

	Eggs Per Hen	Pounds Grain	Pounds Dry Mash
Silver Wyandottes ..	160	35	35.3
S. C. Reds	156	35	38.6
Black Langshans ...	156	35	50
Black Orpingtons ...	155	35	44
White Orpingtons ..	150	35	39
R. C .Reds	150	35	32.6
Buff Orpingtons	147	35	30.3
S. C. B. Minorcas....	145	35	44
S. C. W. Leghorns ..	143	34.8	32
Anconas.	139	34.8	30.5
Indian Runner Ducks	131	0	121
R. C. W. Leghorns....	127	34.8	23.3
Barred P. Rocks.....	126	35	44.2
White Wyandottes ..	125	35	33
S. C. Brown Leghorns	122	34.8	31.5
Buff Plymouth Rocks	120	34	45

The above includes good and bad producers and both young and old hens. Several varieties ran considerably below these in average eggs per hen but about the same amount of food consumed. One pen of mixed bred chickens, entered as "scrubs or mongrels," averaged 148 eggs per hen. The cost of the grain fed these hens averaged about 1 1-3 cents per pound, and the cost of the dry mash was nearly two cents per pound. It can be seen from the above how far the Australians are in advance of the breeders of this country in breeding for egg production. The leading pen in this contest averaged more than 208 eggs per hen, but the leading pen in an Australian contest which recently closed averaged more than 250 eggs per hen. Also, in the same Australian contest, 360 hens gathered from 60 different breeders made an average of nearly 200 eggs per hen for the entire 360 hens. But they have been conducting these contests in that country for ten years or longer and the people have been educated to breed for egg production. We hope to stimulate some such effort in this country.

HOLIDAY MARKET DULLNESS DELAYED.

(Continued from page 4.)

at Western markets thus far, but in the next ten days some are expected. The short fed class, the kind that sell at $8 to $9, are good in quality and killing reports show that they are making good beef. Such cattle have been turned to feed lots after a season of excellent grazing, and most cases have had no more than enough grain to give the meat firmness. The receipts of grass fat steers are mostly the tailings and from small outfits. The big pastures have been cleaned up for two weeks. General conditions favor an active demand and for fat cattle until after the holidays. Receipts are expected to be liberal.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$9.40@10.75
Good to choice steers	8.25@ 9.35
Fair to good steers.....	7.75@ 8.20
Common to fair steers	5.00@ 6.70
Meal fed, choice	7.25@ 8.25
Meal fed, common to fair..	5.25@ 7.20
Grass fat	4.50@ 7.75

Higher Butcher Cattle Prices.

In the past two weeks prices for butcher cattle were strong to 25 cents higher. Quotations took on a higher range, due in part to quality, but largely owing to a broad demand from small butchers. In many localities butchers say they cannot get cows and heifers for slaughter, and they are being forced to buy on the open market. Packers are taking "canner" grades with the same eagerness as formerly. Fed cows and heifers will be offered more freely in the next few weeks, and some prime, tidy weight heifers for the Christmas trade would draw high prices. Bulls were quoted up 25 cents, and veal calves continued firm.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice.	$6.50@7.25
Fair to good	5.00@6.45
Common to good	4.35@4.95
Canners.	3.35@4.30
Heifers—	
Choice fed	8.50@9.25
Good to choice	6.50@8.45
Common.	4.50@5.50
Plain to fair	5.50@6.45
Veal Calves	4.50@9.50
Bulls.	3.75@6.50

Country Short on Feeders.

In the past two weeks commission men and buyers have held more orders for thin cattle than they could fill, and while prices were quoted up only 15 to 25 cents, they were at the danger point. Eastern feeders are eager for heavy half fat steers and some weighing 1,200 to 1,350 pounds have been taken at $7.85 to $8.25. They will be fed only a short time before turning to market again. The West is still anxious to get light weight cattle for roughing through the winter and turning on grass in the spring. Stock cows, heifers and calves are in active demand. Milch cows are scarce at firm prices.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.50@ 8.25
Good to choice feeders....	6.50@ 7.40
Plain to fair feeders	5.75@ 6.45
Selected stockers	6.65@ 7.25
Good to choice stockers...	6.00@ 6.60
Plain to fair stockers.....	5.25@ 5.85

SHORTHORN CATTLE.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

Stock cows	3.50@ 4.50
Stock heifers	3.85@ 5.25
Milch cows .....35.00@90.00	

Narrow Range In Hog Prices.

In the past two weeks prices for hogs fluctuated 10 to 20 cents and today were net unchanged to a shade lower compared with two weeks ago. The extreme range in top prices in the two weeks was $7.70 to $7.95, and the bottom quotations showed practically the same swing. Prices at all markets are practically the same, though on several days quotations at river markets were higher than in Chicago. Heavy hogs are shown a premium by a good strong margin, and pigs are some higher. Fewer sick hogs are coming than two weeks ago, though considerable sickness is reported in the country. Receipts have been moderate.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Dec. 2.	$7.50@7.82½	$7.45@7.77½
Tuesday.	7.40@7.73½	7.50@7.80
Wed., No. 27.	7.40@7.75	7.60@7.90
Thursday. . ..	Holiday	7.60@7.95
Friday.	7.50@7.80	7.59@7.80
Saturday. . .	7.60@7.90	7.60@7.75

The following quotations are for hogs:

Choice, 250@300 lbs.....	$7.65@7.75
Choice, 200@300 lbs.....	7.60@7.72½
Choice, 200@245 lbs.....	7.50@7.70
Medium weight	7.45@7.70
Light weight	7.15@7.60
Common to fair	6.25@7.30
Stags.	6.00¾7.50
Boars.	4.50@6.75
Bulk of sales	7.50@7.70

Higher Prices for Sheep.

Demand for sheep has improved in the past two weeks and prices were quoted up 25 to 50 cents, to the highest level for the year. The range movement is about over, but Chicago has been receiving large supplies of native grassers. From now on fed sheep will move, and prices take on a higher range owing to improved quality. Choice lambs are quoted at $7 to $7.75, yearlings $5 to $6, ewes $3.75 to $4.40, wethers $4 to $4.75.

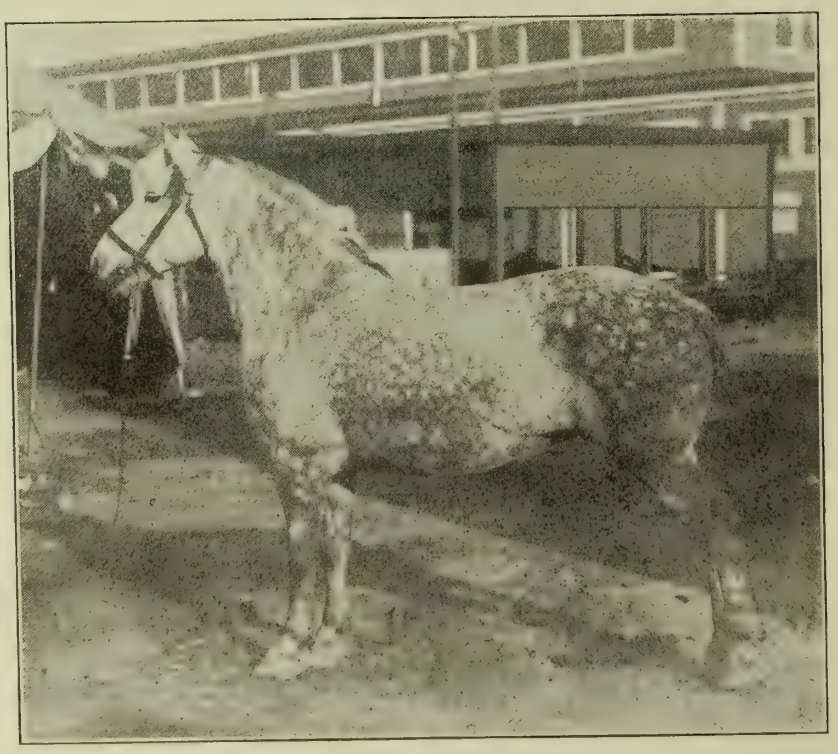
Live Stock Receipts.

Live stock receipts at the five Western markets in November were 712,000 cattle, 1,348,850 hogs, 1,165,475 sheep. Compared with the same month last year this is a decrease of about 98,000 cattle, 380,000 hogs, and an increase of 20,000 sheep. Chicago, Kansas City and Omaha show the principal decrease in cattle, and Kansas City, Chicago and St. Louis the decrease in hogs. For the eleven months this year total receipts at the five Western markets were 7,300,000 cattle, 15,500,000 hogs and 11,975,000 sheep, or a decrease of 675,000 cattle, 50,000 hogs and an increase of 235,000 sheep, compared with the eleven months in 1911.

MODERN HORSE BREEDING.
(Continued from Page 5.)

he said, "and receives so much valuable information, he does not boost it, as a rule, because he is afraid his competitor will attend." It is human nature for these individuals to want to keep a monopoly in their locality, consequently other breeders in the immediate locality may not be encouraged to attend. This, however, is a very shortsighted policy, as it would be an important event in live stock history if the owners of all good sires could be thus enlightened, and all become boosters for improved methods. Those who are opposed to the more modern principles of horse breeding soon wage a severe campaign against those who practice up-to-date methods. Quite frequently they start false reports that gain a considerable strength.

There is another reason that many horse breeders have not attended the school, and that is because they do not want their acquaintances to think they have found it necessary to be enlightened on certain subjects. They haved posed these many years as experts, and do not like to be humiliated by admitting they have attended a school to learn what their years of experience could not give them. It is common for our best horse breeders who attend the breeding school to say that they have found out they knew little about horse breeding.



The Graham Scientific Breeding School extends an invitation to every horse breeder to visit this school Monday morning, December 16, and if the school is not perfectly satisfactory in every respect to the student, the full tuition will be refunded without any questions. At every term of school the offer is made to refund the money in case of any one who is not absolutely satisfied, and not a single student up to this date has ever asked for his money.

Mr. Breeder, can you afford to come to Kansas City and investigate this breeding school? Since it has been attended by breeders from California, Pennsylvania, Montana, Mississippi, Mexico and Belgium? Are the horse breeders going to let this school die when it is the only institution from which they can obtain expert information on horse breeding?

Mr. Breeder, will you be a leader in your profession or do you intend to continue to breed, unknowingly, all the diseased mares in your community and infect good, clean, healthy mares by the hundreds? If the horse breeders would stop to think of the great benefit derived from knowing diseased mares they would not hesitate to attend this school. The average breeder makes from 20 to 50 worthless services every season, many of which are made on diseased mares that in turn make other mares barren. Nearly every one of these worthless services can be eliminated.

Mr. Breeder, are you going to lead a life that requires you to be at your barn from daylight until dark every day through the breeding season, or will you lighten your work to one or two hours' labor each day, giving you time for other services? One week's time at the next term of school will save several weeks' time during the next breeding season. The information you receive at this school is not only for one season, but for life. The time to begin is at the next term of school, December 16 to 21. Make arrangements to be on hand. Remember the date.

Mr. Breeder, do you wish to double the income from your breeding stock without increasing the investment?—Advertisement.

LEE BROS'. GRAND CHAMPION PERCHERON MARE, GALETTE, TO BE SOLD IN THEIR PUBLIC SALE, DECEMBER 17.

THIS BRIDLE WILL HOLD 'EM

GUARANTEED TO HOLD ANY STALLION OR JACK.

Auctioneers, or any young men who want to get a further insight into one of the most profitable and most rapidly growing professions connected with agriculture, ought to read what some of the graduates say in the advertisement of the Missouri Auction School on the back cover of this paper. Here is an institution that has grown from a comparatively small start at the good town of Trenton, Mo., until now it has become a national institution with headquarters at Kansas City. The most reliable information that anybody can offer concerning it is included in the statements of the graduates themselves to which we have referred. Whenever mentioning this school or making any inquiries concerning it, kindly give the American Breeder credit for calling your attention to it.

Saddlers, Harness Horses, Ponies.

SADDLERS FOR SALE.

We have on hand the greatest collection of saddle stallions of any one firm in the world. Fifteen head of the famous Rex McDonald breeding—the greatest producer of the saddle family. Write, Phone or Wire for Dates

The first advertising page of this paper contains the announcement of two great sales of Percheron stallions and mares which no Western breeder will want to miss. Probably no two sales ever held in the West have contained greater live stock values than these two. The first is the sale of Lee Bros., which will be held at the Kansas State Agricultural College at Manhattan, Kas., December 17, and will include the prize winning Percheron stud shown by Lee Bros. at the Western fairs this year. The second sale is that of J. C. Robison and will be held at Whitewater Falls Farm at Towanda, Kas., an institution famous all over the United States on account of the champion stallion, Casino, and hundreds of high class Percherons carrying his blood which have been distributed through public and private sales all over the Trans-Mississippi territory. These sales have been ar-

ranged with one day intervening so as to give buyers and visiting breeders plenty of time for inspecting reserve stock, as well as sale stock, and for a visit at the Kansas Agricultural College which is one of the largest of its kind in the world.

A two days' dispersion sale of Percherons is advertised in this issue by Fred W. Schwab and W. H. Welch of Lexington, Ill. The first day of the sale will be January 2 and will be occupied by Mr. Schwab who sells at Lexington. On January 3, Mr. Welch will sell his stock at Pontiac, Ill. The combined offering numbers about 50 head of stallions, mares and colts.

For the last time we call special attention to the important series of draft horse sales being held in Illinois this month, W. S. Corsa, White Hall, Ill., sells Percherons December 10; J. H. Decker of Piper City, Ill., sells Percherons December 12; Trumans' Pioneer Stud Farm of Bushnell, Ill., sell Shires and Percherons December 12 and 13; D. K. Roth, Gibson City, Ill., sells Belgians and Percherons December 13. All these sales include a good proportion of high class draft mares, mostly in foal to stallions of exceptional merit. We ask every one of our readers in a position to make use of either mares or stallions of these breeds, to inquire for catalogues if there is still time, and to attend the sales if possible. Kindly mention the American Breeder in connection with all inquiries.

Clean, bright prairie hay, the very best possible roughage for work horses on grain, is advertised for sale by T. P. Heffern of Piqua, Kas. Please notice the advertisement and see what Mr. Heffern can save you on direct shipments. Don't fail to mention the American Breeder in writing him.

The latest important Percheron sale announced is that of C. W. Lamar & Co., to be held at the barns of this importing firm in Salina, Kas. The date of the sale is December 27. This will be one of the largest one-day sales held this winter, as the offering numbers 57 head and includes 24 mares, from two to five years old, that are in foal; there are 10 fillies and colts, not bred, and 14 stallions, most of them old enough for service but none of them over five years old. The stallions are included in the offering largely as an added attraction for those who are looking for both mares and stallions. In addition to the sale offering Lamer & Company have in their barns 40 head of Percheron and Belgian stallions, all young stock, and weighing from 1,700 to 2,100 pounds, which are, of course, being held for sale at private treaty. We ask especial attention to the public sale offering at this time and request that our readers write at once to Lamer & Co. for catalogue and mention the American Breeder in writing.

We ask all stock men to notice the advertisement of the famous live stock conditioner known as "Sal Vet," which appears in this issue, and to kindly mention the American Breeder when writing the manufacturers of this remedy.

A big sale of grade farm mares and work mules will be held Saturday, December 28 at the barns of C. W. Lamer & Co., at Salina, Kas. Lamer & Co. hold a big sale of Percheron mares and stallions on the day preceding, so that altogether in the two days there will be over 150 head of horses and mule stock sold to the public.

If there are any of "our" folks who have not yet secured from the American Farm Gate Company one of their fine free illustrated Gate Books, telling about their "cuss-less" gate; they should at once write to the company for a copy. Every reader of this magazine is entitled to one of these illustrated booklets and if any farmer or breeder is contemplating buying a gate he will find this book of much help. This firm's advertisement tells about their three year guarantee. Address the American Farm Gate Company, 1457 Elmwood Avenue, Kansas City, Mo., for their catalogue today.

Missouri registered Mammoth jacks and jennets are advertised for sale by J. T. Watson, New London, Ralls County, Mo. Here is a great breeding farm that makes a specialty of the good ones, at prices that are bargains.

Read the advertisement in this issue of Ed Bundy, Glasco, Kas. He is offering his pure bred Belgian stallion and the ad gives a very good description of the horse. Write him, if you are interested.

Read the advertisement in this issue of Frank Sheets, Mooresville, Ind. He is advertising several head of good horses at a bargain. It will undoubtedly pay you to investigate this.

T. P. Heffern, the "prairie hay man," of Piqua, Woodson County, Kas., has two good Percheron stallions and two jacks for sale.

If you have a good draft stallion that you would like to exchange for jennets, see the advertisement in this issue signed "Horseman," Water Valley, Tex., and write him for full information.

Chas. E. Maycox, 502 Waldheim Bldg., Kansas City, Mo., advertises a fine stock farm 14 miles from Kansas City at $75 per acre.

Look up the farm bargains advertised near Kansas City by Frank E. Lott, 303 Finance Bldg., Kansas City, Mo.

Wm. H. Young of Cheney, Kas., is advertising three jennets and one stallion for sale in this issue. His ad gives a good description of what they are, but if you are interested, write him for further particulars.

Mrs. H. A. Brookhart of Arbels, Mo., starts her chicken ad in this issue of the American Breeder. Mrs. Brookhart is one of the reliable breeders of Missouri, and if you are in need of chickens it would undoubtedly pay you to write her.

If you are looking for a Percheron stallion, write to Fred Chandler, Chariton, Iowa, and let him tell you about the two he is advertising in this issue.

David Cooper & Sons, the well known Belgian breeders of Freeport, Kas., starts his advertising in this issue. Mr. Cooper says they have the classiest bunch of stallions and mares they have ever offered. Read the ad and then write them for further information if you are in the market.

If you would like to buy a carload of black mammoth Kentucky jacks that are good all around, Joe E. Wright of Junction City, Ky., has them. See his ad in this issue.

J. E. Lewis of Stewartsville, Mo., has a real bargain advertised in this issue. See what he says about the stallions he is offering.

If you are in the market for a stallion, don't fail to read the advertisement in this issue of E. R. Smith, Fairfield, Ia. He undoubtedly can please you.

If you want to exchange land for a stallion, E. R. Smith of Fairfield, Ia., has a good Shire stallion he wishes to exchange. Read his ad in this issue.

If you are looking around for a good jack, don't fail to see the one C. W. Fansler, of Prairie View, Kas., is offering at a bargain. His ad appears in this issue.

W. T. Rodecker of Mulberry Grove, Ill., is going to leave the state and is offering his imported Belgian stallion and two good jacks very cheap. It would pay any one in the market to investigate this stock.

Al. E. Smith of Lawrence, Kas., starts his ad in this issue. It would pay any one in the market for jacks or jennets to visit Mr. Smith's place and see the stock he has for sale. Mr. Smith guarantees everything he sells.

Harry D. Hooper, of Athens, Ohio, is in the market for a registered Morgan stallion. His ad is in this issue. What have you?

Have you ever tried the "Spohn" remedy for distemper, pinkeye, influenza, etc.? If you have not and you have any trouble of this sort among your horses it would undoubtedly pay you to try it. Write to the Spohn Medical Co., Goshen, Ind., for full information. Their ad appears regularly in our columns.

Chas. A. Galt of Mound City, Kas., is advertising in this issue his great herd jack, a Kentucky state fair winner, for sale. This is a jennet jack and Mr. Galt says he is a sure foal getter. He is also advertising another jack in this issue. See the ad and if in the market, write him.

If you have a good mare that you would like to exchange for a registered Percheron stallion, read the ad in this issue of B. B. McEndarfer, Waterloo, Ind., and write him for full particulars.

H. T. Brown & Co., of Lexington, Ky., are advertising some good jacks and stallions in this issue. Write them if you are in the market.

Write J. F. Cook, Lexington, Ky., if you are looking around for a jack or a saddler. He has some good ones. See his ad in this issue.

C. C. Walker, formerly of the firm of Walker Bros., Oklahoma City, Okla., but now of Keota, Ia., is offering for sale in this issue ten good registered stallions in order to close the partnership with his brother. If you are in the market do not fail to read the ad and write Mr. Walker at Keota, Ia., for full particulars.

T. J. Ryan & Co., of St. Mary's, Kas., have some splendid bargains advertised in this issue in the way of Kansas farms. Do not fail to write them if you are thinking of changing locations. Read their ad.

KANSAS CITY, MO.

Print anything from a Business Card to a Catalog or Book. Best work, reasonable prices. Binding, halftones, zinc etchings, etc.

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.

Stallion Blankets

Made to Order—Get a Fit

A good, substantial blanket is a necessity for all valuable animals. Our blankets are treated with a preparation to prevent horses from tearing them. In ordering, send measure from top of collar to the tail and heart girth measure. We can fit any horse, jack or mule.

Blankets made of best heavy material, substantially lined. Surcingle material sewed to blanket to prevent tearing. Leather front fastener. Express paid. Price each, $4.00; three blankets for $10.

Kansas City Impregnator Co.

12th and Central Sts. Kansas City, Mo.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price, $5.00.

O. P. WILSON SERUM AND INSTR UMENT CO.,
3754 Wayne Avenue, Kansas City, Mo.

The manufacturers of Absorbine, advertised regularly in this paper have sent us the following letter from one of their customers: "Mr. W. W. Goodliff, Bolivar, N. Y., writes under date of February 9, 1912: 'I have taken a bunch off a horse's knee with Absorbine and glycerine that a veterinary said was ruined for life. Today he is worth $2,000. I am handling a good many horses and think that Absorbine will cure most anything.'"

Big Percheron mares and a smashing two year old stallion are advertised by J. W. Barnhart, Butler, Mo. A span of the three year old fillies will weigh over 3,400.

To the American Breeder: "We have just received word that our new importation of stallions and mares have been shipped and they will arrive here within the next few days. Anyone wanting draft stallions or mares will have no difficulty in finding here just what they want. Do not delay but come and make your selection early and you will not be disappointed. If you are in the market for anything in this line, come or write us right away. —Taylor & Jones, Williamsville, Ill.

Bell Bros., of Wooster, Ohio, report the following sales: "Among the sales made by our firm during the months of October and November are included the pair of two year old imported chestnut Belgian mares, which were purchased by Mr. Chas. Hammond of New Concord, Ohio. This pair of mares sired by the great Belgian stallion, "Marquis de Kleyem," were exhibited at the Ohio, New York and Michigan state fairs this year and at each place they were awarded the first and second prizes in either classes, the one mare "Snel de Kleyem," being the champion at the Ohio State Fair. Her half sister, "Polka de Kleyem," is a close rival and the two mares when placed together make a sight that is not often found in any breed of horses.

The Borden Stock Farm of Tonti, Ill., are advertising some good stallions and jacks in this issue. See the advertisement and write them for further particulars.—Advertisement.

Don't Have a Blind One

"VISIO"

An Absolute Cure for Moon Blindness

(Opthalmia), Cataract and Conjunctivitis

Shying horses all suffer from diseased eyes.

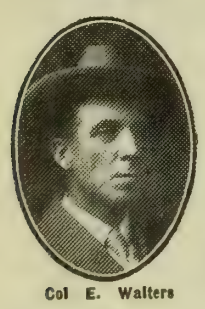
BE AN AUCTIONEER · GET MY FREE BOOK IT TELLS HOW

Col. G. A. Hendrickson

Yes Sir!! That's what hundreds of graduates from this School do every season, and I have their own written statements to prove it. You know from personal experience that competent, wide-awake auctioneers are in demand. That their services are contracted for months in advance. That the work is not only pleasant and agreeable—but without exception one of the highest paid professions possible to engage in. You either know personally or by reputation Col. H. S. Duncan, Col. G. A. Hendrickson, Col. R. L. Harriman, Col. A. W. Cies and Col. E. Walters, all of whom are instructors in the **Missouri Auction School.** The average yearly income of these world-famed auctioneers would startle you. Why, it is not unusual for these men to make as much as $200 in a single day. Think of it! $200 for a few hours' work and work they enjoy. **YOU** can prepare yourself to be as successful as these men, and in only four weeks' time. There is a constant demand for competent auctioneers right in your own neighborhood. You need not go outside of your own community to find a sufficient number of engagements to keep you busy. **Supply this demand and your success is assured. Remember, ONLY FOUR WEEKS** of your time is necessary to enable you to become a successful auctioneer. Read what a few of our graduates say about me and my school. Then write me today for my big **Free** 96 page illustrated catalogue.

TO YOU FATHERS.—Investigate my school and my methods. Auctioneering is one profession that will not only fit your sons for an independent money-making profession, but one which they can engage in right in their own community and still live at home.



READ WHAT THESE GRADUATES SAY:

Col. R. L. Harriman

Col. H. S. Duncan

Col E. Walters

Col. A. W. Cies

$27,840 IN ONE BID.

COL. W. B. CARPENTER:
Dear Sir: I have made five sales this week and have a sale of twenty horses and two stallions. These horses are two of the best horses in this country and weigh 2,000 pounds apiece. Am dated now for every day in February and four over in March. Must tell you of a land sale I made. I sold 240 acres of land to the highest bidder. The land is six miles from our town and sold for $116 per acre or $27,840, which was $16 an acre more than was expected. Respectfully,
Madison, Nebr. O. V. SCHEER.

A SCHOOL OF REAL EXPERIENCE.

COL W. B CARPENTER:
Dear Sir: Being a graduate of the Missouri Auction School, the August term, 1910, I feel it my duty as well as a pleasure to tell my experience with the instructors of this school. I found them all to be gentlemen and professionals in this line. I would advise anyone intending to become an auctioneer to take a course in the Missouri Auction school. There is where you will get the real practice in selling all kinds of property from a monkey wrench to pedigreed stock and real estate. Without the instructions received in all kinds of sales, besides the real practice of selling at all kinds of sales, I would never have made an auctioneer if I had lived to be as old as Noah. I consider the instructions received in pedigreed stock worth twice the tuition if I never cried a sale in my life. Wishing the instructors of the M. A. S. the best of success, I am a walking advertisement for this school. H. H. OPPEDAHL
Lake Mills, Ia.

HIS TIME ALL TAKEN.

COL. W. B. CARPENTER·
Dear Sir: When I came home from the Missouri Auction school in January, 1908, and hung out my shingle in Madison for work, there were five auctioneers doing business in this town. Today there is only one besides myself. I don't write this to boost myself, but just to show you that a little training like you get at the M. A. S. won't hurt you at all, if you are thinking of taking up auctioneering. I have had very good success. Have made a number of real estate sales. Have one dated now of 240 acres for February 3rd, and several pure-bred sales for January and February. Am dated December 29, 31, January 10, 12, 17, 18, 19, 24, 25, 30 and 31. February 2, 3, 4, 6, 7, 8, 9, 10, 14, 15, 16, 17, 18, 20, 21, 22, 23, 24, 28. So you can see that I am busy the larger part of the time. I hold the record of selling the highest-priced horses in the county this fall. Respectfully, OTTO SCHEER.
Madison, Nebr.

$30.00 IN ONE HOUR AND THIRTY MINUTES.

COL. W. B. CARPENTER:
Dear Sir: I want to thank you and the rest of the instructors for my success in the auction business. Without the help of the Missouri Auction school I would not have made good. I cried a sale for W. C. Franklin in November. I made the sale in one hour and thirty minutes and received thirty dollars for my work. I have made seventeen sales up to date. I have one competitor, and for some reason I have made every sale that has been made in this part of the country.
Blanchard, Okla. W. W. YODER.

SAYS M. A. S. MADE HIM.

COL. W. B. CARPENTER:
Dear Sir: I was a student and a graduate of the January class of the Missouri Auction School, 1910. I have just finished a very good season with 15 sales to my credit. I consider this good for a beginner. I will say to those who want to become auctioneers that time and money spent at M. A. S. is well spent, under the direction of Col. Carpenter, Col. Cies, Col. Duncan and Rev. Hendrickson. The gentlemen just mentioned in the foregoing, with other men, make the institution second to none. The advantage of the privilege to have actual practice in sale work makes an important point to consider when contemplating qualifying yourself for an auction salesman. But here I want to say that if I had not attended the M. A. S. I would never have been an auctioneer. I considered the matter of another school of auctioneering and also the M. A. S., but I decided the M. A. S. was the school for me. Wishing the school the credit that it deserves, I am Respectfully,
Pemberton, Ohio. F. W. CLARKE.

FIRST SALE $4321.25.

COL. W. B. CARPENTER:
Dear Sir: As I was thinking of you and the Missouri Auction school in general I will drop you a few lines to let you know I am still on earth. I think I did very well for a new man. I have had 15 farm sales since I came home and all seem to be very well pleased. My first sale was a dandy—all good stuff and sold fine. It amounted to $4321.25. JOHN R. TRIGGS.
Valley Falls, Kans.

COL. W. B. CARPENTER,
Real Estate and Merchandise Sales.

These men, experts in their respective lines, each a well known, successful auctioneer, give our students personal instruction in the class room, and actual selling experience in the ring. The mere fact that they leave their own work to work in Missouri Auction School is a high compliment to the thoroughness of our course.

Next Term Commences Jan. 6, 1913

Arrange now to enroll in the January, 1913, class. This term is held just at a time most convenient for you—just between seasons. By enrolling in this term you not only get advantage of my **special proposition,** but you can get in your course at the school, receive your diploma, and get back home before spring work opens up. Remember—The Missouri Auction School is not an experiment. It has been in successful operation for the past seven years and during that time has turned out hundreds of successful auctioneers—many of whom are now making more clear money every year than the average country doctor, lawyer or merchant, yet they have nothing invested but their time. I would like to hear from you personally, and just as soon as I can, as I am now making arrangements for the coming term and as I personally see to the convenience and comfort of my students while in school it is of great assistance to me to know in advance approximately how many students I am to expect. As a special inducement for you to write immediately I will also send you, in addition to my big FREE 96 page illustrated catalogue, any one of these six books on Auctioneering by well known writers: "Burn Your Smoke," "20th Century Auctioneer and His Methods," "Opening Speeches for Public Sales," "What an Auctioneer Should Know," "He Who Sells" and "How to Get Business." Just write me a postal for the Big Free Catalogue and say which **one** of the six books you want. I will send both **free and prepaid.** The January, 1913 Term opens January 6. Four weeks of your time will make you a successful, competent auctioneer.

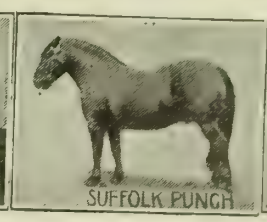
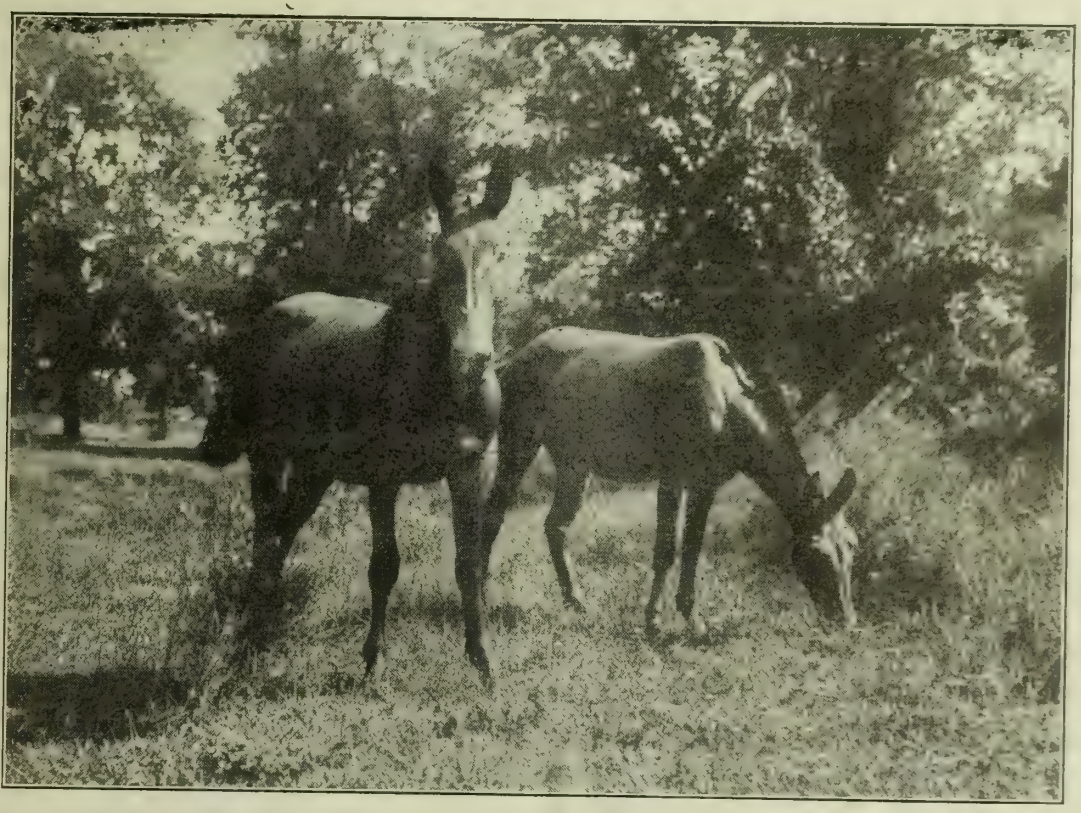
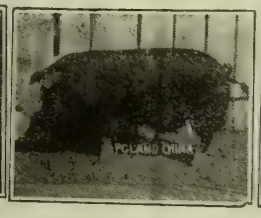
Volume V. *Kansas City, Missouri, December 20, 1912* *Number 23*







Hybrids Retard Horse Production

Good mule colts are selling for $125 each at weaning time. The growth of the mule industry in this country is marvelous. About one-fourth of the mares in the United States were bred to jacks this year. The average age of brood mares in the Southern half of the United States is about ten years. The leading question at the present time is, where will we get the brood mares in a few years if this is continued? The United States has more mules than can be found in the rest of the world. Every mule produced removes the chance of producing a brood mare.

Percherons and Belgians

Personally selected by me early in the season and

Imported From Best Studs of Europe

Young, Sound, Reliably Bred Stallions

good in size, bone, action and color. Every horse guaranteed and sold in condition for service. I work some of them in the harness every day. Among the Belgians is a magnificent seal brown grandson of the Brussels champion, Indigene de Fosteau.

Prices reasonable. Barn 4 blocks from Santa Fe depot.

W. H. RICHARDS, D. V. S., Emporia, Kas.

PARAMOUNT STOCK FARM

Imported and Home-Bred

PERCHERONS, BELGIANS AND SHIRES

My new importation of stallions and mares, which I personally selected, arrived last month. This importation, numbering over 40 head, comprises the best lot I ever imported, and with those already in my barns and pastures, makes Paramount Stock Farm one of the best places in America to come for strictly high class stallions and mares. Among them are prize winners and tops that cost a lot of money. Come to the farm, 2 miles north of Hudson, 9 miles southwest of Waterloo, and see them. Address, mentioning the American Breeder,

WM. CROWNOVER, Hudson, Blackhawk County, Ia.

TAYLOR & JONES

Williamsville, Sangamon Co., Ill.

Our new horses are now in the barns, and we have an extra good lot of Belgians, Percherons and Shires. We invite buyers to call and look them over. We buy the best we can buy, and if there were any better to be found we would handle them. Our guarantee is safe, and we can protect a buyer from loss for the full purchase price. Come and see us. It won't take long or cost much, and we feel sure we can save you some money.

The Percheron Society Affairs

Two Years' Review of the Conditions and Motives Which Have Affected This Record Association and the Attitude of the American Breeder Toward It.

After a careful investigation of all the facts in the case concerning fraudulent registrations in the Percheron Society of America, a campaign was started in March 1911, for clean pedigrees. Not a single soul outside of the American Breeder offices knew what was going to happen until the first article was published. There was no malice in this move. It was a fight for the integrity of a great breed and an important business. Fraudulent registration of animals had been laughed at and plainly talked about in public and yet not a living soul dared to say a word against it. It had been going on for several years. We started a campaign that we knew would cost us a small fortune. This campaign was a sensation among those interested in Percheon horses but one that has had its influence among breeders of the different clases of live stock where live stock is bred extensively.

Our aim was not to injure somebody or some business but to stop the fraudulent registration of horses. This we have accomplished to a degree that has been very satisfactory. Nearly every individual who opposed us in this campaign is now friendly because he realizes that the action we have taken has not only benefited him but it has put everybody on an equality. The writer recently visited sections where grade horses formerly were purchased for the purpose of converting them into pure breds. Nothing was heard concerning any more purchases for that purpose.

We believe that the value of that campaign waged by the American Breeder cannot be figured in dollars and cents. It has put the square deal in first place and has taken away from the young men an influence which was very disastrous. We consider the influence in this direction for the rising generation to be of more value than is any breed of live stock. It is these young men who soon are to assume control of our agricultural affairs and we sincerely hope that the influence around these young men will be such that their transactions will never be questioned.

We printed the truth fearlessly. We did not attack some small breeder whose operations were not extensive but we struck a hard blow at the head of these transactions, and it has given good results. An example has been set for all intelligent breeders that no one is immune to disgrace who follows such practices. The lesson we have given in this direction will go down in live stock history as the first and only case of its kind on record. Strong men held their breath when a publication appeared on the horizon that had the moral standing to attack this corruption.

It never has been our wish that a single animal should be removed from the records of the Percheon Society of America. Descendants of those that were questioned have passed into the hands of innocent purchasers to whom cancellation of registration would mean a great loss. And right here is a feature in the status of Percheron Society affairs that is not clear to all breeders. There is no man no matter how honest he may be, who could qualify to remove from the records a single individual and do justice to all; because he would not know where to stop. This may be a plain statement but it is the fact nevertheless. There is only one thing to do that we know of and that is to try to protect the present records, and from this time forward make them as clean as they can be made. Education is the best and the only absolutely fair means of eliminating the bad blood that has been brought into the breed through fraudulent registration.

Now as to the men who debauched the records of the Percheon Society of America. We have proven that they did this beyond any question of doubt. It will be up to the members of the association whether or not they shall retain officers who have been thus guilty of fraudulent registrations. It was our duty to give them the facts in the case and let the public be governed by its best judgment. In doing this we spent money by the thousands and devoted one year to the most difficult labor that any individual ever performed. We are not the guardian of any record association but we feel that the results obtained were worth the effort and sacrifice. We have placed around the rising generation of breeders an influence that will last for all time to come, and with a value not measured in money.

The trials and tribulations of that campaign would make an interesting book, at least all live stock breeders would be glad to see its contents regardless of price. We do not deem it necessary to make many statements concerning this proposition; all we wish to state is that we have done our duty fearlessly and proven beyond a question of doubt that publicity has great value from a moral standpoint when properly applied.

Those breeders who have reached the shady side of life do not realize how important it is to take a stand for cleaner business methods, even though one or more of their animals may be branded as mongrel in the end. We would like to ask the breeders of live stock whether it is more profitable for an individual to have a reputation as a clean man, and set an example for the rising generation, or to obtain a few dollars for animals of doubtful worth. These are questions that not only breeders of live stock must study but all human beings. We have been conservative in all we have printed pertaining to men, and especially those who have been guilty of fraudulent registrations, because the weal or woe of these particular men is a minor consideration.

At the Percheron Society election in 1911 an agreement was made between the two factions, those who believed in the American Breeder and those (some even honestly) who followed the men then in power. This paper was not a party to this compromise, but it was understood at that time that all parties concerned would cease fighting and all work to the best future interest of the Percheron Society of America. As a part of this compromise it was plainly understood that the president at that time should not be re-elected, but, to our surprise, reports of that meeting were printed plainly indicating that a great "white washing" had been delivered. Still we were willing to take the word of some of the leaders for it, that this was done merely to save the feelings of a man who was hard hit, and that the agreement would be carried out in good faith.

There has been some controversy during the last year. We still have remained neutral preferring to give them full time to make good. The officers perhaps have not had sufficient time to rectify all mistakes. The conservative plan in this case is much better as it requires a considerable effort and a great deal of labor with a large record association to get things in first class working condition. There is no question about some of the officers being in sympathy with better conditions. The secretary in his report has promised to have all the certificates published in stud book form in the near future; new stringent rules have been put into effect and considerable investigation of the right kind has been done.

If justice is done it is not for us to say who the officers shall be or try in any way to dictate the policy of this or any other record association. If there are any whom we have assailed who wish to lead a better life, the American Breeder will be the first to assist them. No honest man can say that the campaign which was waged against fraudulent registrations in the Percheron Society of America was for any purpose other than the best interests of those interested in Percheron horses.

When we first started this campaign we were accused of almost everything, but the principal argument was that the Percheron breed of horses would be ruined. Percherons registered in the Percheron Society of America are worth more per head today than they ever were in American history. Any record association that cannot withstand a house cleaning should not exist.

We should like to see these factions unite and all work together for the best interests of those engaged in using Percheron horses. There has been considerable feeling about the methods of electing officers in the Percheron Society that we believe could be eliminated very easily. One thing that would have a great tendency in this direction would be for the four directors whose term expires next December, to resign within the next few months and allow others engaged in this class of animal husbandry to occupy such positions. It is not necessary to give any specific reasons except that these parties have held these affices for many years, and if it is a labor, they should vacate and make room for others to perform a part of that service. If it is a pleasure it should not be monopolized by them from one generation to the next. We believe that if these parties are sincere in their devotion to the Percheron Society of America they will take this view of it and will consider a vacation seriously.

Percheron horses are exceedingly good property and we do not believe that any one need fear any good animal being removed from the Percheron Society records. This class of horses is the most popular in the world, judging from numbers. Occasionally we hear an individual speak of one or more animals, not being up to breeding standard in some respects. But this may be found in other classes of stock. If the breeders of Percheron horses unite and work for the advancement of their breed, much greater results can be obtained than from a factional warfare. Examples have been set that will make any individual think seriously before attempting to register a fraudulent animal, for the largest breeders in the land can be disgraced for life. This one example alone should be sufficient. Let us all work together for the advancement of the Percheron horse and its continued high value for better agriculture in America.

We Wish You All

A Merry Christmas

And for ourselves the pleasure and privilege of co-operating with you for another good and

Happy New Year

THE MORAL SIDE OF A BREEDER'S LIFE.

The following article, from the Kansas City Star of December 21, describing an occurrence during an evening session of the Graham Scientific Breeding School, brings out a point we have made many times before, viz.: That the successful breed-

ers of this country must necessarily be men whose minds and hearts are right. The moral tone of a school of instruction holding the patronage of such people could not be otherwise than good.

Here is the way the Kansas City Star told about it:

Public opinion, which has a low estimate of the moral side of horsemen, is due for a revision. The real horsemen of the country, those who produce the big drafter, the thoroughbred, the high speed harness horse and the gaited animals, have high moral ideas, and not only believe in them but live them.

A practical demonstration along this line was supplied Wednesday night in a room on the third floor of the Williamson Building, on West Twelfth Street, where fifty men from seventeen different states of this country, and one from Belgium and England, were listening to F. B. Graham deliver one of a series of lectures prescribed in the course of Graham's Scientific Breeding School.

Mr. Graham had delivered two preceding lectures that day, in which he urged horsemen to high moral conduct and right living. At the night meeting this subject was enlarged upon, and with the usual quickness which characterizes all volunteer movements, it became a regular revival meeting. One man prayed, another gave an impromptu talk, and four men, who said they had not attended church for years, declared they had been converted.

According to W. H. Hanna of Tontogany, O.; J. W. Shockley, Ewing, Ky., and J. V. Painter, Middleton, Ind., this is the way the meeting turned to the religious side. Mr. Hanna said:

"We had heard Mr. Graham's lecture on cleanliness with horses, how to keep the barns in good repair and treat the animals with love.

"He said a good, moral man could manage horses better than one who was ill-tempered and profane. Taking his lead I began to talk and then pray, neither of which I had done in public before, and then the meeting became a general outburst of enthusiasm. I never witnessed anything like it before. I know each one of the men there will live a better life."

J. W. Shockley, a breeder of thoroughbreds of Ewing, Ky., said, "The old idea that a horseman must wear fancy clothes, gaudy jewelry and red neckties, and be of a low moral type is not correct. What I saw and felt Wednesday night convinces me that horsemen are more religious than they are given credit for."

FEEDING HORSES IN RUSSIA.

"Oats constitute three-fourths of the food upon which the Russian horse must exist during the twelve months of the year," says Consul General John H. Snodgrass in a report from Moscow. "Russian oats, however, are far superior in sustaining power to the American cereal. It is also claimed that animals do not become so tired of this steady diet as they do of the hay and corn products in the United States. This statement is made by an American of eighteen years' experience in horse breeding and training in Russia.

"Among the upper classes twelve or fourteen pounds of hay are fed daily to the carriage and race horses, in addition to the 20 quarts of oats that are thought necessary for a horse during the 24 hours. This hay consists principally of timothy, in Finland and the central and southern portions of Russia. In many other sections owners of horses must be content with the native marsh grass, which resembles the American prairie grasses. On the uplands, however, a good quality of grass is grown which resembles Kentucky blue grass.

"As a result of a light hay diet, Russian horses are remarkably free from the heaves, though a more serious trouble originates from a continuous diet of oats; namely, cracked skins and heels, with open pores. A well known horseman says that he has many times seen blood oozing from the skin and heels of horses without any apparent cause, though an investigation always proved that a steady diet of oats was to blame. The same person stated that he had experimented upon horses afflicted with the disease, and that, after a few weeks of proper feeding the sores and cracks disappeared and the animals improved in every way, especially in appetite and endurance.

"City horses never taste a spear of green grass, but appear to keep in fairly good condition with practically no attention from the grooms. They occasionally are fed carrots, but this does not apply to the average work horse, driven at all times of day and night and subjected to Russian winters. His endurance is one of the marvels of the country.

"The feeding of corn, mixed foods or prepared diets is unknown in Russia except among the racing fraternity, who have adopted American ideas from the trainers brought over years ago from the United States. The race horse in Moscow, for example, has a variety of diets, according to the work they are doing, and the American suggestion of a Saturday evening hot bran mash has been adopted, with the usual good results. They are also given ground or cracked cereals, bran mixed with oats, chopped hay and oats, and the usual spring treatment for appetite and improvemnt of the blood."

THIS YEAR'S FEED PRODUCTION.

A field half as large again as Italy or nearly as large as either France or Germany is the area of this country's cornfield, says the recently issued report of the secretary of agriculture. This year's corn crop is the largest ever produced in this country, and reaches the staggering amount of 3,169,000,000 bushels. In value, too, the corn crop of this year is the highest on record, and reaches the fabulous amount of $1,759,000,000. This crop is worth to the farmer 20 per cent more than the average corn crop of the previous five years.

Hay has returned to its old place and is the crop that is second in value. The year was most productive for grass and hay, and the harvest of hay is measured by 72,425,000 tons. This is 16 per cent above the average crop of the previous five years. The value of this year's hay crop is $861,000,000, and has never been equaled. It exceeds the five years average by 21 per cent. The importance of this crop to the farmer is better realized when it is observed that its value is greater than that of the cotton crop and nearly as great as the combined values of the wheat, tobacco and potato crops.

The wheat crop is estimated to be worth $596,000,000, an amount which was exceeded by the value of the crops of 1909 and 1908, but no other year. The quantity of the crop, 720,333,000 bushels, is 11.2 per cent greater than the average production of the previous five years and has been exceeded by the crops of only two years. It is only 15,000,000 bushels below the next higher crop and only 28,000,000 bushels below the highest production.

The oats crop is fifth in order of value. Although the price has declined, the production is so enormous that the value of the crop is estimated to be $478,000,000, or a little more than one-half the value of the entire cotton crop. The remarkable production of 1,417,172,000 bushels was 51.5 per cent greater than the average of the preceding five years.

The seed out of the cotton crop of this year is estimated to be worth about $117,000,000, or over 6 per cent more than the five-year average, but its value has been exceeded by the crops of three preceding years. The combined value of the cotton lint and seed is estimated to be $860,000,000, or about one-half of the value of the corn crop and a little less than the value of the hay crop. In value as well as in production the cotton crop of this year has been exceeded by only one year, and that was 1911 for production and 1910 for value.

The year 1912 was a record-breaking one for corp production and crop values. Only two crops had been exceeded twice in former production, and these are wheat and tobacco. Only two crops had been exceeded once in production, and these are cotton and rice. All of the other crops stand at high water mark—all of the cereals but wheat and rice, the great hay crop, potatoes, flaxseed and beet sugar.

SCIENTIFIC BREEDING SCHOOL.

One of the most successful terms of the Graham Scientific Breeding School ever held has just closed. This is evidence that the American breeders are in full sympathy with this work. A great many letters have been received asking for one more term. Another term will be held January 13 to 18. All breeders who expect to be in attendance should arrange to attend the January term. There will be very little excuse for anyone not attending at that time, as the winter farm work will be completed generally.

Several breeders have written the school stating that their wives were not favorable to this institution. The reason they are not favorable to a school of this kind is because they do not understand its mission. If an individual can double the income from his stock without increasing the investment, the wife should be in full accord with such a move. There are other features to this school that should please every wife. Subjects are discussed plainly that mean much for the general welfare of all families; a higher standard of life should be the result of education along certain lines. If more men could hear some of these lectures there would be a less death rate from the so-called Bright's disease. This applies to women as well as men. One lecture delivered by Frank B. Graham on certain diseases is worth the tuition and expenses for any student. It is remarkable how many individuals seal their own death warrants through the lack of certain knowledge. Perhaps more information has been accumulated through human specialists on certain breeding subjects than from any other source. Millions of dollars has been spent on these investigations.

Students from as far south as Louisiana, east to Belgium, north to the Canadian line and west to the Pacific coast were in attendance. Every student present pledged himself to be of as much assistance in promoting the growth and development of the Scientific Breeding School as he could. The Graham Scientific Breeding School is one of the best and most useful institutions in America; it not only assists the breeders in a financial way but has more influence in better citizenship. Several new features will be added at the next term of school which will make it one of the most complete ever held.

KANSAS HORSE BREEDERS' MEETING.

The Kansas Horse Breeders' Association will hold its annual meeting at the Agricultural college, Manhattan, Kas., Jan. 2 and 3, 1913. Secretary C. W. Campbell writes that it is to be the best and most interesting horse breeders' meeting ever held in Kansas. Some of the most successful horsemen of the country will appear on the program with men who are particularly well informed on horse breeding and horse improvement work.

Racing horses to the value of $160,000 sailed for Europe recently from New York. The shipment consisted of seven head, six of which James R. Keene has just sold to William K. Vanderbilt, Jr., and the seventh, the famous Peter Pan, which, it was reported, despite Mr. Keene's denial, he has sold for $100,000 to George Gould. The six horses purchased by Mr. Vanderbilt are: Maskette, Mosquito, Early and Often, Courtdress, Ortwells and Oceanbound.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

LACERATED PERINEUM—Is a mare lacerated and torn at time of parturition between vulva and rectum broken through, likely to get with foal? And would there be any risk of further damage being done at time of foaling?—Colorado Subscriber.

REPLY—A laceration in this region need not prevent a mare from breeding, but there may be trouble encountered at the time of foaling through the colt directing a foot through the rent and in that way completing the laceration.

ABORTION—There is quite a lot of trouble in our county with our best mares that are well cared for, losing their colts. What is the cause, and how would you correct it? Is well cured sorghum hay liable to cause abortion?—Texas Subscriber.

REPLY—Usually at this period of the season and later complaints come to us relative to mares foaling prematurely or aborting. The great majority of cases of abortion are of an infectious character, as shown by the generel tendency to affect several pregnant mares in a herd or community. Some cases of abortion are a sequel of some disease of an infectious nature, as illustrated by the disease, influenza. It is a noticeable fact when influenza is prevalent in a locality that many affected pregnant mares abort. Aside from those cases that arise as a result of some febrile disease are the few isolated cases that result from accident or great mental disturbance.

The control of an outbreak of infectious abortion in a herd of mares where it has already gained some headway is not easy. The general rules of sanitation must be scrupulously followed and with the thought that it may not only be carried to healthy stock through association with a diseased subject, but by attendants as well, one should exercise the greatest of care in preventing contamination in this way. As soon as a mare has aborted from any cause she should be promptly isolated from the sound stock and a thorough cleansing and disinfection of the particular spot and surroundings should be made. The party participating in this work should continue his care and under no circumstances should go into the presence of the remainder of the herd. It has been repeatedly demonstrated that this disease may be carried on the shoes and clothing of the attendant and in this way promote its spread. The only way that one can cope with and control these outbreaks is in the way of prevention. Medical agents are very unsatisfactory and should not be depended on.

A FRETFUL MARE OWNER—A bred his mare to my horse; came back to rebreed; another mare ahead of him; was asked to wait until 9 o'clock; A got mad and went to another horse because he was not immediately served. Bred the same day to the other horse. A refuses to pay me for colt and paid the other horse. Can I collect insurance.—Ohio Subscriber.

REPLY—You can sue the owner of this mare and collect the service fee unless he is able to prove, beyond a question of a doubt, that your horse is not the sire of the colt. This he cannot do, but it might cost you more than the service fee to collect it, in addition to losing future patronage.

You might well be satisfied that you have lost such a customer. The owner of every good stallion should make up his mind that he is running his own business. This may be averse to the decision of a few fretful mare owners but it usually gives better results in the end.

WORN-OUT MARES—I am offered ten mares at a very reasonable price as they are "pavement sore"; they range in age from 12 to 18 years of age; none of these mares have ever been bred. What percentage would likely come in foal if bred to a good jack, using the capsule system? Would it pay to purchase them? They are in good shape physically, barring a slight "pavement soreness."—New Jersey Subscriber.

REPLY—We would not advise the purchase of these mares. Occasionally a purchase of this kind is very successful, but usually a poor percentage of foals is the result. During the last few years mares have been at a premium on farms, and the majority of mares found in the large cities have been sold because they were not producers. The fact that these mares have not produced colts is evidence that the generative organs are not in a productive condition, owing to the long period of rest, but if these mares are purchased a better result can be had with capsules, properly handled, than with the natural service.

CHANGING GAITS—I have a pacing stallion colt coming 3 years old; is a natural pacer until I had him shod and now he will trot in harness; no trouble to change him. Will he be as fast to let him travel both gaits?—Arkansas Subscriber.

REPLY—There is only one way to know which gait will be the faster, and that is after being tried. If in your opinion he would be much faster at the pace than the trot, it would be advisable to continue him as a pacer, but a trotting horse is worth more money where the speed is equal or nearly so. Pacers, unless very rapid, are not in demand.

STALLION GUARANTEE—A has a public sale of stallions and mares; sells stallion of breeding age to B; A represents him to be an average breeder; B gets less than 25 per cent of mares with foal. Is less than 25 per cent an average breeder? If not, should A make the difference between a 20 per cent breeder and an average one? or could he be made to pay the difference?—Iowa Subscriber.

REPLY—If the stallion in question has produced 20 per cent of foals from all mares bred, we are inclined to believe that the difficulty is with his management and not with the horse. We would advise giving this stallion another chance in the hands of a competent caretaker. The seller of this individual will probably be glad to extend the guarantee another year. This stallion is discharging live spermatozoa at some services and would probably be an average foal getter if properly handled. A few diseased mares can greatly diminish the percentage of foals in a community.

SHY BREEDING STALLION—I purchased a horse in Assumption, Ill.; American bred; owner claimed he had served 85 mares in 1911 and 80 in 1912; that he had foaled 50 per cent in 1911 and should have done better but for a good many mares coming from a distance and not being returned. He had the run of a yard at night and a box stall in daytime; was thin; ribs just covered; I did not get any breeding guarantee, as any guarantee I have seen is not worth much. In a letter to me he stated he was a good average breeder. I will tell you how he acts. The stallion is 8 years old; thin in flesh, not poor; feeding and feeling good; will draw as soon as the bridle is put on and keen to get to mare; will mount and enter a few inches, then stop and remain quiet for a short time and then come off still ready; would mount again immediately if allowed; have tried him repeatedly and acts about the same; never works any after entering and never spends. What are the chances of his coming right, and is there anything I could do for him?—Manitoba Subscriber.

REPLY—If the seller of this horse is financially fixed so that a judgment against him can be collected, you can bring suit and recover damages, unless the statement he has made to you is correct. This horse is not an average breeder and it is quite likely that he has been tried before. We would advise you to ship the

(Continued on page 13.)

Recent Draft Horse Sales

Healthy Demand and Widespread Interest Shown. Good Averages But Few Extreme Prices. More Farmers Buying Mares and Fillies. Highest Quality Appreciated.

The December series of draft horse sales opened on the 10th with the Percheron sale of W. S. Corsa, recognized as the most important of the several events. All the sales advertised in the American Breeder have been successful—the prices giving good encouragement for the breeders and importers who put up desirable stock, and yet not on a level high enough to bar out even those of moderate means who are in position to make good use of the class of animals offered.

The Corsa sale, held at Gregory Farm, White Hall, Ill., was of course a Carnot event, the prize winning sons and daughters of this champion sire being the prime attractions. The first ten head of Carnot colts to be sold (all weanlings or yearlings) brought $9,350. This, with the Carnot colt sold a year ago at $1,000, brought the total for first ten colts sold up to a figure which pays the purchase price and keep of this $10,000 champion sire. The top of the sale was $1,835, paid for the Carnot yearling, Carlant. The average on the stallions (four yearlings and one weanling) was nearly $875, and on the mares and fillies $675.50, the whole offering of thirty-five head averaging nearly $720. Following is a list of the sales:

Stallions.

Carlant, 1 year, by Carnot—J. C. Luellen, Ashley, O.	$1,835
Carbon, black, 1 year, by Carnot—O. H. Scantland, Williamsburg, Ind.	1,200
Sigurd, 1 year, by Carnot—Dr. J. C. Hand, White Hall, Ill.	630
Carchepie, weanling, by Carnot—McNamara & Martin, Big Sandy, Mont.	525
Micarnot, 1 year, by Carnot—J. C. Drewry, Cowley, Alberta	550

Mares and Fillies.

Lottano, 1 year, by Carnot—Pabst Stock Farm, Oconomowoc, Wis.	1,200
Folito, 1 year, by Carnot—Pabst Stock Farm	1,000
Empreto, 1 year, by Carnot—J. C. Drewry	875
Canito, 1 year—McNamara & Martin, Big Sandy, Mont.	720
Hymneto, by Carnot—McNamara & Martin	700
Huchette (imp.) 5 years—W. S. Letts, Columbus Junction, Ia.	900
Hausse Queue (imp.), 5 years—T. A. Shepard, Pawnee, Ill.	525
Vernette, 5 years—A. E. Knight, White Hall, Ill.	830
Rosemary, 5 years—Edgar Baker, White Hall, Ill.	460
Eskridge Belle, 5 years—Scandrett Bros., Rock Bridge, Ill.	575
Mollie May, 6 years—E. L. Culver, King City, Mo.	900
Biribie (imp.), 9 years—T. A. Shepard	590
Impatiente (imp.)—J. C. Drewry	655
Peggy, 4 years—G. B. Helmuth, Millersburg, Ohio	850
Lucita, 4 years—E. R. Shaw, Oneida, Ill.	725
Minetta, 3 years—Edgar Bager.	350
Suzanne, 5 years—J. C. Drewry.	750
Cantino, 2 years—J. A. Gifford, Beloit, Kas.	600
Minerva, 5 years—J. C. Drewry.	740
Impassible (imp.), 4 years—W. C. Neeley, Seward, Ill.	675
Palmetta, 3 years—E. R. Shaw.	560
Idya (imp.), 3 years—W. C. Neeley	525
Bonnie of Richland 3d, 2 years—A. W. Graham, Carrollton, Ill.	625
Fairy, 2 years—McNamara & Martin	580
Archon, 2 years—E. R. Shaw.	625
Bonnie of Richland 2d, 6 years—J. C. Drewry	565
Merdit, 2 years—C. E. Davis, Jacksonville, Ill.	630
Marie, 2 years—T. A. Shepard.	700
Marie, 2 years—R. N. Thompson, Cowden, Ill.	315
Mertant, 2 years—McNamara & Martin	625

The Sale of J. H. Decker.

The Percheron sale of J. H. Decker held at Piper City, Ill., on the 12th, made an average of $488.50, the stallions averaging $609 and the females $455. The top of the sale was $1,495, paid for Junior, a double great grandson of Bisique. The buying by Mr. Decker's own neighbors was a credit both to him and the community. Following is a list of representative sales:

Stallions.

Junior, 3 years—Kewley, Piper Piper City, Ill	$1,495
Juste, 3 years—J. B. Dougherty, Piper City, Ill.	1,000
Prunes, 3 years—H. T. Brown, Lexington, Ill.	365
Junior 2d, weanling—M. Kilbury, Piper City, Ill	185
Roscoe, 2 years—H. T. Brown.	285
Roler, 2 years—Finch Bros., Joliet, Ill.	435
Victor, 2 years—Robert Trett, Watseka, Ill.	580

Mares and Fillies.

Italie' (imp.), 4 years—H. G. Althoff, Tentopolis, Ill.	600
Kravate (imp.), 2 years—Sam Stadler, Roberts, Ill.	445
Koupole (imp.), 2 years—J. A. Wade, Griggsville, Ill.	445
Karonie (imp.), 2 years—P. H. Doran, Piper City, Ill.	370
Koncorde (imp.), 2 years—P. H. Doran	460
Jablines (imp.), 3 years—J. C. Heins, Chenoa, Ill.	510
Kostroma (imp.), 2 years—M. L. Brown, Greenville, Ohio.	480
Kerazonde (imp.), 2 years—S. Lacey, Farina, Ill.	405
Kella (imp.), 2 years—S. D. Hevener, Piper City, Ill.	500
Katinka (imp.), 2 years—Thos. Doran, Piper City, Ill.	335
Kapota (imp.), 2 years—Thos. Cooper, Canton, Ill.	450
Jaseuse (imp.), 3 years—F. W. Schwab Lexington, Ill.	450
Katalepsie (imp.), 2 years—R. S. Bradbury, Roberts, Ill.	540
Kousine (imp.), 2 years—C. O. Neele, Manteno, Ill.	475
Jasminee (imp.), 3 years—E. Kemp, Kempton, Ill.	530
Japonerie (imp.), 3 years—E. Kemp	530
Jusee (imp.), 3 years—F. W. Schwab	500
Jacquine (imp.), 4 years—E. W. Downs, Cabery, Ill.	390
Mabel, 2 years—J. A. Wade.	395
Lucille, 6 years—J. E. McBride, Rutland, Ill.	600
Gladys, 5 years—J. E. McBride.	600
Cora M., 4 years—Fred Roche, Chatsworth, Ill.	700
Nettie, 5 years—S. Lacy.	500
Mabel, 1 year—K. C. Bute, Kempton, Ill.	265
Roby, 1 year—K. C. Bute.	265
Jeannette, weanling—W. Kuffner, Chatsworth, Ill.	200

The Sale of Lee Brothers.

Lee Bros., Harveyville, Kas., held their first annual sale of Percherons at Manhattan, Kas., in the new judging pavilion of the Agricultural College. They had a fine attendance of breeders and a good sale, totaling close to $20,000 for the forty-eight head sold, eight of which were French Draft, and many of which were youngsters, as our list shows. Some of the show stock sold early went below its value, but these bargains encouraged better bidding later with a satisfactory total as the result, and a lot of good friends won for future sales.

The Percherons averaged $417.25, with a top of only $950, paid for the two-year-old show stallion, De Coseline. We list below the Percherons:

Stallions.

De Coseline, 2 years—Ernest Gregor, Goodland, Kas.	$950
Carno, 2 years—E. T. McLean, Elmo, Kas.	905
Intime, 1 year—John G. Barr, Westmoreland, Kas.	330
Silver Tip	410
Arthus, 2 years—Elias Tully, Manhattan, Kas.	365
Carlo, 2 years—Frank Prachar.	390
Kelso, 4 years—J. C. Robison, Towanda, Kas.	695
Cyril, 2 years—Sam Weichselbaum, Ogden, Kas.	305
Brilliant Le Perche, 2 years—Jno. G. Barr	480
Casine, 1 year—J. M. Beach.	210
Stallion weanling—P. A. Johnson, Riley, Kas.	200
Stallion, 1 year—Kansas State Agricultural College	415

Mares and Fillies.

Galette, 6 years—Ed Nicholson, Leonardville, Kas.	825
Allie, 5 years—H. H. Bordene, Bedford, Ia.	760
Jocaste, 3 years—Ed Nicholson.	630
Fernice, 2 years—A. F. Myers, Perry, Kas.	395
Calla, 10 years—Ed Nicholson.	300
Lee Bell, 1 year—A. F. Myers.	250
Evelin, 1 year—A. F. Myers.	250
Gaudine, 6 years—Ed Nicholson.	600
Madge, 2 years—Ed Schroer, Manhattan, Kas.	350
Nellie, 7 years—C. W. Lamer, Salina, Kas.	300
Rose, 2 years—B. Dall, Webber, Kas.	520
Irine, 2 years—W. H. Rhodes, Manhattan, Kas.	465
Moley, 12 years—Ed Nicholson.	250
Faunita Bell, yearling—Ed Nicholson	300
Almedia, 4 years—Ed Nicholson.	475
Zenobia, 2 years—J. F. Rhodes, Tampa, Kas.	500
Flossie, 2 years—H. H. Bordene.	425
Juliette, 8 years—J. W. Mochle, Clay Center, Kas.	380
Bell Napp, 4 years—J. F. Rhodes	490
Kate, 2 years—W. W. Stegeman, Hope, Kas.	225
Nettie, 2 years—E. H. Schroer.	320
Della, 1 year—Means & Sons, Burlingame, Kas.	540
Thelma, 1 year—Frank Prachar, Goodnight, Tex.	290
Primrose, 2 years—Chas. Gramese, Perry, Kas.	425
Weanling—Kansas State Agricultural College, Manhattan, Kas.	200

CALL TO KANSAS BREEDERS.

To the American Breeder: We want to remind every stallion owner and horse breeder through your columns, that it is to his interest to be at Manhattan, Kas., January 2 and 3, to attend the annual meeting of the Kansas Horse Breeders Association. If we are to get a provision in the Kansas law (such has been suggested by the American Breeder) for the protection of stallion and jack owners and honest mare owners as well, steps must be taken at this meeting. It is the best possible plan for taking united action. Let every breeder be there.

DR. W. B. RICHARDS, Lyon County, Kas.
J. C. ROBISON, Butler County, Kas.
C. W. LAMER, Saline County, Kas.
LEE BROS., Wabaunsee County, Kas.

A HORSE PLAGUE IN 1872.

Forty years ago this country suffered from a disorder of horses far more serious by far than the "horse plague" of the plains sections last summer. The daily papers have recalled it, in stories of the time forty years ago, when a team of horses for drawing the hearse could not be secured for a Kansas City funeral.

"It was the year of the 'epizootic,'" says the Kansas City Star. "Horses everywhere fell victim to horse lagrippe and sufficient healthy horses could not be found in Kansas City to draw a single hearse. Even mules were scarce, but those that could be spared from the plow or transfer wagons were pressed into service and out of respect to the subject of the occasion the mourners walked.

"The malady had its beginning in New England and swept West as far as horses went, striking Kansas City forty years ago on a Saturday. By the following Monday every horse in Kansas City was out of use. Most of them were down and those not badly afflicted were not presentable for a funeral occasion by reason of having their legs bound with gunny sacks, crazy quilt and anything that would keep them from catching further cold.

"Popular as the mule always has been in Missouri, it even then was considered a mark of disrespect to the dead to have hearses hauled by mules. However, nothing else was to be done."

JACK TREATMENT WANTED.

To the American Breeder: Will some one of the readers of the American Breeder give me (through these columns) a treatment for sores on my jack's legs? The sores are on the front of both hocks; have been sore about eighteen months. I have been reading the Breeder only about six months and like it very much; read it as soon as I get it. Thanking every one in advance for a treatment.—J. J. Smallwood, Douglas County, Mo.

STALLION CASH GUARANTEE.

In order to attract the attention of individuals who are expecting something for nothing, unscrupulous dealers advertise impossibilities. It is an impossibility for an individual to engage in the business of selling stallions to the public, with a guarantee that in case the stallion is not a satisfactory foal getter, he may be returned and the full purchase price will be refunded. If there was not a protecting provision in this guarantee a large number of these stallions would be returned in a dilapidated condition. If an unqualified cash guarantee was rigidly enforced it would put any firm out of business in a very short time. There are men who purchase stallions who can not make a success of the stallion business. If the "cash guarantee" could be enforced a lot of men could buy stallions, keep them a season and return them. In other words, they would "borrow" said stallions for a limited time. This sort of business would place on the market a lot of stallions that had been used by inexperienced men. And in many cases, injured. It would soon become a question of taking chances on buying a stallion from a firm that made a practice of loaning its stallions out indiscriminately. Who would care to buy one of these stallions after it had been in the hands of several novices?

But this is not the great difficulty. While stallions may have been taken back under perfectly satisfactory conditions in some cases, the "stallion cash guarantee" is used as a drawing card for the purpose of catching "suckers." There are only two firms that we know of that are offering to make the cash guarantee. One of these firms is new in the business; the other is occasionally spoken of as the "crookedest man in the draft horse business in the United States." One of the associations with which he recorded animals has even sent out notices that it would not register American bred animals for him.

A cash guarantee can be so prepared that the purchaser can not return the stallion and get the cash. These firms have made transactions that are not satisfactory. The American Breeder will not sell them advertising space at any price. These firms, however, are not the only draft horse advertisers that can not purchase advertising space in the American Breeder. There are a few other firms that for equally good reasons we do not want represented in the columns of this publication. Our readers' interests are best served by not carrying those firms of whose unsatisfactory business dealings we are in a position to know. The business of some of the larger firms, that spend their money freely, would be very profitable in a financial way, but we can not afford to sacrifice our readers—it is the readers of a publication that must be protected. Crooked pedigrees, bad guarantees and fraudulent transactions can not be beneficial to the best interests of the horse breeding industry.

We believe that any of our regular advertisers will make their guarantee good; if they do not do so after a reasonable length of time the American Breeder would like to have a complete history of the case. We have a method of enforcing these guarantees that has never been equaled elsewhere—the remedy is publicity.

A subscriber writes us stating that a stockman of his state, who is interested in draft horses, and who is an extensive advertiser, is very antagonistic toward the American Breeder. Is it any wonder that this individual does not like the American Breeder when he can not buy advertising space in it at any price? There is plenty of money in the draft horse business when it is handled on the square. All crooks should be eliminated. It is up to the buying public to eliminate them. If they are not patronized they will go out of business.

SACRIFICING SUCCESSFUL SIRES.

In the production of improved live stock there is one class of loss which should be considered seriously. A great many of the prominent sires are being sacrificed, or so placed that they are not being used to the best advantage. This does not apply merely to one class of stock, but to practically all of them.

A prominent student of select sires recently said that there were as many successful sires sacrificed each year as were produced. If this statement is true it should be remedied soon. It is a known fact that in nearly all breeds of live stock there are only a few outstanding sires. There is only one absolutely sure way to know a good sire, and that is by his off-spring. A great many of our best individuals are sacrificed because the owner does not really know the value of a good sire. This can only be remedied by more thorough and general education as to the real market requirements of the different classes and breeds.

Too many breeders sacrifice a successful sire for a young thing that has never produced, just to save themselves the expense of keeping an extra male or possibly because the pedigree is extended to some great ancestor. But the best pedigree for a sire is to produce the highest excellence in his produce. As a whole there are individuals that produce a few good ones and many of the inferior kind. Practically every pure bred breeder who has become a factor in his given class of live stock can attribute the greater portion of his success to some one particular sire. In a few cases the maternal side may be credited with the best results. Breeders who pay more attention to the method of selecting sires, and use as their criterion the successful breeders, are not usually quick to place a young thing which has never been tried, at the head of the herd. Some of our most successful breeders use their young sires lightly for several years to see what they can do, before using them extensively in their herds.

The selection of a sire for pure bred stock is some different from choosing animals which are used for public service, as the successful breeder of pure bred live stock must strive to increase the quality in the produce of each succeeding generation. This can only be done through a careful study and test of the best breeding material. Some of the very best prospects have been failures and have caused their owners a great loss of money.

There is, however, always one thought to consider in purchasing an old sire, regardless of his past success. He may have been used to an excess and not be potent. In purchasing an animal of this kind the microscope should always be used to test the semen. It is not necessary to try a sire in the natural way as sterility is very easily diagnosed with the miscroscope. Doing this will prevent business complications later on.

IN STORMY WEATHER.

Fresh air, exercise, sunshine, plenty of water, with a well balanced ration, is good provision for most live stock during good weather. During storms or wintry weather all stock should have a sufficient shelter. The shelter should be so provided that an ill tempered animal can not do serious injury to others of the herd.

In most sections of the country a satisfactory shed can be erected to a very good advantage with the sort of material which would be cheapest in that section. It is hard to calculate the exact loss of live stock during these times of high prices of both feed and stock by not having proper shelter. The thoughtful caretaker will put in more time caring for the minor details of a herd during a bad spell of weather than at any other time. If an animal is allowed to suffer owing to the intensity of the weather the result is not the actual loss of flesh to the animal at that particular time, but its mucous membranes become weakened so that the animal becomes more susceptible to infectious diseases, which may be present.

Stock running at large, with an open shed for protection, are much more immune to the infectious diseases than those kept in closed quarters. Fresh air, sunshine and exercise are cheap and very necessary in live stock production. But with these things must be associated a good shelter, plenty of water at all times and a well balanced ration of a nutritious character suitable for the given stock.

STALLIONS OUT OF SEASON.

At this particular time we are of the opinion that many valuable sires have gone into their winter quarters, which probably consists of a little box stall ten feet square, without even any fresh air. We have mentioned this fact before, but it is of such importance that we deem it necessary to call attention to it again. A two-acre lot, fenced stallion tight, with a small barn on the north side of it where the stallion can run in and out of it at his leisure, is not very expensive and means much to the future usefulness of either a stallion or jack. This is the best method of handling this class of stock, unless there is a way for the stallion to be used at moderate work by a competent caretaker.

Next spring stallions or jacks will be taken from their dungeons and expected to give a record-breaking account of themselves for at least ten weeks during the busy season. Many of them are encouraged to form bad habits, or may get vicious and hard to handle. One of the important things is that if a stallion has a large enclosure to occupy regularly the chances for sickness are greatly diminished.

Remember what we have frequently said about infectious diseases being more common with stock kept in a tight enclosure. This should appeal especially to stallion and jack owners. Usually all of the infectious diseases in a community are brought into close contact with the sire sometime during the year. Keep these particular individuals in excellent condition so that the mucous membranes will always be healthy.

THE PENALTY ON IMPROVED LIVE STOCK.

We often wonder if the general public appreciates the efforts of those engaged in the production of better breeding stock. There are many at the present time complaining about the cost of high living, but how often do we find individuals commenting on the increased production and other good results brought about by those who have spent their lives in the interest of better stock. Is the general public interested in these efforts or are the people engaged in non-productive pursuits, short-sighted and trying to injure the "goose that laid the golden egg?"

Most of us remember when land was cheap and the inhabitants were not so numerous, but this small body of land is surrounded by water and the greater portion is now owned and considered valuable. The free range is a thing of the past. The farm land is increasing in value as the inhabitants increase. Better stock is the only stock that is profitable anywhere. Instead of encouraging the breeders to continue in the production of the only kind of live stock that will meet the demand of present conditions, we find that even our laws are averse to the expansion of better breeding methods. If a fine stallion is shipped on the railroad he is rated at 3,000 pounds regardless of his actual weight. In Canada and other countries all recognized registered live stock is shipped at half price.

In this country a fine bull cannot, as a rule, be shipped from one state to another without the tuberculin test. Scrub cattle of all classes are being shipped as feederes everywhere without any restrictions, but the burden is put on the pure bred.

When the assessor comes to make a rating as to the value of purebred stock it is usually several times higher than the common stock. Just because those interested in improved stock have bred from and produced superior animals, and have tried to keep a record of the ancestors for breeding purposes, they are assessed higher.

Why do these conditions exist? Are those who make the laws in favor of a degeneration in quality? Or is it because these breeders are supposed to have plenty of money? Frequently a neighbor is jealous of those who have improved live stock. If the general public would study these conditions more carefully, less criticism would be passed upon those who are capable of producing excellent individuals.

No intelligent man can say truthfully that improved live stock is not a necessity in this age. Every market recognizes quality. The most important thing in live stock husbandry today is education. The few papers that have stood for better principles and better breeding methods should be commended. The live stock industry as a whole recognizes the great value of our agricultural colleges. At these institutions the young men are taught to adhere to a standard of excellence fearlessly. The instructors are not afraid to express their opinion, as a rule, for they do not depend on advertising; they are paid a salary for doing their duty. But the American people need some more assistance, especially when they stop to consider the great per cent of live

stock that is produced on American soil at an actual loss.

The quickest method of reducing the high cost of living is to produce a higher quality so that each animal will net a profit. It is not profitable to keep live stock for the soil fertility alone, but without live stock the improvement of the soil would be very slow indeed.

UNSOUND HORSES.

The question of transmitting weaknesses from sire to progeny is an important question for breeders to consider. Eighteen states have laws concerning this subject; others are being contemplated in the very near future by those interested. In one state 700 stallions have been examined and pronounced sound, according to the law in that state. The public has been advised that it is perfectly safe to use these sires so far as unsoundness is concerned. In this particular state these stallions will be examined again soon. Some of them will have acquired blemishes and be removed from further service. What will the mare owners say when they find that stallions which they have been patronizing are barred from further service owing to being unsound? Will this assist in establishing confidence in hereditary weaknesses? What will the horse breeders in that state say to those individuals who have advertised the fact that these stallions would not transmit unsoundnesses?

The important questions of the day are, who is capable of inspecting stallions? When does a sire become immune to transmitting certain weaknesses? Is it not largely in the conformation? Some sires may have a serious weakness, yet be handled in such a manner that the animal would not develop a blemish. On the other hand the strongest point in a sire may be deranged if the strain on it is severe enough. It is generally understood that a weakened condition of any part is usually the result of a natural weakness. As a rule, sires do not transmit blemishes directly, but they do frequently transmit certain weaknesses so that the particular weakness may give away under a moderate strain.

Weaknesses in live stock breeding is an important subject, and every one interested in live stock should study the extent of it. It seems to us that this would be an excellent subject for those in charge of the extension work of the different agricultural colleges to keep constantly before the American farmers. This kind of education will be lasting, for if the farmers who own the mares refused to patronize a stallion having a transmitable weakness or faulty conformation conducive to weakness, the value of such an animal will be greatly depreciated.

SHY BREEDING MARES.

The farmers have been so exceedingly busy all over the country this fall that we have said very little about fall breeding, but there will soon be a time when most of the farmers will have a little leisure time. There is a class of mares that should be bred by all means during the winter months so that they will have several weeks of absolute rest. This class of mares are those that are worked extensively during the spring months and their vitality is taxed to the limit. By having several weeks of idleness and good care, with an abundance of feed in the country, many of these mares can be fertilized by the natural service at this time.

There is another class of mares that should be bred soon. These are the mares that were treated last spring and did not settle at a later service. The mares which do not have a discharge may be settled with the stallion. There is this difficulty with treating diseased mares—it sometimes takes months or a year for the membranes to assume a natural, healthy condition after such treatment. In that case the mare owner might become disgusted and change to a new sire, and the mare having fully recovered might settle at the first service, which would be a great advertisement for the new horse.

An opportunity should be given these mares at this time since they have had plenty of feed, rest and time to recuperate. The stallion owners may feel that breeding these mares may not be profitable, from an immediate financial standpoint, but every one of these shy breeding mares that can be started is a benefit to the stallion owners in the future. A few services is also a good thing for the average stallion or jack. If jacks are to be used during cold weather the services must usually be made in a warm, quiet enclosure, as the season of lower temperature may not be suitable as a time for quick service.

EDUCATING MARE OWNERS.

The cheapest method and if properly handled the most permanent method, of educating the customers of a valuable sire is to have them read the American Breeder. To this end we have, in former seasons, made a price for the American Breeder for a few issues during the winter months and put therein valuable information on horse breeding subjects of especial interest to mare owners. We have received many requests from stallion and jack owners to make another rate of this kind. This requires an enormous amount of work, but if it is the wish of the breeders in general we will prepare another series of mare owner editions. Most of the requests for these editions have come from those who have sent them to their customers in former years. They state that it is an excellent way to get new subscribers for the American Breeder.

We shall abide by the decision of the stallion and jack owners in this matter. There is probably no better way of advertising, as well as teaching, the better principles in horse breeding to the mare owners.

AUCTIONEERS AS BREEDERS.

An Iowa subscriber writes us asking our opinion as to whether it would interfere with his horse breeding business to become a first class auctioneer; whether it would add to his business or not; also what we think of the auction business.

There is probably no other one business that can be carried on as successfully with the standing of stallions and jacks as that of holding public sales. The sales begin in the fall after the breeding season is over and usually terminate before the breeding business starts in the spring. These farm sales would put the auctioneer frequently in the company of the patrons of his breeding stock and afford an excellent opportunity for soliciting business and collecting service fees. It would be difficult for any mare to get away without the auctioneer being in a position to realize on the service fee. His acquaintance with the mare owners over a very large territory would also add to his value as an auctioneer.

It seems to us that this subject might be studied with profit by a great many young men who are standing stallions and jacks. There are in many localities men crying sales who have reached the shady side of life who can be succeeded by a younger man capable of leading the strenuous life of an auctioneer during the sale season. Younger men, who secure the proper training, will better adjust themselves to the modern lines and be of more service to themselves and their communities.

The field for auction work is large and there is a constantly growing tendency toward selling all kinds of property in this way. As is the case with the breeding business, the man who secures special training for himself (other things being equal) is the man who will make the greatest success.

STALLION OWNERS' INSTITUTES.

When farmers' institutes were first originated they were gatherings of farmers who would meet to discuss their problems. At the beginning the growth was very slow indeed; the average farmer thought that he was thoroughly posted on the plowing and sowing of such crops as he cared to raise. One reason was that among ordinary farmers there are not a large per cent of them who can or will speak in public. Their experience in life has been in a different direction, but later different states and colleges became affiliated with this work and the growth has been marvelous, developing to the extent that there are not enough good, substantial instructors to deliver the addresses at these meetings. But the agricultural colleges are turning more trained men out to help and it is remarkable the good farmers receive at such gatherings. Every farmer should become affiliated with this work.

It is largely through these farmers' institutes that interest has been aroused in maintaining the fertility of the soil. Farm products have been increased in many communities; farmers have been taught what to raise and how to raise it, and how to care for it, in fact, everything pertaining to that particular occupation.

Stallion owners are now in the same position that the farmers were when they first started farmers' institutes. If some public spirited horse breeder would start a horse breeders' institute in his section of the country and employ qualified speakers, great good could be accomplished in this direction. There are a great many important subjects that could be discussed, and it should not be delivered to the stallion owners exclusively, but every mare owner in that section of the country should receive a special invitation. Better methods in horse breeding will come about only through education, and especially for mare owners. Every horse breeder should strive to teach the fundamental principles at least, in his community. The speakers at a meeting of this kind should be men thoroughly qualified. We do not mean by this one who has had a lifetime of experience, but one who has received the right kind of training that will be of a lasting nature and be an improvement.

There is no subject as important today as that of horse breeding, and we are very sorry to say that it has been the most sadly neglected subject in agriculture. Those who should be in a position to distribute this knowledge are not well enough qualified as a rule. These statements are made in the best of spirit—not to criticise, but to stimulate.

The income from the average stallion can be doubled without increasing the investment. This one statement alone should be sufficient to encourage breeders to familiarize themselves with their own occupation. This is not a mere statement; hundreds of men have done it. This is the best of evidence.

To the American Breeder:—This is to thank you for awarding picture and story of my colt first prize in the American Breeder Boys' Club colt exhibit. Also wish to thank you for check which my father has forwarded to me, and for cut. I will send you a copy of issue of the Meriden Ledger in which story and picture will be printed in a few days. My colt is doing well. Papa wrote me that she weighed 590 pounds the day she was four months old, and I am getting anxious for Thanksgiving to come so I can go home and see her.—Elmer G. Becker, Jefferson County, Kansas.

PARTIALLY PERSONAL

Reports of a "piano contest" being carried on by an Olathe, Kas., paper show Lorena Swett in the lead. It was ever thus.

"A New Dun Manager Here" was the way the caption read, but the story made no mention of a new head for the collection department.

Again we are reminded—did you ever know of a fair or live stock show which did not break all previous records—in some papers?

Dr. O. O. Wolf of Ottawa, Kas., is one of the breeders and veterinarians overtaken by a public office in the recent election. Dr. Wolf was elected to the state senate, pulling votes from all parties.

Another "mentioned for secretary of agriculture" in the new cabinet is John M. Stahl of Quincy, Ill., editor of two farm papers, and once prominent in incubator advertising as the manufacturer of the "Wooden Hen."

The Baker Manufacturing Company, makers of gasoline engines, windmills, etc., is moving to Kansas City from Evansville, Wis. Several smaller plants have been absorbed by the Baker company.

Speaking of the Bisonte at Hutchinson. It certainly is some hotel, but guests are advised to have their family physician at hand when the bill is presented.—Kansas Industrialist.

Frank D. Tomson, who has long been one of the popular live stock advertising field men, has "quit the road" to handle the Iowa business of a silo company.

J. G. Truman, who is "the man on the job" at the American end of the Pioneer Stud Farms' great draft horse business, has been elected president of the Thorney Shire Horse Show, one of the leading Shire exhibitions of England.

General satisfaction is expressed in Kansas by those familiar with the men chosen at the selection of W. M. Jardine for director of the Agricultural College experiment station, and Geo. K. Helder for superintendent of the big branch station at Hays.

About half of the last report of Secretary James Wilson, United States Department of Agriculture, is given over to Secretary Wilson's review of the work done during his sixteen years in the cabinet. It is doubtless instructive, but hardly as lively reading as would be the comments of some other people on certain unmentioned features of the department's work.

Under a "rock road" map printed in a prominent city daily, appeared this line: "Out of Sedalia 18 arteries radiate, through which the life-blood of the farmers is pumped." Now do the farmers of Pettis county really get their life blood from Sedalia, or did they mean "sucked" instead of pumped, or just what did the "figuratively speaking" line writer have on his mind?

President Waters of the Kansas Agricultural College appears to have the solid backing of the Sunflower state to a good sized boom that has been started to put him at the head of the United States Department of Agriculture. Now if the Kansas papers will quit laying so much stress on the point that President Waters is a "Kansan" he ought to get an equally unanimous support from his home state of Missouri.

The International Stock Show

Sustains the Distinction Won For Including Premier Heavy Horse Show of Continent. Breeding Stock and Fat Cattle. The Public Sales.

The International Live Stock Show, held each December at Chicago, finds its greatest distinction in the showing of heavy horses it brings out. The cattle shown have advanced in flesh and coats of hair over their condition at the fall fairs, of course, but after all, it is much the same lot of Shorthorns, Herefords, Angus, Galloways, Polled Durhams and Red Polls, as has been seen by any one "making" the state fairs. Excepting for the exhibit of fat barrows the International's showing of hogs is surpassed by many of the state expositions. Sheep came out at Chicago in good force and the best of quality. But, as we said before, it is the showing of heavy horses to be seen at Chicago, which constitutes a feature not to be matched elsewhere on this continent.

This month's International was no exception in that respect. Something like 1,000 head of draft horses were entered for prizes, the Percherons, as usual, leading in numbers, by a wide margin. In telling the story of this show, we take it that the report of the winnings is more edifying than voluminous comment, and herewith present the lists in full:

Percheron Awards.

Judges — Robert Graham, Toronto, Canada; Dr. Carl W. Gay, Philadelphia; Prof. W. B. Richards, North Dakota.

Exhibitors — Burgess Stock Farm, Bell Bros., Daniel Cahill, J. Crouch & Son, W. S. Corsa, Finch Bros., Dunhams, High Knob Farm, Luther Huston, Junkens & O'Neill, Loeser Bros., Lonzo McClain & Sons, McLaughlin Bros., H. G. McMillan & Sons, S. Metz & Son, R. A. Long, Maasdam & Wheeler, Ohio State University, W. V. R. Powis, A. L. Robinson & Sons, J. O. Singmaster & Son, Taylor & Jones, Trumans' Pioneer Stud Farm, Geo. W. Phillips, E. W. Walker & Sons, Thos. & Jas. Woulf, H. B. Welsh, Thalus Huston, J. J. Pendergast and E. R. Shaw.

Aged Stallion—First, Crouch & Son on Imprecation; second, Trumans on Intitule; third, Crouch & Son on Ildefouse; fourth, Singmaster & Son on Ibis; fifth, Singmaster & Son on Ithos; sixth, McMillan & Sons on Incruste; seventh, Crouch & Son on Imperator; eighth, Bereman on Grenat.

Three-year-old Stallion — First, Crouch & Son on Jasmine; second, Crouch & Son on Jeanbort; third, Burgess on Jusque; fourth, Crouch & Son on Jaillissant; fifth, Taylor & Jones on Jaudun; sixth, Singmaster & Son on Jablot; seventh, Burgess on Jersey; eighth, Robinson & Sons on Jayet; ninth, Trumans on Joignaut.

Two-year-old Stallion—First, Burgess on Klaqueur; second, Burgess on Klient; third, Bell Bros. on Korps; fourth, Crouch & Son on Konsecutif; fifth, Burgess on Charmer; sixth, Burgess on Komtois; seventh, Dunhams on Krustace; eighth, Trumans on Komitat; ninth, Burgess on Knout; tenth, Bell Bros. on Komite; eleventh, Taylor & Jones on Koncini.

Yearling Stallion—First, McMillan & Sons on Matador; second, McMillan & Sons on Bonus; third, Corsa on Carbon; fourth, McMillan & Sons on Jerard; fifth, Burgess on Pedro; sixth, Augustin on Rob Roland; seventh, Maasdam & Wheeler on Nelation; eighth, Singmaster & Son on Labarum.

Stallion Foal—First, Singmaster & Son on Keota Black Beauty; second, Corsa on Carlothern; third, Finch Bros. on Finch's Lion; fourth, Luther Huston on Favorite; fifth, Corsa on Carshon; sixth, Metz & Sons on Majon; seventh, Augustin on Roland D.

Aged Brood Mare—Trumans on Hysope; second, McMillan & Sons on Rosine; third, Maasdam & Wheeler on Patrie; fourth, Singmaster & Son on Habitude; fifth, Robinson & Son on Neta; sixth, Augustin on Coquette; seventh, Crouch & Son on Girouette; eighth, Beremon on Harmonie.

Three-year-old Mare—First, Crouch & Son on Justice; second, Singmaster & Son on Jactelle; third, Maasdam & Wheeler on Almira; fourth, Bereman on Juvenie; fifth, Dunhams on Jenfosse; sixth, Luther Huston on Jactance; seventh, High Knob Farm on Justification; eighth, Crouch & Son on Jeanne.

Two-year-old Mare — First, Burgess on Kaliope; second, Crouch & Son on Kaoline; third, Burgess on Mignon; fourth, McMillan & Sons on Roselle; fifth, Dunhams on Kassarde; sixth, Crouch & Son on Katane; seventh, Crouch & Son on Kouture; eighth, Augustin on Riola; ninth, Singmaster & Son on Kra.

Yearling Mare—First, Corsa on Empreto; second, Metz & Son on Lucerne; third, Metz & Son on Laya; fourth, McMillan & Sons on Kordie; fifth, McMillan & Sons on Ella; sixth, Singmaster & Son on Lentille; seventh, Shaw on Carnotta.

Filly Foal—First, Corsa on Carneito; second, Corsa on Carnona; third, Augustin on Ropend; fourth, Robinson & Sons on Adeline; fifth, Ohio State University on Lady Intime; sixth, Robinson & Sons on Regetta; seventh, Corsa on Carmoress.

Stallion and Three Mares—First, Crouch & Sons; second, Singmaster & Son; third, McMillan & Sons; fourth, Corsa; fifth, Maasdam & Wheeler; sixth, Augustin.

Get of Sire—First, Corsa on the get of Carnot; second, McMillan & Sons on the get of Calypso; third, Augustin on the get of Roland; fourth, Corsa on the get of Carnot; fifth, Robinson on the get of Rabelais; sixth, Huston on the get of Mustapha.

Produce of Dam—First, Corsa on the produce of Empress; second, Corsa on the produce of Folichonne; third, Corsa on the produce of Bona; fourth, Augustin on the produce of Pendora; fifth, McMillan & Sons on the produce of Rosine; sixth, Robinson & Son on the produce of Ruth Kastelle.

Three Mares, Any Age—First, Ringmaster & Son; second, Crouch & Son; third, McMillan & Sons.

Five Stallions, Any Age — First, Crouch & Son; second, Burgess; third, Singmaster & Son; fourth, Trumans; fifth, Dunhams.

Senior Champion Stallion—Crouch & Son on Imprecation; reserve, Crouch & Son on Jasmine.

Junior Champion Stallion — Burgess on Klaqueur; reserve, Burgess on Klient.

Senior Champion Mare—Trumans on Hysope; reserve, Crouch & Son on Justine.

Junior Champion Mare—Burgess on Kalliope; reserve, Corsa on Empreto.

Grand Champion Stallion—Crouch & Son on Imprecation; reserve, Burgess on Klaqueur.

Grand Champion Mare—Trumans on Hysope; reserve, Crouch & Son on Justine.

Belgian Awards.

Judges—A. L. Wilson, Creston, Ia., and Eli Springer, Saginaw, Mich.

Exhibitors—Bell Bros., J. Crouch & Son, Finch Bros., Junkens & O'Neil, Henry Lefebure, Loeser Bros., W. V. R. Powis, L. E. Van Arsdale, E. W. Walker & Sons, H. & H. Wolf, T. & J. Woulf, Geo. M. Phillips, Taylor & Jones, Trumans' Pioneer Stud Farm, Wm. G. Lewis, A. C. Hirzel, G. A. McCarty and Maasdam & Wheeler.

Aged Stallions, 4 Years or Over—First and second, Crouch & Sons on Mon Gros and Xavier; third, Lefebure on Jules Remi; fourth, Van Arsdale on Clovis d'Aelbeke ;fifth, Lefebure on Nocturne.

Three-year-old Stallion—First, Loeser Bros. on Frank Boiser; second, Crouch & Son on Alfred; third, Finch Bros. on Challenge; fourth, Lefebure on Cognac; fifth, Bell Bros. on Marichau.

Two-year-old Stallion — First, Bell Bros. on Cyclon; second, Crouch & Son on Farceur de Taviers; third, Finch Bros. on Picka; fourth, Trumans on Imbattable; fifth, Loeser Bros. on Cesa du Marais.

Yearling Stallion—First, Van Arsdale on Major d'Esemael; second, Finch Bros. on Minos; third, Hirzel on Prince Royal; fourth, Walker & Sons on Captain; fifth, Walker & Sons on Colonel.

Stallion Colt—First, Van Arsdale on Clovis d'Esemael; second, Powis on Prince Bleddyn; third, Finch Bros. on Mon Premier.

Aged Brood Mare—First, Crouch & Son on Elza; second, Crouch & Son on Betzy de Voorde; third, Wolf on Bibi de Kleyem; fourth, Finch Bros. on Saby; fifth, Lefebure on Anna du Balcon.

Three-year-old Mare — First, Bell Bros. on Sarah de Dottigdules; second, Crouch & Son on Clara; third, Crouch & Son on Suzanne; fourth, Maasdam & Wheeler on Abbesse; fifth, Wolf on Caboche.

Two-year-old Mare—First, Crouch & Son on Mizette; second, Crouch & Son on Princesse d'Uyt Marquis de Kleyem; third, Crouch & Son on Helena; fourth, Crouch & Son on Bella; fifth, Lefebure on Suzette.

Yearling Mare — First, Woulf on Lloune; second, Lefebure on Paula de Lens; third, Woulf on Lola; fourth, McCarty on Elsie; fifth, Powis on Mona Lisa.

Mare Colt—First, McCarty on Rose de Stalbille.

Three Mares, Property of One Exhibitor—First, Crouch & Son; second, Wolf.

Five Stallions, Any Age, Property of One Exhibitor—First, Crouch & Son; second, Bell Bros.

Champion Stallion—Crouch & Son on Mon Gros; reserve, Bell Bros. on Cyclon.

Champion Mare—Crouch & Son on Elza; reserve, Bell Bros. on Sarah de Dottigdules.

Shire Awards.

Judges—Robert Graham and C. T. Curtis.

Aged Stallion—First, Trumans on Lockenge Hanjist; second, Burgess on Oulton Lowe Model; third, Burgess on Weller Duke; fourth, Taylor & Jones on The Baron 11th; fifth, Trumans on Ashbeach Excelsior; sixth, Trumans on Jester.

Three-year-old Stallion—First, Taylor & Jones on Severn Flag; second, Trumans on Friar's Balsam 2d; third, Trumans on Lord Carlton; fourth, Trumans on Dunsmore Royal Lad; fifth, Trumans on King Hoe; sixth, Williams on William's Nottingham Victor.

Two-year-old Stallion — First, Burgess on Freemason 2d; second, Trumans on Lion Heart 2d; third, Taylor & Jones on Powisland Paragon; fourth, Sizer on Tatton Dray King.

Yearling Stallion—First, Trumans on Carlton Royal Grey; second, Burgess on Emval; third, Finch Bros. on Prospect F.; fourth, Trumans on Aylesford Menestrel.

Stallion Foal, American Bred—First, Sizer on Tatton Eldorado; second, Williams on Titanic; third, McCray & Fowler on Royal Surprise; fourth, Williams on Williams' Nottingham Victor 3d.

Aged Brood Mare—First, Trumans on White Meadow Dainty; second, Trumans on Dewstow Fucia; third, Sizer on Elder Sunset; fourth, Galbraith & Son on Dowsby Sunbeam; fifth, Trumans on Smithfold Phyllis.

Three-year-old Mare—First, Junkens & O'Neil on Enfield Rosebud; second, Sizer on Horbling Heather 3d.

Two-year-old Mare—First, Burgess on Wallington Sunbeam 3d; second, Trumans on Laithwaite Rose;; third, Trumans on Normandy Sweetbriar; fourth, Finch Bros. on Alpha C.

Mare—First, Trumans on Trumans' Coldham Princess; second, Soderberg on Osco Princess; third, Williams on Horbling Patch.

Filly Foal—First, Sizer on Tatton Model; second, Sizer on Tatton Jewel; third, Williams on Williams' Flower 5th; fourth, McCray & Fowler on Prairie Queen.

Stallion and Three Mares, Any Age—First and second, Trumans; third, Sizer.

Clydesdale Awards.

Judges—Robert Ness of Canada, and Profs. Chas. Curtiss and W. B. Richards.

Aged Stallion—First, Graham Bros. on Lord Gleniffer; second, Conyngham Bros. on Flisk Prince; third, Kennedy on Dinwoodie Star; fourth, Graham Bros. on Golden Knight; fifth, Fairbairn on Mikado.

Three-year-old Stallion—First, McLay Bros. on King Norman; second, Galbraith & Son on Boreland; third, Blythewood Farm on Scottish Kippling; fourth, Graham Bros. on Royal Cadet; fifth, Graham Bros. on Bright Smile.

Two-year-old Stallion — First, Graham Bros. on King of All; second, Conyngham Bros. on Baron Dalmeny; third, McLay Bros. on Charter Oak; fourth, Soderburg on Osco Pride; fifth, McLay Bros. on King's Buckler.

Yearling Stallion—First, Galbraith & Son on Charnock; second, Graham Bros. on Alert; third, McMillan on Bruce Meeker; fourth, Wylie on Barney Carruchan; fifth, Graham Bros. on Royal Dragoon; sixth, McLay Bros. on The Model Prince.

Stallion Foal—First, Barron on Pinnacle 2d; second, McLay Bros. on Heather Duke; third, Fairbairn; fourth, McLay Bros. in The Grandeur; fifth, Wilson on Duke of Argyle.

Aged Brood Mare—First, Fairbairn on Harvieston Baroness; second, Fairbairn on Princess Fortune; third, Conyngham Bros. on Purple Heather; fourth, Conyngham Bros. on Pride of Drumlanrig; fifth, Kennedy on Lady Effie.

Three-year-old Mare—First, Conyngham Bros. on Lady Lochfergus; second, McLay Bros. on Graceful Lady; third, Conyngham Bros. on Maggie Hunter; fourth, McLay Bros. on Missie; fifth, Wilson on Auchencovie Baroness.

Two-year-old Mare—First, Fairbairn on Lady Lustrous; second, Conyngham Bros. on Shalloch Mary; third, Conyngham Bros. on Hillside Princess; fourth, Soderberg on Osco Rose; fifth Barron on Mayflower.

Yearling Mare — First, Conyngham Bros. on Blythewood Queen; second, Soderberg on Osco Bell; third, Conyngham Bros. on Heather Duchess; fourth, Kennedy on Lady Jane Morton; fifth, Soderberg on Mary Queen of Scots.

Filly Foal—First, Fairbairn; second, Graham Bros. on Lovely; third, McLay Bros. on Buchlyvie Lady; fourth, Brookside Farm Co. on Lady Dee Criterion; fifth, Brookside Farm Co. on Cherry Criterion.

Stallion and Three Mares, Any Age—First, Fairbairn; second, Conyngham Bros.; fourth, McLay Bros.; fifth, Kennedy.

Senior Champion Stallion—Graham Bros. on Lord Gleniffer.

Junior Champion Stallion—Galbraith & Son on Charnock.

Senior Champion Mare—Fairbairn on Harvieston Baroness.

Junior Champion Mare—Fairbairn on Lady Lustrous.

Champion American Bred Mare—Fairbairn on Princess Fortune.

Grand Champion Stallion — Graham Bros. on Lord Gleniffer.

Grand Champion Mare—Fairbairn on Harvieston Baroness.

Welsh Pony Awards.

Aged Stallions—First, Geo. A. Heyl & Son, Washington, Ill., on Gwyndy Brennin; sire, Prince of Cardiff; second, Geo. E. Brown, Aurora, Ill., on Criterion; sire, Mountain Pony; third, Brown on Warwick; sire, Radnorshire Flyer; fourth, Louis Lee Haggin, Lexington, Ky., on Forest Hero; sire, Forest Adbotten Sir Horace; fifth, W. E. Dee of Illinois on Sam.

Three-year-olds — First, Brown on Tip Top; sire, Firebrand; second, Heyl on Llwyn King; sire, Llwyn Gaffor.

Two-year-olds—First, John Alexander of Illinois on Llwyn Chief; sire, Prince of Cardiff; second, Heyl on Llwyn Emperor; sire, Llwyn Tyrant.

Aged Mares—First, Brown on Llwyn Rosebud; sire, Prince of Cardiff; second, Heyl on Llwyn Daisy; sire, Llwyn Tyrant; third, Alexander on Forest Brown Queen; sire, Forest Abdolton; fourth, Alexander on Aurora Bell; sire, Goldfinder; fifth, Heyl on Sweet Marie; sire, Longmund Boy.

Three-year-olds — First, Brown on Fickle; sire, Mountain Pony; second, Heyl on Foregate Polly; sire, Dick Hill; third, Heyl on Llwyn Scepter; sire, Llwyn Tyrant; fourth, Brown on Pauline; sire, Coppice Sensation.

Two-year-olds—First, Alexander on Grand Duchess; sire, Forest Prince Llewellyn; second, Heyl on Llwyn Bracelet; sire, Llwyn Tyrant.

Mare and Foal—First, Alexander on Castle Fanny; second and third, Brown on Llwyn Wonder and Llwyn Robina.

Best Display Shown to Bridle—First, Heyl; second, Brown; third, Alexander.

Single Ponies in Harness—First, Brown on Fickle; sire, Mountain Boy; second, Brown on Tip Top; sire Mountain Pony; third, Brown on Llwyn Rosebud; sire, Prince; fourth, Alexander on Castle Fannie; sire, Foundation Stock.

Pairs—First, Heyl on Gwyndy Brennin and Llwyn Daisy; second, Brown on Llwyn Rosebud and Mate; third, Heyl on Llwyn King and Llwyn Empior; fourth, Haggin on Forest Lady Glyn and Forest Hero.

Tandems, Not Exceeding 48 Inches—First, Heyl on Llwyn King and Llwyn Empior; second, Brown on Mystic and Daisy; third, Alexander on Goldfinder and Aurora Bell; fourth, William E. Dee on Sam and Collet.

Tandems, Exceeding 48 Inches—First, Heyl on Gwyndy Brennin and Llewyn Daisy; second, Brown on Llewyn Rosebud and Mate; third. Brown on Llwyn Sunset and Llwyn Blue Bell.

Ponies Under Saddle—First, Heyl on Foregate Polly; sire, Dick Hill; second, Brown on Llwyn Flirt; sire, Prince of Wales; third and fourth, Heyl on Sweet Marie and Llwyn Daisy.

Shetland Pony Awards.

Aged Stallions—First, Geo. A. Heyl & Son, Washington, Ill., on King Larigo; sire, Kinzie; second, A. G. Lupton Farm of Indiana on Peter Pan; sire, Abelard; third, Heyl on Silver Tips; sire, Jupiter; fourth, Lupton on Chestnut Prince; sire, Chestnut.

Three-year-olds—First, Lupton on Me-En-Gau; sire, Abelard; second, Heyl on Silver Tips 2d; sire, Jupiter.

Two-year-olds—First, Lupton on Valor Lupton Farm; sire Abelard; second, Lupton on Nilo of L. F.; sire, Initial; third, Heyl on Harum Dell; sire, David Harum; fourth, T. S. Simpson & Sons Aurora, Ill., on Bramhops Cilla's Model; sire, Madcap.

Aged Mares—First, Simpson on Prim; sire, Heaton; second, Heyl on Pearl; sire, Kinzie; third, Simpson on Squirrel; sire, Robbin; fourth, Lupton on Juletta; sire, Chestnut.

Three-year-olds—First, Simpson on Madcap's Beauty; sire, Madcap; second, Lupton on Princess Thyra; sire, Abelard; third, Heyl on Priscilla; sire, King Larigo; fourth, Simpson on Stella; sire, Madcap.

Two-year-olds—First, Heyl on Princess Larigo; sire, King Larigo; second, Lupton on Gazello; sire, Abelard; third, Simpson on Promised Luck; sire, Horace; fourth, Simpson on Pride of Bramhope Villa; sire, Madcap.

Pony in Harness—First, Heyl on King Larigo; second, Lupton on Peter Pan; third, Lupton on Me-En-Gau; fourth, Heyl on Silver Tips.

Pairs in Harness—First, Heyl on King Larigo and Priscilla; second, Heyl on Silver Tips and Silver Tips 2d; third, Lupton on Me-En-Gau and Valor; fourth, Lupton on Juletta and Chestnut Prince.

Tandems—First, Heyl on King Larigo and Priscilla; second, Heyl on Silver Tips and Silver Tips 2d; third, Lupton on Chestnut Prince and Juletta; fourth, Lupton on Valor and Me-En-Gau.

Four-in-hands—First, Heyl on King Larigo, Priscilla, Pearl and Phoebe B.;

(Continued on page 15).

THE HORSE BREEDING SCHOOL

NEXT TERM JANUARY 13 TO 18

Breeders with money invested in the business cannot spend a week's time and their tuition fee to better advantage. Fathers and mothers need not be afraid to send their boys. Ask any graduate. Read these letters:

Have attended the Graham Scientific Breeding School, and any one of the lectures is worth the tuition, and I would not take $500 for what I got out of this term.—Rudolph Svitak, Marion, Kas.

This is my second term at the Graham Scientific Breeding School, and there is a great improvement in the school to what there was over a year ago when I attended before. One lecture from either instructor is worth many times the tuition and expenses, especially navel ill and the barrenness and sterility in both male and female, to the young men, especially, who have to take the older one's place in modern breeding and try to improve live stock and better methods of producing them. It is the duty of every horse breeder to attend and get his friends to attend also.—T. J. Cunningham, Cartmell, Mo.

This is my second term of attendance at the Breeding School. I find it has improved wonderfully and would not take many times my expenses for the information I have derived.—Thomas Enright, Patterson, Ia.

I attended the Graham Scientific Breeding School and think that one lecture paid me for all it cost, saying nothing about many of the others.—F. U. Williams, Charlotte, Ia.

I have attended the Graham Scientific Breeding School for the second time, and I think the one lecture on types and breeds was well worth the time and money it has cost me.—H. A. Kersting, Gilmore, Mo.

Having attended the Graham Scientific Breeding School can truthfully say that no father or mother can send their boy to a better or more moral school than the Graham Scientific Breeding School.—G. L. Deer, New Market, Ind.

I have attended the Graham Scientific Breeding School and wish to say that I found it all and more than I had expected. The lectures are the best the world has ever produced, and I wish to emphasize the fact that you will find no graft in the matter from start to finish.—J. W. Wallace, Ewing, Mo.

I have attended the Graham Scientific Breeding School in Kansas City and one of the most interesting lectures received was on "Germs—What They Are, Where They Are, and What They Do." Every man ought to be more interested in this great work.—Joe Kejr, Dorrance, Kas.

Having just returned from attending the Graham Scientific Breeding School for the fourth time, will say that I was greatly surprised at the improvement of all the instructors. I wish every stallion or mare owner could attend, and wish every mare owner could have heard the lecture on the subject of navel ill.—T. H. Terry, Bavaria, Kas.

I have just attended another term of the Graham Scientific Breeding School and find it much improved since my last visit three years ago. No modern breeder can afford to miss this school, as any one lecture is worth the tuition, and it gives many chances of meeting up-to-date breeders from all over the states and foreign countries.—Bert Taylor, Frederick, Ok.

I consider that learning to tell when a mare is with foal is worth more to me than the cost of this term.—J. W. Reed, Eddy, Ok.

I have attended the Graham Scientific Breeding School and I think that any man that is a breeder of horses ought to attend this school and bring his friends, and especially his boys.—J. J. Ernst, Floris, Ia.

I have attended the Graham Scientific Breeding School and can say one lecture that was given on navel ill is worth many times the tuition.—William Bruning, Easton, Ill.

I traveled more than 600 miles to attend the last term of the Graham Scientific Breeding School, and consider my time and money well invested. The instruction received means dollars and cents to the student, and the moral influence of the school is especially good.—J. M. Tollman, Marsland, Neb.

This is my second visit to the Graham Scientific Breeding School. I find it up-to-date in every lecture and find it well worth my while to have come many hundred miles to attend. I would advise every breeder and importer to attend.—Edgar Steyaert, Moerbek, Belgium.

I have just attended my fourth term at the Graham Scientific Breeding School and have greatly enjoyed the social and moral atmosphere which seemed to pervade this term of school. The instruction in all departments has been very thorough. Have been very successful in using the capsule system.—Joe V. Painter, Middletown, Ind.

The value of the information that I received along the different lines of instruction, and the high standard of the instructors (who were the peer of any I have ever heard) and the high moral character of the men in charge of the Graham Scientific Breeding School, surpasses all expectations, and the financial value can not be estimated.—W. H. Hannah, Tontogany, Ohio.

I wish to say that I am highly pleased with the Graham Scientific Breeding School. What we learn in each lecture is worth more than the cost of attending and the information on judging horses is great.—A. J. Dunaway, Chilhowee, Mo.

I have just completed the course in the Graham Scientific Breeding School and I consider the one lecture on the barren mare alone worth $100 to any stallion or mare owner. The Graham Scientific Breeding School is doing a great work and every stallion and jack owner should attend it, as the increased profits in one season will several times pay the cost of a term. J. A. Watkins, Warren, Ark.

Have just attended the second term of the Graham Scientific Breeding School. I came 2,000 miles to the school and it is worth many times what it cost me, both mentally and morally. A. E. Rockey, Vollmer, Idaho.

I attended the Graham Scientific Breeding School, December 18 to 21, and am so well pleased with what I learned that I cannot value it high enough. It is clean and moral enough to satisfy the best. The heart talks we had were right to the point and much good was done, both in a scientific way and moral way. W. F. Dusell, Montevideo, Minn.

Have attended the Graham Scientific Breeding School and have received many times the price of the tuition at each term of school, and every man that owns a stallion should attend. J. H. McKinney, Edgerton, Kans.

I have attended two terms of school and consider it worth many times the cost to any live stock breeder. W. S. Catlin, Olathe, Kans.

I have attended the Graham Scientific Breeding School and find it much better than I expected. One lecture is worth the whole time and expense. S. L. DeWitt, Blue Springs, Mo.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demontrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot: get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL

225 West Twelfth St., Kansas City, Mo.

A General Decline in Prices.

Horse Market Feeling Holiday Quiet, But Much Better Than Last Year. Heavy Cattle and Hog Runs Gave Packers a Chance to Depress Prices.

About normal conditions prevail in the horse and mule trade for this season of the year. There is some trade, but the volume of business is considerably smaller than a few weeks ago. The falling off in demand is due entirely to the nearness of the holidays which is keeping buyers off of the market. This period of the year, however, compared with a year ago, shows much more favorable conditions. Last year the dull season began early in November, and continued until the latter part of March. This year the abatement in trade appeared about two weeks ago, and is expected to disappear early next year, not later than the middle of January. Some dealers quoted prices down $10 to $15 a head in the past two weeks, but there have been some of the better classes of horses that looked nearly as good as any time this year. The main trouble has been that demand was very uneven. A few days ago buyers were fairly anxious to fill orders and the following days there would not be enough trade to indicate what was the status of the market. The next two weeks trade will be the dullest of the season and practically a nominal affair. Hardly any shipments are expected in that time, and the few sales to be made will be on orders. Dealers say that the past six months, barring moderate receipts, has been an unusually prosperous one for horse men. They have operated on narrow margins, but sales as a rule were quick, and few losses were reported. The general practice of forwarding horses by express has been a means of preventing any congestion in supplies at Eastern markets. Feeders have been in the competition all along and prevented breaks that usually occur on the class in thin condition. The big dealers say they expect a big business early next year. A good many fed horses from nearby feed barns will be marketed early, and the fact that Easter comes in March will be taken as an indication of an early spring. Farmers will want to fill their needs early, and with this year's prosperity continued by the excellent condition of fall sown crops there is every indication that all classes of construction work will be pushed. Most of the horses sold in the past two weeks were at $100 to $175, and mules at $125 to $225. More heavy mules than heavy horses were offered. At no point are supplies heavy or show any congestion. Shippers are advised to send only moderate consignments to market in the next few weeks.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs, up.	$225@285
Drafters, fair to good	140@220
Chunks, good to choice	125@160
Chunks, fair to good	85@120
Expressers and light draft	50@110
Plain workers	40@ 85
Southerners, good	120@135
Southerners, plain to fair	60@115
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 75@120
14 to 15½ hands	110@150
15½ to 16 hands	140@185
16 to 16½ hands	180@265

Big Break in Cattle Prices.

In the past two weeks cattle prices broke more severely than in any previous similar period this year. The general opinion places the two weeks drop at 65 cents to $1, or an average of 75 cents. Some of the commonest kinds are off no more than 25 cents, and some of the good short fed kinds are down as much as $1.25. Feeders have themselves to blame for such a break. Two weeks ago the market showed weakness and promised temporary liberal receipts. Instead of nursing the market as conditions justified countrymen on two occasions glutted the Chicago market with two Monday runs of 35,000 and 40,000, and a Wednesday supply of 30,000. The pendulum of supply swung quickly from scarcity to oversupplies, and lower prices were inevitable. The liberal movement fell at a time, too, when the grass season was ending, and before killers had time to try out by actual killing test the real merit of the short fed kinds. The main excuse offered for such liberal supplies was that feeders had procured remarkable gains on short feed and the cattle if marketed before Christmas would make good profits. They were unwilling to risk a sure thing for the uncertainties that might develop with rough weather and late marketing. The present movement, however, has been a tax on future supplies and the recession in the market appears at an end. Christmas cattle, however, drew out all the available supply of long fed steers, and from now on it is evident that $9 to $9.50 will be about the top quotations. Chicago reported some $11 to $12, Christmas beeves, and in Kansas City seven head weighing 1,741 pounds brought $11.10, the highest price ever paid on the local market. Other steers that looked Christmassy landed at $10 to $10.50, and included yearlings at $10.25. The bulk of the short fed steers are bringing $7.50 to $8.50. Most of them have been fed 40 to 60 days. On the quarantine side meal fed steers sold at $6 50 to $7.50, and a good many loads of common grass steers brought $4.50 to $5.50.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.85@9.75
Good to choice steers	7.75@8.80
Fair to good steers	7.25@7.70
Common to fair steers	4.50@7.20
Meal fed, choice	7.00@7.75
Meal fed, common to fair	5.00@7.00

Slight Changes in Butcher Cattle.

Notwithstanding the severe break that occurred in steer prices there was only a 15 to 25 cent loss on butcher cattle. This unimportant change came through a series of weak markets, and buyers had a hard time to get that much off. The reason that she stuff is so completely out of the control of killers is the urgent requirements for breeding purposes. The thin classes sell more freely than the kinds that are wholly suited for killing purposes. The range in cow prices is from $3.25 to $7.25, and heifers $4 to $8.50. Packers are not expecting very large receipts of she stuff at any time in the next few months. Veal calves were quoted about steady. The top price in Chicago was $10.50 and elsewhere $10.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.25@ 7.25
Fair to good	4.85@ 6.20
Common to good	4.00@ 4.80
Canners	3.25@ 4.00
Heifers—	
Choice fed	8.00@ 8.50
Good to choice	6.50@ 8.00
Plain to fair	5.25@ 6.45
Common	4.00@ 5.25
Veal Calves	4.50@10.00
Bulls	3.50@ 6.25

Slight Declines For Thin Cattle.

Stock and feeding cattle met a more consistent demand than fat steers, and prices for them were lowered on 15 to 25 cents. This is evidence that while one part of the country is supplying the killer with fat cattle there is still an urgent demand for more to go on feed. Good Panhandle steers in the 400 to 1,100 pound classes are bringing $6.50 to $7.50, and are going to the finishers in the corn belt. Stock cows and heifers are as high as any time previously, and the most loss has fallen to the half fat heavy feeders. Stock calves are steady.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.25@7.75
Good to choice feeders	6.50@7.20
Plain to fair feeders	5.65@6.45
Selected stockers	6.50@7.25
Good to choice stockers	6.00@6.45
Plain to fair stockers	5.25@5.85
Stock calves	4.75@7.00
Stock cows	3.50@4.50
Stock heifers	3.85@5.25
Milch cows	35.00@90.00

Big Slump in Hog Prices.

In the past seven days hog prices fell 60 to 65 cents a hundred pounds to the lowest level since March 20. Compared with two weeks ago prices Tuesday were down only 50 cents. The cause of the break was liberal receipts. In the past two weeks the five Western markets received 850,000 hogs, or more than in any previous similar period in the past six months. Nearly half the total supply was received in Chicago, and for the greater part of the past two weeks prices were higher at river markets than at the lake market. According to all reports from the country the movement of the past two weeks has drawn heavily on future supplies, and receipts for the next six weeks are expected

PETER HOPLEY & SON,

ATLANTIC and LEWIS, IOWA,

Importers of PERCHERONS and SIRES

We have been making from one to three importations a year since 1884 of the best stallions and mares that we could find in France and Great Britain. **We have now the best lot of both breeds** of stallions and mares, nearly all two-year-olds, that we have ever had on our farms at one time. **They excel in weight, bone and quality.** We have two-year-olds weighing in moderate flesh **up to 1,950 lbs.** We have secured a number the get of the most noted sires in France and Great Britain. **We have a number of top show horses.** We want you to come and look them over, and you will agree that what we have said is conservatively stated, and in spite of our selections we are able to quote very moderate prices. Remember, our horses are all kept at the farms between Atlantic and Lewis, on the main line of the Rock Island, 60 miles east of Council Bluffs.

Wolf Bros. Big Boned Imported Percherons and Belgians

We landed September 1st with a great lot of Percheron and Belgian stallions and mares. We showed at the great Nebraska State Fair September 5th and won the following prizes:

Two champions, one reserve champion, eight first prizes, seven seconds, one third and three fourth—twenty-two ribbons in all.

THESE PRIZE WINNERS ARE ALL AT OUR BARNS AND FOR SALE AT VERY REASONABLE PRICES.

If you are figuring on buying a first-class stallion or a pair of imported mares and want to see the best horses, you cannot afford to miss the opportunity to see ours. Special low prices made for the next 60 days. Address, for all information

Wolf Brothers

Albion, Boone County, Nebraska

IMPORTED STALLIONS

PERCHERON
SHIRE BELGIAN

Each year we show our New Importation the same month they land; each year they win more than all other exhibitors combined. At the American Royal this year we won 2nd on 4-year-old Percheron, 1st, 3rd and 4th on 3-year-old; 1st and 3rd on 2-year-old and 1st and champion on group of five stallions. All are for sale. Our guarantee and insurance are the best. Our horses the best.

PERCHERON IMPORTING CO. CHAS. R. KIRK SOUTH ST. JOSEPH, MO.

W. A. LANG & CO.

Greeley, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS and MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible, and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars. Send for our large CALENDAR, mentioning this paper.

to be light. Some traders believe that the next two weeks will witness a sharp advance in prices. However, the eagerness with which packers put prices down precludes little probability of much advance before the first of the year.

The following quotations are for hogs:

Choice, 250@300 lbs	$7.15@7.25
Choice, 200@245 lbs	7.00@7.20
Medium weight	6.90@7.15
Light weight	6.25@6.85
Common to fair	5.50@6.25
Stags	5.50@7.10
Boars	4.00@6.50
Bulk of sales	7.00@7.20

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Dec. 16	$6.90@7.32½	$7.50@7.90
Tuesday	6.90@7.25	7.40@7.85
Wed., Dec. 11	7.25@7.60	7.40@7.75
Thursday	7.20@7.50	7.45@7.80
Friday	7.10@7.40	7.50@7.85
Saturday	7.00@7.32½	7.50@7.80

Advance and Setback for Sheep.

Sheep prices in the past two weeks were boosted to new high levels for the season, and at the advance lambs sold up to $8 and yearlings $7. In the past two days, however, prices fell back about 25 cents and yesterday were only about 25 cents higher than two weeks ago. The season for fed sheep is well along and the movement from the central belt is heavy. Monday Chicago received 68,000, the largest single day's receipts this year. Most of them were short fed grades. At river markets receipts were moderate. Fat lambs are quoted at $7 to $7.75, yearlings $5.50 to $6.75, wethers $4 to $5, and ewes $3.75 to $4.50.

HORSES IN EGYPT.

The native-bred horse in Egypt, according to an English report, is a very useful type, and for hard work in a warm climate would be difficult to beat. His worst faults are that he is small, narrow through the heart and wants muscle greatly over his thin quarters. He is often erroneously described as an Arab, but, though he has much Arab blood in his veins, he can not be compared with the pure bred Arab. As a harness horse, is not very fast, having little knee and hock action, but has a long stride from the shoulder and covers the ground faster than he seems to. Efforts are being made to improve the Egyptian horse by the placing of good stallions in all the provinces. Thoroughbred horses are imported for this purpose, and it is hoped to obtain ultimately a breed of larger horses with greater bone than is found at present.

A COMMON MISTAKE.

Only a few days ago, the writer, while passing a breeding yard, saw a fine looking stallion standing in a lot at a point where the sun would have a fair shot at him. The lot was enclosed with boards eight feet high, and the space was very limited, making it necessary for the animal to shift around just about right, if he would enjoy the blessed sunshine.

This is only one case in many hundred. After the breeding season is over, most breeders consider that it is not at all necessary to give the stallion the same care, feed and open air exercise as during the strenuous breeding season, which is a mistake that one moment's careful consideration will show. If the stallion is given the same care, feed and attention from now on until the following breeding season, does it not stand to reason that his generative qualities would be higher; his get possess more vigor?

Some breeders seem to be successful with only ordinary care and feed, what would be their measure of success if they would try to keep their stock in prime condition from one year's end to the other? The requirements are extremely simple. See that the stallion gets daily exercise in the open sunlight. If no spacious lot that will safely confine him is convenient, set two posts firmly in the ground, fifty to one hundred feet apart and six or eight feet high. Run a smooth wire (about a number 8), from one post to the other. String a ring on this with a short rope and snap attached, snapping the rope to the bridle or halter of the stallion, and he can take all the exercise he needs, without your losing five minutes of your time.—M. Coverdell, Worth County, Mo.

DATES FOR NEXT FALL'S FAIRS.

The American Association of State Fair Managers held its annual meeting during the "International" at Chicago. J. C. Simpson, secretary of the Minnesota State Fair, was chosen president, and W. R. Miller of the Nebraska State Fair, vice president. Charles Downing of the Indiana State Fair was continued in the office of secretary.

The dates decided on for fairs and expositions represented in the association include the list below:

Grand Forks, N. D.	July 21-26
Des Moines, Ia.	Aug. 21-29
Hamline, Minn.	Sept. 1-6
Lincoln, Neb.	Sept. 1-6
Columbus, Ohio	Sept. 1-6
Milwaukee, Wis.	Sept. 1-6
Indianapolis, Ind.	Sept. 1-6
Topeka, Kas.	Sept. 8-13
Huron, S. D.	Sept. 8-13
Syracuse, N. Y.	Sept. 8-13
Detroit, Mich.	Sept. 8-13
Sioux City, Ia.	Sept. 15-20
Hutchinson, Kas.	Sept. 15-20
Louisville, Ky.	Sept. 15-20
Oklahoma City, Okla.	Sept. 22-Oct. 4
Memphis, Tenn. (Tri-State)	Oct. 22-27
Nashville, Tenn.	Sept. 29-Oct. 4
Helena, Mont.	Sept. 29-Oct. 4

SAYS OUR POSITION IS RIGHT.

To the American Breeder: Your position for a lien on the mare and colt for the service of the stallion or jack is right in every particular. Arkansas has such a law and makes it a misdemeanor to sell the mare or colt if not less than $25 nor more than $100, to trade or sell after the mare is bred without settling in full for the service fee, and then 75 per cent is all you can expect. The law hurts no honest man but is a little rough on rascals. The mare is worth more; will sell or trade for more and the owner can well afford to pay the season. In fact, the American Breeder is a live wire—one of the best papers of its kind in the United States that I have seen. Push the good work, you are going on to success.—John Russ, White County, Arkansas.

TREATING A PIGEON-TOED COLT.

To the American Breeder:—Referring to a recent inquiry, which you published, about treatment for a pigeon-toed colt, I would say from experience that a great deal can be done in this case if the bend is outward at the fetlock, though treatment should have commenced earlier. First stop all unnecessary traveling; rasp the inside of the foot off as much as possible; as soon as possible shoe with half shoe and raise the outside of the foot. Many of these cases can be straightened until they are not perceptible. Rasp every month.—Stanley Turner, Tom Green County, Texas.

U. S. ARMY HORSES WON ONCE.

The United States took highest honors in the first big international contest of this year's national horse show at Madison Square Garden last month. England won second prize and the United States third in this ring.

Chiswell, exhibited by the United States, Mounted Service school and ridden by Capt. Guy V. Henry, Thirteenth cavalry in competition with chargers mounted by uniformed army officers of England, Holland, Belgium, Canada and this country, was awarded the Plaza Cup, value $200. The second award, $75 went to Harmony, ridden by Col. P. A. Kenna, England, and third, $35, to Experiment, ridden by Capt. J. R. Lindsey, United States cavalry.

WHICH KIND?

To the American Breeder: What type of a jack produces the best mules? The kind of jacks we have in this country are about 12 or 13 hands high; short in body, fine boned and produce small, fine boned colts that weigh from 400 to 500 pounds at 5 months old. Some men tell me that the kind of jack to use is a long body, rather long neck, with good bone, from 14 to 16 hands; with round cannon bone and straight on their pasterns. There seems to be a choice for black jacks here. I know of one gray jack in my neighborhood that does not take well; that is the type last spoken of. He gets long, roomy colts with plenty of bone, too. Will some large experienced mule raiser tell in the next issue of the American Breeder what he knows about these two types of jacks as breeders.—A Nebraska Subscriber.

CASTRATING COLTS.

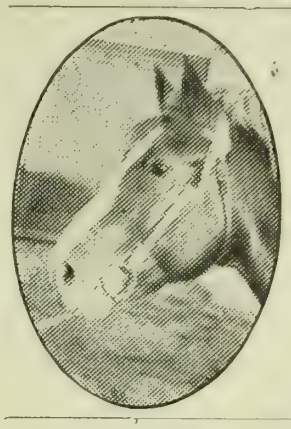
To the American Breeder:—In your answer to the question of castrating colts the first year, you omit one (to me) very important reason. That is, that penis is not enough developed to be serviceable when grown, and I think that they are more inclined to get foul than they would if left till they are more developed. I like to let them run as long as possible, and they do the work, for my experience is that a stag horse is tougher than one that never run as a stallion.

Wishing you the best of success with the best paper of its kind that is published, I am yours respectively, H. A. Thomas, Ada County, Idaho.

IRVINEDALE BELGIANS

Imported and home-bred stallions and mares. All ages. Prize winners and the produce of prize winners. Top quality at reasonable prices. Address,

CHAS. IRVINE,
ANKENY POLK COUNTY, IOWA.



Pioneer Stock Farm

The Home of the Belgians.

We have for sale the classiest bunch of imported and home-bred stallions and mares we have ever offered for sale. Got first premiums and grand championship in every class we showed in at two state fairs; eight firsts and two grand championships at Oklahoma City and six firsts and two grand championships at Hutchinson, Kas. Any one desiring a first class stallion or mare will do well to see this fine bunch and get prices.

DAVID COOPER & SONS,
Freeport, Harper County, Kansas.

Belgian Emporium of America

Largest and best collection of Belgians to be found anywhere in America; 150 head stallions and mares, either imported or bred by me. All colors; ages one to five years.

In order to accommodate Belgian customers wanting a Percheron, I have imported a car load of young black and gray Percherons of best quality. Illustrated catalogue free. Fairfax is 8 miles from Cedar Rapids, Ia., on C. & N. W. and on C. M. & St. Paul. Cedar Rapids and Iowa City Interurban passes 3 miles from farms. If coming on it, phone for auto to meet you at Lefebure Crossing.

H. LEFEBURE,
Fairfax, Linn County, Iowa.

BURRESS BROS.

Breeders of Percheron and Belgian Horses.

We have some good, big boned draft stallions for sale of all ages. Our horses are pasture raised and acclimated.

We showed our horses at Nebraska and South Dakota State Fairs and the Interstate Fair at Sioux City, Ia., 1912, and won eighteen prizes.

We still own, and are breeding, the imported mares that we won first and sweepstakes on at Nebraska State Fair in 1908. We also have some good, big, high grade colts that will make ton horses.

Write us, or come and see our horses before you purchase. Barns in town. Carroll is located on the C., St. P., M. & O. Ry., sixty miles west of Sioux City, Ia., and 120 miles west of Omaha.

Reference—First National Bank, Carroll; Citizens' National Bank of Wayne.

Burress Bros., Carroll, Wayne County, Nebraska.

Imported Belgian Stallion

For sale; coming six years old; sound an dall right; weight 2300 pounds; is not fat, just in good breeding order; gets 80 per cent of his mares in foal; have lots of colts to show. **Fred Eggimann, Annawan, Henry County, Ill.**

STALLIONS, MARES AND A JACK.

One six-year-old and two two-year-old stallions, registered in Percheron Society of America. These horses are built right. You will be pleased with them. Want to sell one; take your choice. Also four brood mares and one weanling filly, registered as above. Want to sell two, take your choice. Have bred Percherons for six years. Also one black jack with light points; 5 years old. Will price him right for cash, or will trade him for other property. Write for particulars. **H. M. Stephens, Munden, Republic County, Kansas.**

IMPORTED BELGIAN

For Sale or Exchange.

One imported Belgian: color, chestnut; 12 years old; weighs 1900 pounds; 16½ hands high. Our reason for selling is that his fillies are in his way. Will sell this horse reasonable, or exchange him for another. **Sauer Bros., Sanborn, N. D., R. F. D. 2, Box 39.**

Stallion Laws of Three States

INDIANA STALLION LAW.

The owner of any improved stock sire who desires to charge a service fee for such sire may file with the county clerk of any county or counties in this state, in which such sire is kept for service, a sworn statement which shall give the name, age, description, breeding and pedigree of such sire, and if registered in any herd or stud book, his number and volume of said registry and the clerk shall thereupon issue to such owner a license which shall embody said sworn statement under his hand and official seal, authorizing such owner to keep such sire for service in such county or counties, and charge therefor such fee for service as the owner of the dam may agree to pay, and such clerk shall be entitled to charge and receive a fee of 50 cents, and no more, for taking and filing such sworn statement and issuing such license.

A copy of such licenses embracing such sworn statement and pedigree, with the fee the owner proposes to charge for service, shall be posted by the owner of such sire or sires in two or more conspicuous places, in the vicinity of the place where such sire is kept for service, and should any part of said sworn statement be, to the knowledge of the owner of such sire, false in any particular, the owner shall not be entitled to collect any fee for such service and the falsity of such statement, or any part thereof, may be pleaded in bar to any contract or account for services of such sire.

The owner of any sire, who having complied with the provisions of this act and obtained such license and posted the same as herein required, may have and obtain a lien upon the get of any such sire, for the amount of the fee agreed upon for such service, or if no note or written agreement is made then for the amount of the advertised fee charged for such service, which lien shall date back to the time of the rendition of such service, and run for two years from the date of such service; provided, however, that said lien shall not be valid as against any innocent purchaser of such dam unless the person entitled to said lien shall, within one year from the rendition of such service, file in the office of the recorder of the county where the owner of said dam resides, a written notice containing a description of said dam, the name of the owner, the name of the sire and the name and residence of his owner, the date of said service and the amount due for the same, together with any written contract which may have been made at the time of the rendition of such service, and the filing of the same shall be notice to all of the existence of such lien, and such lien may be by suit before any justice of any township in this state where such get may be found at any time within 12 months from the date of the filing of such notice, but not afterwards.

It is hereby made the duty of the recorder of each county in this state to provide and keep in his office a book wherein he shall record the notice provided for in Sec. 3 of this act, and for the recording of each one of said notices the said recorder shall be entitled to receive the sum of 25 cents, to be paid him by the person filing the same in his office, and upon the payment of the fee or price of such service, the owner of such sire shall acknowledge payment thereof, in writing, upon the face of said record, which said acknowledgement shall be attested by the said recorder who shall receive therefor a fee of 10 cents.

If the price of said service be not paid at the expiration of the credit given therefor the person entitled to the same may enforce the same by suit before such justice, and a certified copy of such notice, under the hand and seal of such recorder, shall be sufficient complaint in a suit before such justice of the peace to enforce such lien, and should the owner of the dam fail to pay the judgment rendered by such justice for such service, the get of such sire shall be sold on execution, without relief from valuation or appraisement laws to satisfy such judgment.

Any person having bred a dam to such sire who shall sell or dispose of the same, knowing such fee to be due and unpaid and without making any provision for the payment of the same and to avoid the lien created by this act, or who shall run off, or in any wise conceal the get of such sire with intent to cheat, hinder and defraud the person entitled to said lien, or with intent to prevent a sale of such get for the payment of said lien, as in this act provided, or who, owning any dam shall falsely and fraudulently represent that she has been bred to any improved sire other than the one she has actually been bred to, for the purpose of inducing anyone to buy or trade for such dam, shall be deemed guilty of a misdemeanor, and on conviction thereof may be fined in any sum not exceeding $50.

MICHIGAN STALLION LAW.

The owners or keepers of any stallion shall have a lien upon the mare served by any such stallion in breeding thereof for the amount of the service fee according to the terms of the agreement under which said mare is bred; such lien shall continue for the period of 18 months after the date of such service, and shall also have a lien upon the get, if any, by such stallion for the amount of the service fee of such stallion, and such lien shall continue for the period of six months after the birth or foal of such get.

The owner or keeper of a stallion in order to obtain and perfect such lien shall require the owner of such dam to sign a contract in substantially the following form:

This agreement made and entered into by and between ..... first party, of.....Michigan and .....second party, of..... Michigan, owner of dam described as follows: Name ..... age ..... years, color.....weight .....pounds, and served this day by said stallion. Service fee $.....due To insure service fee $.....due..... First party shall have a lien on the mare for such service fee for a period of 18 months from this date and shall also have a lien upon the get of said stallion, if any, for such service fee, for a period of six months after the birth or foal of such get. Second party to have return privilege for the season as follows.....The lien herein provided shall be enforced by the seizure of the property and the sale thereof after like notice as required by law for constable's sales. Such seizure may be made at any time when first party may deem himself insecure, or if the owner of said dam or colt shall sell, assign or dispose of, or attempt to sell, assign or dispose of the property, or remove or attempt to remove the same from the township of ....., county of .....Michigan. The sale may be made at any time after such seizure and the giving of the notice as herein provided.

In witness whereof the parties hereto have this.....day of..... A. D., ..., subscribed their respective names.

The lien herein provided shall not be valid as against a subsequent bona fide purchaser unless the owner or keeper of such stallion or his assign shall, after such service and before a bona fide sale of such mare or colt, file with the township or city clerk in the township or city wherein such property is owned or kept the contract or a true copy thereof as entered into by the owner or keeper of said stallion and said dam and shall pay to the clerk the sum of 25 cents as a filing fee. The lien as between the parties to the contract shall be absolute without any filing of such contract.

Such lien may be enforced by the owner or keeper of such stallion, or by any person to whom such debt may be assigned, by seizure and sale of the colt or mare, or both, mentioned in said lien, or so much thereof as may be necessary to satisfy said debt, and also the reasonable expense of such seizure and sale, returning the residue, if any, to the owner of such colt or mare. Such seizure and sale to be made according to the provisions of this act; provided, that no recovery can be had for the services of such stallion where the owner or keeper thereof has wilfully or fraudulently misrepresented the breeding of such stallion.

Act No. 166 of the public acts of 1905 and all acts in conflict with the provisions of this act are hereby repealed. Approved June 17, 1907.

WASHINGTON STALLION LAW.

In order to secure to the owner or owners of sires payment for services, the following provisions are enacted: That every owner of a sire having a service fee, in order to have a lien upon the female served, and upon the get of any such sire under the provisions of this chapter for such service, shall file for record with the county auditor of the county where said sire is kept for service a statement, verified by oath or affirmation to the best of his knowledge and belief, giving the name, age, description, and pedigree, as well as the terms and conditions upon which such sire is advertised for service: Provided, that owners of sires who are not in possession of pedigrees for such sire shall not be debarred from the benefits of this chapter.

The county auditor, upon the receipt of the statement as specified in the last preceding section of this chapter, duly verified by affidavit, shall issue a certificate to the owner or owners of said sire, which shall be posted by the owner in a conspicuous place where said sire may be stationed, which certificate shall state the name, age, description, pedigree, and ownership of said sire, the terms and conditions upon which said sire is advertised for service, and that the provisions of this chapter, so far as

Advertising Results Uniformly Good

Every one of the draft horse breeders and importers who have used the American Breeder in their sale advertising have had good results. The following letter from Mr. Decker represents a fair average of all reports:

To the American Breeder: Enclosed please find check for our sale advertisement. We got good results from the ad in the American Breeder. We received a great many inquiries for catalogs, mentioning the American Breeder. We have mailed you marked catalog of the sale, and assure you that when we have anything more to sell we will use the American Breeder.—J. H. Decker, Piper City, Ford County, Ill.

relates to the filing of the statement aforesaid, have been complied with.

The owner or owners of any such sire receiving such certificate, by complying with the last two preceding sections of this chapter, shall obtain and have a lien upon the female served for the period of one year from the date of service, or upon the get of any such sire for the period of one year from the date of birth of such get: Provided, said owner or owners shall file for record a statement of account, verified by affidavit, with the county auditor of the county wherein the service has been rendered, of the amount due such owner or owners for said service, together with a description of the female served, within six months from the date of service or date of birth, as the case may be: Provided further, that the lien upon the get of any such sire shall be a preferred lien.

Liens under this chapter are to be foreclosed in the same manner as liens upon other personal property are foreclosed.

For filing certificate, making copy of such affidavit, and the certificate of date of such filing, the clerk of record shall be entitled to the same fees as are provided by law for similar services in regard to chattel mortgages.

White Oak Stock Farm

American bred, Percheron stallions and mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to **D. Augstin, Carlock, Ill. R. F. D. No. 2.**

QUESTIONS AND ANSWERS.

(Continued from page 5.)

horse to its original owner and bring proceedings, not only for the full purchase price but for all other damages and expenses. Employ a good, honest lawyer that has been successful in winning his cases. Try to employ one on a percentage basis so that he will be anxious to get the case settled with as little delay and cost as possible.

MASTURBATION—I have a jack 7 years old; have owned him three years and when I got him he was spoilt to jennets; the first year he would not serve at all; the second year I used a jennet to start him with; bred him to twelve mares; got one colt; third, or this year, I have bred him to about twenty-five mares and have not used a jennet at all and he has been a good performer; is a little slow at times; about all the mares bred this year seem to be with foal, but he has the habit of masturbating. I am using a leather whang on him and would like to know if it would be advisable to keep it on him all winter. Do you think he will ever be a sure breeder? I have a 3-year-old Percheron stallion forming the same habit but he lacks exercise, but I am going to work him this winter. I have bred him to about fifteen mares and think they are all with foal. Would it be advisable to use a whang on him this winter?—New Mexico Subscriber.

REPLY—Masturbation is one of the difficult problems in horse breeding. Your difficulty should be a great lesson to the owners of valuable breeding stock. A preventive is much better than any remedy we can give. The preventive is not to allow a young stallion or a jack to use a paddock for exercising purposes, or in any other place where mares have been bred. Do not allow them to remain in the same barn or where mares in heat can be seen or smelled. Do not use them for teasers. The same instructions should be used with jacks pertaining to jennets. A whang leather ring is probably as good and cheap as anything that can be employed, but it should be moved frequently in order to prevent any irritation on the penis. The fact that you have two animals which are practically ruined should be evidence that you should change your method of handling this kind of stock.

A SLOW TEASER—I have a draft stallion 8 years old; weighs 1,800 pounds; he is a slow teaser and very easy about it; if a mare is not in right good heat he acts like it discourages him, and would just as soon go back to his stall. Will you kindly give me a remedy for this.—Missouri Subschiber.

REPLY—You should not be discouraged about a stallion of this kind. Mares that are not in good heat should not be bred, and the chances are that this stallion is a very sure foal getter. A stallion of this kind is much more satisfactory as a teaser than a very rank individual. A great many mares are bred while pregnant. If you are not quite satisfied with an occasional mare, tie her near the stall of this stallion where she may be unmolested; the bridle and harness should all be removed, leaving her perfectly quiet. If she has a natural heat period she will usually show sufficient signs after a reasonable length of time. It is a mistaken idea that a stallion should be rank and severe.

WARTS—I have a 3-year-old colt that has three warts about the size of goose eggs. What can I do to cure or take them off?—South Dakota Subscriber.

REPLY—Growths of the size you mention are best removed by surgical measures and you should employ a good competent veterinarian for this purpose, inasmuch as the operation is usually attended with considerable hemorrhage.

CHRONIC LAMENESS—I have a 4-year-old mare which has been lame for four or five months. She stands perfectly, but in moving she is lame both in front and hind parts. She may trot along on a smooth surface and not limp any, but if she sets her foot on a twist or out of level she goes lame for a little ways at least. Some days she is worse than others; there are no signs of side bone whatever. There was a party told me she had been taken out of pasture when very soft and driven sixty-five miles and that was the first time she had ever showed any lameness, and had been lame ever since. She is no worse in driving a distance than in just starting. If anything, she is better. In driving fifteen or twenty miles the following day she lays around all the time resting; in two or three days she rests all right standing. This is a fine little mare and I hate to let her go. What do you think can be done to cure her?—Indiana Subscriber.

REPLY—The manner in which this

31
PERCHERONS

Must Be Sold at Once

We have sold our farm, and must give possession January 1st, 1913 This makes it necessary that we should sell our Percherons, the result of many years of intelligent breeding.

We are offering for quick sale, 18 Brood Mares; 12 Stallions, coming three years; and one Stallion coming four years. These Mares are among the best in America. The Stallions are mostly the get of Alban 46137 (64433).

Come and see these Grand Percherons, or write for list.

PATTERSON-ERICKSON CO.

Worthington, Nobles County, Minnesota

IMPORTED PERCHERON AND BELGIAN

20 REGISTERED PERCHERON

stallions and mares for sale; might exchange for other stock. **J. D. Putman, Saline, Mercer Co., Mo.**

case of lameness was brought on causes us to think she is troubled with chronic laminitis. We would suggest if you do not have an opportunity to have her examined by a good veterinarian that you soak her forefeet, or for that matter all the feet, for several hours daily in cold water for three or four days and then apply the following about the coronet allowing it to extend upwards from the hair line about two inches: Powdered cantharides, one ounce; vaseline, three ounces. Mix together and after clipping the hair from the parts rub in the ointment well with the fingers for several minutes. This agent will blister and should be allowed to remain on for twenty-four hours, at the end of which time it should be removed with warm water and soap, and the parts oiled occasionally afterward. The blistering may be repeated in about three weeks. The animal's head should be kept tied up while this blister is on so that it cannot reach the parts.

INJURED STIFLE—I have a full blood Percheron colt that got his stifle capped through some unknown cause, and would like to know a cure for it. It slips out and in as he trots or runs and is a little filled below the cap; has been done four months. I have consulted two veterinarians about it but am not satisfied with their treatment, as one is just the opposite from the other.—Illinois Subscriber.

REPLY—We should not be expected to advise where our patrons already have veterinary services for the reason that a qualified veterinarian who is on the ground and has an opportunity to closely examine and study the case should be in a position to give more valuable advice than one not afforded these privileges. In a general way these cases are best treated by applications of vesicants to the affected parts with restricted exercise. A roomy box stall would serve the best in which to confine an animal of this nature while being treated.

THIN MARE—I have two 4-year-old mares; they raised mules last spring; they worked pretty hard but were well fed and taken care of. I have had the mules weaned for a couple of months or so and they do not seem to pick up like they ought to; think probably they have some worms; I thought perhaps I fed them too high on corn while I was working them so hard; fed them nine and ten ears of corn and a half gallon bran apiece three times a day. Please tell me what you think would be a good feed for them; they are hearty to eat and seem to feel all right but do not pick up in flesh like I think they should, as I am not working them hard now.—Indiana Subscriber.

REPLY—We fear that the combined effect of hard work and nursing mule colts on mares that are only four years old, together with the fact that they may at this time be carrying young again, has been a little more than they could withstand and their recuperative power has been forced to a low point. You should by all means attempt to restore their vital forces by feeding them liberally on nutritious food such as clean, bright, heavy oats, oil meal, a little bran and good hay, together with plenty of grooming. They should be worked only moderately and thus be given an opportunity to build up before protracted cold weather is at hand.

SKIN ERUPTION—I have a young healthy mare that broke out with some kind of an itching last fall and this fall. What do you think is the cause of it and what would you suggest as a cure for it?—Oregon Subscriber.

REPLY—These periodic skin eruptions are usually of the nature of eczema and are inclined to be rather obstinate in responding to treatment. We refer you to a similar inquiry under another head which if followed will usually secure relief in a few weeks.

HORSE THIN IN FLESH—I have a 5-year-old driving horse that does not pick up in flesh. His feed is two quarts of oats, one ear of corn, one quart of bran and good timothy hay three times a day; he is a good feeder but don't pick up in flesh. Did not have good pasture this summer but fed him corn and bran all summer; commenced feeding oats about three weeks ago; horse is in good condition.—Ohio Subscriber.

REPLY—We fear you are not feeding your animal sufficient to cause him to gain if you are using him a reasonable amount, and this, in view of the fact that he was on short pasture during the summer. Increase the quantity of oats and corn without increasing the bran and give him a thorough grooming daily. Should he not show improvement in a few weeks have a veterinarian examine the condition of his teeth.

FEEDING CANE—Do you think I could feed a young jack too much cane?—Missouri Subscriber.

REPLY—We do not think you should restrict valuable breeding stock to a full diet of cured cane. This forage crop is valuable for nearly all stock, especially milk cows, but should not be used as exclusive roughness, especially in such cases as you mention.

SKIN AFFECTION—Will you tell me how I can best overcome a skin or blood trouble of which my horse is affected. On the withers and side of his shoulders he has a breaking out of bumps or large pimples, reaching from his withers down the sides of his shoulders. The skin on this part is dry and full of something like dandruff. This trouble has appeared on this horse two or three times in the last two years; the rest of his body always remaining in a normal state. Up to this time I have been able to overcome the trouble but on this occasion I have used all the old-time home remedies without results. This horse is only 8 years old; is sound and healthy in every other way; is fed oats and bran (no corn), the best timothy hay to be had; has plenty of good, clean water. When not used for driving he has the run of a small lot; his stable is kept clean; he is in good flesh and would eat the currycomb if I did not hide it from him. Please help me out and I will very much appreciate the favor.—Kentucky Subscriber.

REPLY—Apply the following to the

LAMER'S
PERCHERON SALE

SALINA, KANSAS
Friday, Dec. 27, 1912

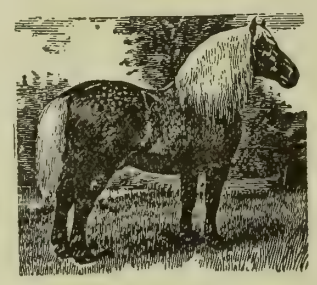
We will sell at Salina, Kansas, on Friday, December 27, 1912, fifty-seven (57) head of imported and home-grown Mares and Stallions, consisting of:

24 Mares (2 to 5 years old), in foal.
7 "Yearling" Mares.
12 "Suckling Colts."
10 Stallions (2 to 5 years old).
3 "Yearling" Stallions.
1 Imported Hackney Stallion.
And 2 Jacks.

This consignment of horses was very carefully selected by me during the past summer and I can say, without the least hesitancy, that they are as good, or better, a lot as will be offered at public auction this winter.

Our aged mares are all in foal by the best stallions in the country and I can assure you that I bought only the kind that would build up a reputation for myself and establish a foundation of a family of horses.

We also have 40 Percheron and Belgian stallions in the stables, from 2 to 5 years old, weighing from 1,700 to 2,100 pounds—that we are offering at private sale.



Date of Sale--Dec. 27, 1912

Write for Catalogue

P. S.: On the following day—Saturday, December 28, 1912—we will sell 100 head of grade Farm Mares and Mules.

C. W. LAMER & CO. Salina, Kans.

D. Augstin, Pres. C. W. Hurt, Mgr., Arrowsmith, Ill.

TWO DAYS DISPERSION SALE OF PURE BRED PERCHERONS

January 2d, sale at Lexington, Ill., F. W. Schwab sells 16 head consisting of 14 mares and fillies, and 2 stallion colts.

January 3d, sale at Pontiac, Ill., W. H. Welch sells 30 head, consisting of 23 mares and fillies, and 7 stallions from weanlings to 6 years old.

In both lots are some good mares bred to Apollon 26130 (42491), the great son of old Besique (19602); also some weanlings and yearlings by the same sire. Address for catalogues ready December 15,

FRED W. SCHWAB, Lexington, Ill., and W. H. WELCH, Lexington, Ill.

affected parts two or three times a day: Alcohol, 16 ounces, lysol, 2 drams; witch hazel, sufficient to make one quart. Mix and gently rub into the parts with a soft cloth saturated with the mixture. Also give one-half ounce of Fowler's Solution three times a day mixed with the feed.

EXPERIENCE WITH RUPTURED COLT.

To the American Breeder:—I notice in your issue of September 5 in your Question Department, where an Ohio subscriber asks for advice in regard to a navel rupture on a fine colt. I would advise a belt or a band 5 to 8 inches wide, made from bed ticking or drilling and a piece of leather the width of band so as to keep it from rolling up and keep it in place; attach a buckle and straps so as to adjust the size and buckle it on so as to place the leather directly over the rupture, and it will be but a short time until the colt is as smooth as any colt. I am speaking from experience. —L. P. Taylor, Logan County, Ohio.

A SUCCESSFUL COLT SHOW.

To the American Breeder:—I can report success of a colt show held at my breeding barn, instead of failure (as a brother reported in a recent issue of this paper).

I offered for prizes $10 for the best; $3.50 for second best; three years' subscription to this valuable paper (the American Breeder) for the third best, and one year's subscription for the fourth. The same prizes were awarded in each of two different classes—draft colts and mule colts. I happened to have the best draft colt, so I gave the prizes to the next four in order. All competitors seemed to go away satisfied. The sire of the mules died last fall, but through the medium of this paper I bought a much better one. I had posted at the barn charts furnished me at the Scientific Breeding School, and I also found that it was a good time to obtain subscriptions for this paper. I present herewith a picture of some of the prize winning colts.—Wm. H. Young, Sedgwick County, Kansas.

PRIZE WINNERS IN MR. YOUNG'S COLT SHOW, SEDGWICK COUNTY, KAS.

MINNESOTA HORSES AND MULES.

The number of horses and mules in Minnesota, April 15, 1910, when the last United States census was taken, aggregated 757,836, according to figures recently announced. The total number of horses and colts reported was 752,071. Of these, 674,497 were classed by the census as mature horses, and their value averaged $125.50. Yearling colts, which are colts born in 1909, numbered 62,990, and their average value was $60.90. Spring colts, born in 1910, were 14,584 in number, and their average value was reported as $30.80. Only 7.8 per cent of the farms of the state reported colts born in 1910.

The total number of mules of all ages in 1910 was only 5,765, which is eight-tenths of the number of horses and colts. Of these, adult mules numbered 5,203, and their average value was $133.80. Only 118 mule colts, born in 1910, were reported, their average value being given as $35.55. There were 444 yearling colts, born in 1909, and their average value was placed at $70.

Value of all horses and mules in the state was $89,661,000, mules being worth only $731,000. The value of all horses increased 110.5 per cent in the decade.

INTERNATIONAL STOCK SHOW.

(Continued from page 8.)

second, Lupton on Peter Pan, Gazello, Chestnut Prince and Juletta; third, Lupton on Valor, Me-En-Gau, Candy Kid and Princess Thyra.

Pony Under Saddle—First, Dick D. Simpson on Ross.

Fat Cattle—Single Animals.

The big, well balanced showing of fat steers (with an occasional Freemartin heifer) is really the chief distinguishing feature of the International's cattle exhibit. We have already chronicled this year's winning of the steer grand championship by the Canadian grade Angus (practically a pure bred). It was talked before the show that the Shorthorn steer calf that won championship for its age was the strongest competitor, but this proved not to be the opinion of the English judge, who had the last word, as he made the two-year-old grade Angus the champion, and a yearling grade Angus (champion for its age) was given the reserve position. The regular breeding class judges made the awards in pure bred steers, but the English judge, Robert H. Keene, judged the grades and crossbreds, and then from first prize winners selected by the others and himself he selected the grand champion. Awards in full are as follows:

Grades and Crossbreds.

Steer Calved Between Jan. 1, 1910, and Sept. 1, 1910—First, McGregor on Glencarnoch Victor; second, Tow on Lant; third, Leask & Sons on Roan Champion; fourth, Iowa State Agricultural College on East Riverside Prince; fifth, Grosch on Blue Jay.

Steer Calved Between Sept. 1, 1910, and Jan. 1, 1911—First, University of Nebraska on Cornhusker; second, Iowa State Agricultural College on Queen of Hearts; third, University of Missouri on Disputer; fourth, Bunnell on Sensation; fifth, Miller on Patrick King.

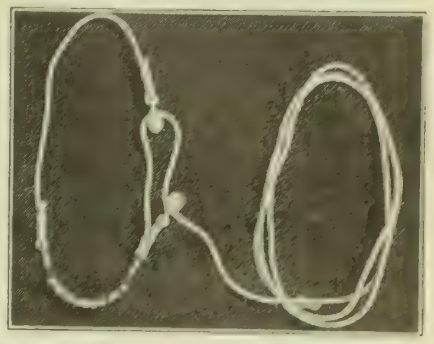
Steer Calved Between Jan. 1, 1911, and Sept. 1, 1911—First, Iowa State Agricultural College on Blackrock 2d; second, Iowa State Agricultural College on Pete; third, Huffman on Colonel; fourth, Anderson & Sons on Jinx; fifth, Huffman on Joe D.

Steer Calved Between Sept. 1, 1911, and Jan. 1, 1912—First, McGregor on Glencarnoch Boy; second, Ohio State University on Ohio's Highlander; third, Iowa Agricultural College on Queen of Diamonds; fourth, Saunders on Roan Goods; fifth, Tudor & Son on Bonner's Lass.

Steer Calved Since Jan. 1, 1912—First, Iowa State Agricultural College on James; second, Kansas State Agricultural College on College Mina 2d; third, Tow on At Last; fourth, Anderson & Sons on Pansy; fifth, Anderson & Sons on Bill.

Champion Steer—McGregor on Glencarnoch Victor.

"CONQUEROR" STALLION BRIDLE



GUARANTEED TO HOLD ANY STALLION OR JACK.

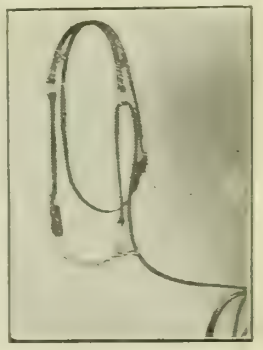
Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.



Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

Get of Sire—First, Cudahy; second, Harris; third, Curtice; fourth, McCray; fifth, Luce & Moxley; sixth, Tow.

To the American Breeder: W. M. Jardine, now head of the farm crops department at the Kansas Agricultural College, has been appointed by the board of regents acting director of the experiment station and dean of the division of agriculture. Mr. Jardine will succeed E. H. Webster January 1.

George K. Helder, for several years assistant at the experiment station at Hays, has been appointed superintendent to succeed A. M. Ten Eyck. Mr. Helder's appointment to this important position should be an encouraging proof that "the man on the job" gets what is his. In speaking of Mr. Helder's selection, President Waters said, "On three occasions when matters of great importance had to be handled at the western Kansas experiment station, it chanced that Mr. Helder was acting superintendent in the absence of Mr. Ten Eyck. He always made good. This fact and his general ability to manage the business affairs of the station, entitled him to the promotion."—Charles Dillon, Kansas Agricultural College.

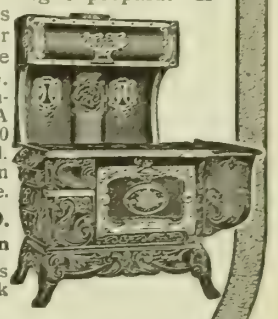
A New Stove SURE When You See Kalamazoo Prices

Don't let the dealers' high prices keep you from the enjoyment of a new stove this fall. We make *the very kind you want* among our 400 styles and we'll beat your dealer's price or any middleman's price $5.00 to $40.00, according to what you need. You'll be surprised to find that the Kalamazoos—*acknowledged* the finest stoves made—are sold at prices no one else can approach. The largest factory in the world dealing direct is the reason. Two hundred thousand delighted customers—one or many in nearly every town, is the proof. See testimonials in book or write for names and addresses near *you*. And prices have been reduced still lower.



Free

WRITE for Free Book—Free Trial—360 Days' Test—Low Factory Price—Freight Prepaid—Cash or Credit

There is no other stove after all like the Kalamazoo. Write us a penny postal to satisfy yourself. If we didn't give what we promise this magazine wouldn't publish this advertisement. And by our plan you select on your *own* judgment, from big, perfect photographic illustrations, choose the *style* and *price you want*. And stove or range is shipped *the day we get your order*, freight prepaid. If disappointed after a month's trial, return and get your money at once—or any time within a year if flaws develop. Read the legally binding guarantee in free book. Write us *now*. A better stove and $10.00 or $20.00 saved is worth a penny postal. Ask for Catalogue No. 690. When writing mention this paper please.

PRICES FOR FAT SHOW STEERS.

The sales of show cattle at the International was disappointing to many exhibitors. Although the prices might seem good to a novice, in many cases they did not cover the extra cost of special care and feed and the (sometimes rather high) initial cost of the animal. The grand champion steer brought only a little over half as much per pound as did last year's champion, which brought 90 cents per pound. This price was justified by its advertising value, as the big department store which bought the champion steer last year, was the buyer of this and lacked only the competition, to have reached last year's level.

The next highest prices were $17.75 paid for a 1,260-pound Hereford, $15.25 paid for a 1450 pound Shorthorn and $14.25 for a 1330 pound Angus. A 1600 pound Hereford sold at $14.00, the same figure as that paid for the champion car lot, as good a bunch as ever came to a fat stock show. From $14.00 the car lot prize winners sold down to $10.60. Single steers (Red Polls) that had won in class, sold as low as $9.25. In many cases the packers who bought had contracts already, for the steers, at a good advance, and it was the general belief that none of the buyers would have to charge anything to advertising, the fancy Christmas trade being good enough to take all the beef at a fair profit.

At the figures we have indicated about 60 car loads and about 120 single steers, all of which had been on exhibition, were sold.

ASSOCIATION CATTLE SALES.

At the sales of registered breeding cattle, held under the auspices of various record associations during the International, fair improvement over last years interest, was shown. In the Shorthorn sale $11,315 was realized on 40 head, the bulls averaging about $335 and the females nearly $75 less per head. The top price paid was $710 for a yearling bull.

The Hereford sale made an average of $325 on 36 head, the sale total being only slightly more than for the Shorthonrs. Bulls and females averaged nearly the same in this sale, about $330 and $320 respectively. The top price was $1,000 for a cow that went to Canada, while two bulls sold above the Shorthorn top, at $975 and $725.

The Aberdeen Angus sale was between the Herefords and Shorthorns in total but way below in average, the 66 head sold going at about $170 around. Bulls averaged lower than females by about $15.

A GOOD BULL FOR INCREASING CATTLE VALUE.

To the American Breeder:—It has been demonstrated again and again that the cheapest investment that can be made by a farmer who is trying to build up the standard of a herd of cattle lies in the purchase of a good pure-bred bull. It is not necessary to buy several high-priced females as a basis for the average herd, nor is it economical. The most economical results can be obtained by buying a bull with masculinity enough behind his good breeding to stamp his likeness upon the calves secured.

A striking proof of this has been shown on the cattle show circuit at various state fairs this fall. One of many instances will suffice. Recently a prominent state fair judge had to choose between two cows with the same dam, but sired by different bulls, for the female championship of the breed. So strikingly similar in type was each of them to its own sire, though the dam was the same, that there was no trouble in distinguishing between the two. The one that had been produced by the more outstanding sire was so superior to the one that had been produced by the less superior bull that there was no trouble about the selection.

The principle illustrated is of practical value to the farmer who is thinking of beginning a herd with limited capital, or who has a very common herd that he desires to grade up. An average group of calves will be far superior to their commonly bred mothers if a good pure-bred bull is used. Such a bull can be purchased very reasonably if proper care is taken by the purchaser.—Ray P. Speer, Minnesota College of Agriculture.

ANNUAL MEETING OF RECORD ASSOCIATIONS.

During the International Live Stock Show in Chicago a number of live stock record associations hold their annual meetings and elect officers for the ensuing year. In the following paragraphs we name the newly elected officers for several of these associations:

The Belgian Horse Association—President, Henry; vice president, Geo. R. Crouch; secretary treasurer, J. D. Conner, Jr., Wabash, Ind.; directors, J. Crouch, Indiana; Samuel Bell, Ohio; Eli Springer, Illinois.

American Shetland Pony Club—President, G. A. Heyl; vice president, W. A. King; secretary treasurer, Julia M. Wade, Lafayette, Ind.

Shorthorn Record Association—President, F. W. Harding, Waukesha, Wis.; vice president, J. F. Hovencamp, Ft. Worth, Tex.; secretary, Roy S. Groves, Chicago; manager, Abram Renick, Chicago; new and re-elected directors, C. A. Otis, Ohio; Dan S. Combs, Tennessee; Benjamin C. Allen, Colorado; E. R. Sullivan, Iowa; F. W. Harding, Wisconsin, and John R. Tomson, Kansas.

Polled Durham Association—President, W. R. Moorman, Jr., Kentucky; secretary treasurer, J. H. Martz, Ohio; directors, W. R. Moorman, J. H. Miller, Indiana, and H. R. Williams, Iowa.

PARCELS POST RULES AND RATES

In Effect January 1.

The parcels post law, which goes into effect January 1, is perhaps one of the most discussed laws ever passed, and one which will affect, as well as interest, nearly everybody.

Nearly everything that doesn't weigh more than eleven pounds and that can be tied with a 72-inch string going both ways around can be shipped. Intoxicants, poisons, inflammable materials, revolvers, animals (alive or dead), obscene printed matter and articles which violate criminal acts are tabooed. However, there are exceptions on the taboo list. One may mail a live queen bee and other insects if properly caged, or a stuffed animal. Poisons to be used as medicines are admissible.

Here are some of the regulations:

Distinctive stamps will be used on parcels post packages—stamps not good for any other class of mail.

Packages must be wrapped so that the contents may be examined easily.

Packages will not be accepted unless they bear the name and address of the sender preceded by the word "from."

Inscriptions such as "Merry Christmas," "Happy New Year," "With best wishes" and "Do not open till Christmas," may be placed on the covering.

Fragile articles must be labeled "fragile," and perishable articles "perishable."

Eggs must be packed against any possible chance of breakage and must be labeled "eggs."

Fresh meats will not be accepted for shipment beyond the first zone.

Perishable matter decaying in transit may be destroyed by postmasters.

Perishable matter which may decay before it reaches its destination may be given to charitable institutions by postmasters.

A parcel may be insured against loss in an amount equivalent to its actual value, but not to exceed $50, on payment of a fee of ten cents.

Addressees must sign a receipt for insured mail.

Parcels post matter will not be admitted to registered mail.

Parcels post matter comes under the head of fourth class mail matter and all present fourth class regulations conflicting with parcels post are superseded.

Here are the rates by zones:

	First lb.	Each addit'l lb.	11 lbs.
Rural route and city delivery.	$0.05	$0.01	$0.15
50-mile zone	.05	.03	.35
150-mile zone	.06	.04	.46
300-mile zone	.07	.05	.57
600-mile zone	.08	.06	.68
1,000-mile zone	.09	.07	.79
1,400-mile zone	.10	.09	1.00
1,800-mile zone	.11	.10	1.11
Over 1,800 miles	.12	.12	1.32

The following table shows parcels post charges as compared with express charges on a 5-pound package:

	Parcels post rate.	Present express rate.
City and rural route...	$0.09	$0.25
50 miles	.17	.25
150 miles	.22	.35
300 miles	.27	.45
600 miles	32	.50
1,000 miles	.37	.60
1,400 miles	.46	.75
1,800 miles	.51	.75
Over 1,800 miles.....	.60	.80

GALLOWAY OFFICES TO CARROLLTON, MO.

Authority to temporarily move the office of the Galloway Cattle Record Association was granted to Secretary R. W. Brown at the last annual meeting held in Chicago. At this meeting the old officers were elected for another year. G. E. Clark, Topeka, Kas., is president; C. S. Hechtner, Chariton, Ia., vice president, and R. W. Brown secretary. C. S. Hechtner, J. C. Ewing of Ohio and Isaac Lincoln of South Dakota were elected directors. The executive committee remains the same as last year. G. E. Clark was elected to succeed A. M. Thompson of Missouri as director on the American Royal board to represent the interests of the Galloway association, and Judge J. C. Ewing of Ohio was elected to fill the unexpired term of R. W. Brown on the same board.

HIGH CLASS REGISTERED

For richness of breeding and depth of Polled blood our herd cannot be surpassed, as we have used only the best Polled bulls obtainable for the last fifteen years. For catalogues write to.

ACHENBACH BROS., **WASHINGTON, KANSAS**

Do not Fail to Mention the AMERICAN BREEDER.

A PROVEN PLAN FOR CURING PORK.

Prof. H. S. Mobley, Fayetteville, Arkansas, has used for years a system of curing meat that has been followed with success in his family in Virginia from generation to generation since colonial days. It has been tested by hundreds of people in many southern states and every one has found it more reliable for home curing than any other method. Professor Mobley has furnished his method to the Agricultural Department of the Rock Island Lines for distribution.

A day should be selected for killing when the temperature is low enough to insure a thorough cooling by the following morning, the hogs being dressed and hung over night.

On the morning of the day the hogs are killed, for each 400 pounds of meat make a brine as follows: 20 gallons of rain water; 30 pounds of salt; 8 ounces of baking soda; 10 pounds of brown sugar; 1 gallon of molasses (use good molasses, not the adulterated kind). This fluid should be boiled and skimmed in the morning and left to cool in a shady place. When cool, add 5 ounces of saltpeter. Dissolve the saltpeter in warm water and stir into the other mixture thoroughly.

The following morning cut up the hogs as usual, and pack in barrels. Put the sides of the meat or middlings in the bottom and the shoulders next, and the hams on top of these, all with the skin side down. Weight the meat down well and pour the brine over until the meat is completely covered. Then cover the top of the barrel with some good thick covering that will prevent evaporation.

Look at the meat often enough to see that the brine has not evaporated so as to leave any meat exposed. If it should become exposed more brine should be added. The meat can be left in the brine indefinitely, but if it is desired to smoke the meat, it should be taken out in about six weeks.

Farmers who will use this method and cure their own meat at home, will save a neat sum each year.

AMERICAN BREEDER BOYS' CLUB

COLT EXHIBITION

Class for Boys 9 to 13 Years.

1st Prize—Marion Merkle, Iroquois Co., Ills.
2nd Prize—Chas. H. Ross, Greene Co., Ills.

To the American Breeder:—I want to tell you about my colt, Max. He is a dark gray Percheron; his mother is Inez 67717, and his sire is Iron 68442. They are both dark gray. Max was born the first day of June this year. He measures 54 inches high and his bone eight and a half inches, and measures 52 inches around his body. He has had no grain this summer, just runs in the pasture with his mother. I feed him cane and corn

MARION MERKLE AND HIS COLT. Both Born in June, But Ten Years Apart.

fodder. Max is a gentle fellow and never kicks; he likes to be petted. I will begin to feed him oats and clover hay soon, then wean him at about five months old. He will have a box stall in the barn with another colt named Bly; they will have a pen to run outside.—Marion Merkle, Iroquois County, Ill.

The leading specialists of the Department of Agriculture educate their assistants. The outside world wants them and pays more than the law permits being paid in the government service.—United States Department of Agriculture Report.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

NEVIUS' SHORT-HORNS AND POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, - CHILES, KANSAS

GOOD SHORTHORNS

Reds and Roans.

1 car load of bulls for sale.
1 car load of heifers for sale.
These are rugged, blocky, good feeders—the kind the country needs.

Sell your property quickly for cash, no matter where located; particulars free.—**Real Estate Salesman Co., Desk 9, Lincoln, Neb.**

320-ACRE FARM,

Well improved; for sale or trade for unimproved land.—R. J. McNEE, Idana, Kansas.

HY GEER IN ARKANSAS.

Amarekin Breeder, Hoss Papur, Deer Sur:—I shore had losst you this tiem—er myoanself, fer I reckon you ain't noad whare I am sence Mis. Geer an me left Pronax, Mo. An the childern. The childern air now fiev in number still. No moar sence the last wun. Two yeers ago. An the eldest two oaldest wuns air now aige, fiev an six yeers respeckfully.

But I started two tel how I loss trackt of you—meanin the bawld hedded edater that youred to do insied work moastly on the Br. Speshal and agen on the Roolarist its stil goan to Pronax we nevver cood get the address chainged. But as I wuz sain Mis. Geer moved us sellin our plais at Pronax to an Ioway man fer a suninlaw he diddent liek. She sed she wanted to git where I wuzzent in walkin distance ov a stoar and whare they wuz no stalk sails I cood waist my tiem at. I aint and thay aint. Ide ruther hunt fer the Kansas Stait Fare agen on foot than walk frum our plais to the neerest stoar.

I doant no hoo soald this plais to Mis. Geer but I aint no suninlaw ov hisn an thares no utther resin why he shuduv dun me thissaway. They aint no chanst ov reckreashun cept up at the still and them thare still fellers aint nun two soashable neather with a teetotaller liek me. The moast wun ov em ever sed two me wuz two shoot a turkle duv out ov a low branchin oke tree rite over my hed—an turkle duvs not hardly in seesin eather. Whut he sed wuz head "kilt two yaps acksidentally under that turkle duv roost awlreddy." And I dowt if it wuz a reglar roost eather.

But I started two say how I cum two no whare you wuz at. I met Mr. Cudd yure letcherer at Calico Rock an heaz the smartest man I ever noad. I cud (no joak) lissen two him letcher awl nite and whut Mis. Geer sed about reckennen I must a had a good seat haz nuthin to do with it. Ime glad yure with a hoss paiper (fer whitch I subscriebed fer through Mr. Cudd) as I liek hosses bettern cattel er yet hawgs—thay doant hav to be milkt or yet slopt. The hoss is the noblest wurk ov man an you can ried him an save walkin whut I learnt ov Mr. Cudd haz bin invallyable to me. To tell utthers. Mis. Geer sez she doant see whut call I hav to be steddyin sighentiffic hoss breedin owr oan hoss stock bein consisted ov a hoss mule an a work stear we got with the plais. Butt awl grate acheevments must hav a smawl beginin, so no moar at present.

Yures truely, HY GEER, Izard County, Ark.

FEWER DOGS, MORE SHEEP.

"I can not concede all things considered," says Secretary Coburn of Kansas in a recent address, "that the Architect of the Universe made on this round world of ours an equal area better adapted than Kansas to profitable sheep husbandry. The one detriment is worthless dogs, and this is the way we rise to the opportunity with which a kind Providence confronts us: In 1882 we had 806,000 sheep; in 1910 we had 175,000, a decrease of more than 78 per cent; in 1882 we had 129,000 dogs,; in 1910 we had 199,000, an increase of about 54 per cent.

These figures line with the experience of all the ages, which points out that no people whose land owners neglect animal husbandry, who sidestep the manure spreader, expectorate upon a sheep and deify the dog, can have any considerable, well grounded, permanent prosperity."

ALFALFA FOR SHEEP.

To the American Breeder:—I will say in answer to the inquiry from R. B. Anderson that alfalfa is one of the most valuable roughages we have in mutton production. It can be used to advantage with all classes of sheep, both in fattening and maintenance rations. Alfalfa pasture does occasionally cause sheep to bloat, resulting in small losses estimated at from three to five per cent. However, if care is exercised in turning the sheep on pasture, most of this danger is eliminated. If the sheep are well filled up when first turned into alfalfa fields and the dew has thoroughly dried off from the forage, danger is reduced to a minium. Alfalfa hay is used extensively in most of the great lamb feeding centers and is considered in the light of a necessity where cheap gains are desired.

Bromus inermus, or brome grass, as it is commonly called, is a valuable forage throughout the West and Northwest. It yields rather better than timothy and is higher in protein. You will find this grass makes a very satisfactory pasture where it can be successfully grown.—A. D. Faville, Animal Husbandman, University of Wyoming.

OKLAHOMA.

A few days ago the editor had the pleasure of visiting several sections in the great state of Oklahoma. Great changes have been made there during the past quarter of a century. No one realizes the extent of these changes better than the writer, who made the race in that most important of land openings. Take, for instance, the "Cherokee strip,' which was about 60 miles wide and 120 miles long—all of which was open territory and was entirely settled up in one day. Towns grew up with thousands of inhabitants in 24 hours; farms were put under cultivation in hardly longer time, and think of the population which has since been added as if by magic.

This population was all new to the country. Most of the new settlers proceeded to farm as they had farmed in the other sections of the world. Many of the farmers were not successful because they did not understand the nature of the new state. Some of those who had failed in the farming operations became despondent, which in a great measure resulted in laws being enacted that were not to the best interest of this progressive state. Some of the laws have been antagonistic to capital (while money draws a high rate of interest), and as a result the purchasing power of a dollar is great and few states offer equal opportunities for those who have money to invest.

In natural wealth and the advantage of location few states can match Oklahoma. Its coal, gas and oil fields would alone constitute riches, but its wealth in great areas of nearly virgin soil will in the long run prove even greater. Just far enough north to give it the freedom from insects and plant diseases which hard frosts help to bring, it is still far enough south for the long growing seasons, and many of the crops of the more southern states. No land is naturally more fertile than its valleys, while the grazing lands of the higher sections, interspersed with fertile valleys that grow alfalfa in abundance, make them ideal for recovering (on the better footing of improved blood) Oklahoma's former fame as the greatest live stock territory of the Union. Each year alfalfa, that greatest of the new crops, is being produced more extensively. A great deal of the land in Oklahoma produces also excellent cotton, wheat, corn, kafir corn and other small grains and grasses.

In some sections live stock is raised extensively. As farmers learn more of the possibilities of alfalfa, kafir corn and bermuda grass, cattle multiply where once the range was stripped to make way for farms. Horse stock does equally well and we predict that Oklahoma will be one of the greatest mule states in the country. A very large number of excellent stallions and jacks have gone from older states for service in Oklahoma, and the recent state fair and local fairs brought out great numbers of highly creditable native stock horses and mules. But many who know the state best, say that it will make its name in hog growing as much as in any one line. Even in the extreme western sections where alfalfa does indifferently, a perfect hog ration of peanuts and kafir corn has been grown, while the eastern part, with its corn and profusion of legumes, is established as a hog producing section.

Oklahoma's location, in the line of gulf traffic from the upper and central Mississippi valley and the great plains, has been largely responsible for a commercial growth that has had few parallels. The checking of this during the past year is nothing against its right to exist, for nothing can change the logic of Oklahoma's location. And the men who are holding their own, and the new ones who invest conservatively as the opportunities now are offered will realize the truth of what we have said.

JENNETS.

At this time of year many jack and jennet colts will be weaned. This young stuff must be fed liberally and the jack colts should be separated at weaning time in every case. The jennet colts can run at liberty, with any kind of stock, but should have plenty of rations at least twice a day. The jack colts should be separated from all other stock except horse colts. Colts and fillies especially should be kept in the same enclosure with young jacks so that they

BLACK JACK

for sale; 26 months old; 13½ hands standard measure. **Nick Wagoner Menlo, Thomas County, Kas.**

---

will become infatuated with horse stock and forget that they belong to a different tribe, so that when the proper time comes a service can easily be had on a mare. The horse stock kept with young jacks should not be old enough to whip them, and the jack should be the master of the situation. The enclosure in which they are kept should be large and the larger the better, as all young stock require plenty of exercise, fresh air and sunshine. These things are not expensive, but an absolute necessity for their best development. Many of our best jack prospects are kept in such close confinement that they do not properly develop.

If our jack stock is to increase in size, as the demand is requiring, more attention must be paid to this particular kind of stock. This is also true of jennets. Too many jack breeders think that a jennet has little value, and she is kent accordingly. They must also increase her size.

All jennets which have not settled at a former service should be bred again; many of them will fertilize at this time of year after failing the entire season; their general condition is better; many of them do not shed their coats until the fall. Suitable quarters should be provided for these matrons where they can have a good windbreak but have their freedom. A bunch of timber is an excellent place for them to range. Plenty of good, fresh water must be had with a well balanced ration. Do not confine them exclusively to a straw stack, but let them have some grain. A good jennet properly handled is worth as much as the average pure bred mare and she should be treated according to her value.

It is not advisable to keep a large band of jennets together unless the enclosure is very large. The greatest difficulty in that plan is that in case of an abortion, others are liable to follow soon afterwards. It is not an uncommon thing for one jennet to abort, and several others lose their colts during the following week. This is the reason that large jack breeders usually keep only a few head of jennets together. This sympathetic abortion seems to apply more to jennets than to any other class of females.

A CAPSULE JACK COLT,
In the Herd of H. T. Hineman, Lane County, Kas.

Every jack breeder should have on hands a good supply of feed of a laxative nature; alfalfa is excellent, but it should be fed sparingly, as a rule. Carrots are an excellent feed; a few carrots a day have a good effect on all jack stock, and as a rule, are not very expensive, as they can be raised in almost any section of the country. One of the great requirements for all jack stock is an opportunity for more freedom.

Owners of jennets should pay more attention to the selection of sires. A good jennet can be shipped a great distance very profitably to be mated with an outstanding individual. In fact, it is a waste of time and money to use an inferior sire, regardless of price. The great demand is now and always will be for a bigger and better jack. In selecting a herd header he should have a considerable body and bone; this will afford plenty of room for heart and lung action and insures a better constitution and better producer in every way. The jack and mule market is demanding more bone. The size of the jack stock can be increased if the feeding capacity is developed. An animal without much constitution is not a good prospect, either from a breeding or selling standpoint.

WORK MARES AND MULES.

Dec. 28—C. W. Lamer & Co., Salina, Kas.

O. N. Steele of Ontario, Cal., has an ad in this issue. If you are thinking of going to California, read his ad and then write to him for information.

Some bargains in Southern land is advertised for sale by Sid L. Beason, Whitney, Ala. Read the ad.

If you are in the market for a saddle stallion, mare or a jack, write to the Kentucky Sales Stables of Fort Smith, Ark. They would be pleased to tell you about what they have for sale.

A bunch of jennets are advertised for sale or trade for a draft stallion by "Horseman," Water Valley, Tex. Read what he has to say about his jennets and write him for further particulars.

Ben Bohlander & Son of El Paso, Ill., start their ad in this issue. They have 45 head of imported and home-bred Percheron stallions and mares that they are pricing worth the money.

A bargain in the way of a 320 acre farm is advertised for sale in this issue by "215 Reed St.," Red Oak, Ia. This farm is in central Wisconsin, where crop failures are almost unknown. Don't fail to read the ad.

If you are in the market for a jack read the advertisement in this issue of Freeman Bros., Neligh, Neb. They have a good one they want to sell or trade for young mules.

John H. Chambers of Edinburg, Ind., is advertising some registered stallions for sale in this issue. See his ad.

If you need the services of a lawyer in collecting the money on your stallion notes, try E. R. Smith, Fairfield, Ia. His ad appears in this issue.

J. H. Fullilove, Jr., of Shreveport, La., has a splendid herd of high grade Jersey heifers from 8 to 30 months old that he wishes to dispose of at attractive prices. If you are in need of stock of this sort, don't fail to write him.

A bargain is advertised in this issue in the way of an Arabian stallion by H. Heckmann, Jerico Springs, Mo. Mr. Heckmann is quitting the business and is offering this fine stallion for $300. If interested, write him at once.

A good Percheron stallion is offered for sale or exchange by H H. Mills, Webb, Ia. His ad appears in this issue but if you are interested write him for full information.

If you are looking around for a registered draft stallion, write to W. L. Lake, Ft. Cobb, Okla. He also has a good jack that he will sell cheap. Read his ad.

R. M. Johnson of Bolivar, Mo., is offering for sale a splendid bunch of black jacks. Mr. Johnson states that he is getting too old to handle them; that he has been in the jack business for over forty years and has handled a great many jacks, and the man that buys jack from him gets the advantage of his forty years of experience.

N. M. Baldwin of Ottumwa, Ia., is advertising his imported stallion, Humboldt 80761, for sale cheap. Read his ad in this issue and don't fail to write him.

If you have a mare or some fillies that you would like to exchange for a Percheron stallion, read the advertisement of August Radloff of Libertyville, Ill., and write him for further information.

If you have a herd jack or a grey Percheron stallion that you would like to exchange for a black Percheron stallion, it surely would pay you to investigate what Elwood Rush of Lockwood, Mo., has to trade. See his ad.

Burress Bros., the well known breeders of Percheron and Belgian horses of Carroll, Neb., start their ad in this issue. They have lots of prize winners among their stock and if you are in the market for stock of this kind, it would surely pay you to investigate what they have.

If you have a little more land than you need, and would like to exchange it for stallions, read the advertisement of Eli Smith of Cushing, Okla., which appears in this issue. He undoubtedly could interest you.

A BIG CASH BARGAIN

In First Class Breeding Stock.

Two registered black jacks, 4 and 5 years old; heavy boned and right every way. Cash price for the two, $1,400.

One imported Percheron stallion; black; 8 years; 1,800 pounds; a high class horse. Cash price, $900.

I will take $2,100 cash for the three.

I am going out of the breeding business or would ask 50 per cent more. I guarantee this stock, and have the colts and the books to show for a business that has paid me over 50 per cent income on the price I am asking.

For particulars, address,
"S," Care American Breeder, 225 West 12th St., Kansas City, Mo.

Ten jacks and jennets are advertised for sale in this issue by Harry C. Parmenter of Yutan, Neb., among them being his famous show jack, Pulido. Read the ad.

L. W. Hoyt of Barry, Ill., has a nice bunch of weanling mules, also a few choice jacks and jennets, that he is pricing worth the money. Don't miss reading his ad if you are interested.

A good Percheron stallion is advertised for sale in this issue by H. A. Alcorn of Adair, Ia. Write him for particulars.

C. N. Palmer of Medford, Okla., has sixteen acres of land with a ten-room house that he would like to sell or lease. See what his ad says and then write him.

J. E. Bradley of Elmwood Stock Farm has sold Denmark Knight 3947, to be shipped to Mr. Marion Freeman of Colfax, Wash. This was a beautiful 3-year-old colt sired by Black Knight 2366, by Highland Denmark 730, by Black Squirrel 58, by Black Eagle 74, by King William 67, by Washington Denmark 64, by Gaines Denmark 61. Dam Dollie B 2333, by Artist Montrose 51, by Artist 75, by King William 67. Second dam Bonnie 1519, by Potts Artist 473, by Artist 75. This is a brother to the colt Mr. Bradley shipped a year ago to Buffalo.

Spohn's Distemper Cure is certainly a fine remedy for cholera among all kinds of fowls. With dry ground feed mix the cure, not giving any other feed, compelling the fowls to eat it. Use it as a preventive all through the spring and summer months. For gapes put a few drops of the cure into the mouth and throat of each young fowl for several days.

C. E. Thompson of Elberfeld, Ind., is advertising Bourbon red turkeys for sale in this issue at very reasonable prices. Read his ad for prices.

Read the advertisement in this issue of C. E. Thompson of Elberfeld, Ind., telling about the pure bred Chester white hogs he has for sale. They are priced right.

Any one wanting an Irish Setter puppy would do well to correspond with C. E. Thompson of Elberfeld, Ind. He is pricing six months old puppies at $5 each.

If you have any corn or oats to sell write to W. S. Browning of Lewisburg, Ky. He wants to buy from the producer.

D. Augstin of Carlock, Ill., starts his advertisement in this issue. He is one of the most reliable breeders of home bred Percherons in America. Don't fail to write him if you are in the market for either a stallion or mare.

Beecher Rayl of Kempton, Ind., is offering for sale his registered Percheron stallion as he cannot use him in his herd any longer. He is pricing him at a bargain—$500. See his ad.

ABSORBINE does not blister or remove the hair and horse can be used. $2 a bottle at druggists or delivered. W. F. Young, P. D. F., 388 Temple street, Springfield, Mass.

A good Belgian stallion is offered for sale by Fred Eggimann, Annawan, Ill. It would pay you to investigate this if you are in the market.

Read the advertisement in this issue of H. M. Stephens, Munden, Kas. He is advertising some good bargains.

If you are looking for an imported Belgian stallion, don't miss reading the ad in this issue of Sauer Bros., Sanborn, N. D. They have a good one for sale, or will trade.

Do you want to trade a good Percheron or Shire stallion for a 160-acre farm in Western Kansas, worth $3,000? If so, read the advertisement in this issue of James Hildreth, Dighton, Kas. This is surely a rare bargain.

A registered French Coach stallion is offered for sale in this issue by Ernst Klein of Lake Park, Minn. If you are interested don't fail to write him.

J. C. Huckstep, proprietor of the Fairview Jack and Jennet Farm at Eolia, Mo., starts his ad in this issue. Mr. Huckstep guarantees everything as represented and makes the prices right. If you are in the market for stock of this kind it will undoubtedly pay you to get in touch with him.

Taylor & Jones of Williamsville, Ill., write as follows: "Our third importation for this season of draft stallions and mares has arrived and we have never received an importation that came through in better condition. Not one has missed a meal and all are feeling extra good. Some of them have already been sold and all those in the market for anything in this line will be pleased with the lot we have to show them and the prices are such one can afford to buy. Come and inspect them and get our prices before buying either a team of good, serviceable draft mares or a draft stallion of any of the breeds."

Bell Bros., Wooster, Ohio, write: "Our horses exhibited at the International have arrived home in healthy condition and we are pleased to inform those interested that our entire stock of Percherons and Belgians is in fine condition at present. Inquiries in reference to our horses are numerous and we are having visitors almost daily. The large number of horses we have on hand at present makes a splendid selection. The Percherons, consisting of two, three and four year olds, represent the best animals we can purchase abroad, while the Belgians are the superior kind, horses with the type and quality that makes them easy to sell. Among the sales made during the past week we are pleased to announce the sale of the widely known two-year-old Percheron stallion "Korps," winner at the Paris Show this year, also champion at three state fairs and third at the International. Mr. O. Howard of Milford Center, Ohio, gets this horse, and with the great number of registered mares already guaranteed the horse, we are confident he will establish himself as one of the great sires. No other Percheron two-year-old has had such a record of show ring honors as has been given "Korps" this season."

A very fine collection of saddle stallions of the famous Rex McDonald breeding are advertised regularly in these columns by H. A. Greenwell, of Lakenan, Mo. If you are interested, write him.

If you have any property to sell, list it with the Real Estate Salesman Co., Lincoln, Neb. They will treat you right.

A good farm of 158 acres, 50 miles from Kansas City, is advertised for sale or trade for registered horses. Read the ad, "Box 16," Paola, Kas.

Anyone in the market for Chester White hogs should not fail to read the advertisement of B. M. Boyer & Sons, Farmington, Ia., and then write them for a catalogue.

If you are going to have a sale of any kind of live stock, why not let Colonel Oscar H. Boatman cry it for you. He is a successful auctioneer and would be glad to hear from anyone having sales to make.

Colonel R. L. Harriman of Bunceton, Mo., has a few open dates and would be pleased to hear from anyone holding a sale of live stock this winter or spring.

W. H. Fulcomer, Belleville, Kas., has a nice bunch of Shetland ponies for sale. His ad appears regularly in these columns.

See Isaac C. Lohman's ad in this issue and no doubt you can make a trade with him. He has some splendid stock for sale or trade. Mr. Lohman lives at Turney, Mo.

Richard Sellman of Rochelle, Tex., is advertising registered Morgan horses regularly in these columns. Anyone in the market for a Morgan horse should write Mr. Sellman for particulars.

If you are in the market for Scotch or Scotch topped Shorthorns, write to John R. Tomson, Dover, Kas. He has some splendid ones by the famous Gallant Knight's Heir.

Anyone wanting either Shorthorn cattle or Poland China hogs should write to C. H. White, Burlington, Kas. He has splendid stock and invites your inspection.

C. S. Nevius of Chiles, Kas., has some splendid Shorthorn cattle and Poland China hogs for sale that he will price worth the money. His ad appears regularly in this paper.

D. B. Gunn of Red Oak, Ia., will send his two-horse Guilder Road Builder to anyone of our readers on a fifteen days' free trial. Try it.

Don't fail to read the advertisement of the KKK Medicine Co., Keokuk, Ia. They might have just the sort of a position you are looking for.

Mrs. H. A. Brookhart of Arbela, Mo., is advertising S. C. B. Leghorns for sale regularly in our columns. Look up her ad.

Anyone wanting a good Belgian or Percheron stallion or mare should read the advertisement of the Blue Valley Stock Farm of Blue Mound, Kas., and then write them for further particulars.

If you have some jennets that you would like to exchange for a draft horse, or are in the market for a good jack, read the ad in this issue of R. J. McNee, Idana, Kas.

If you are looking for a bargain in the way of jacks or jennets, Geo. T. Poage of Garrison, Mo., can surely please you. Read his ad.

Read the advertisement in this issue of G. M. Scott of Rea, Mo. Mr. Scott says he had the best lot of jacks that were ever on his farm.

Registered draft stallions and mares, mostly Percherons, are advertised regularly in these columns by E. P. Hamilton & Sons of Garden Grove, Ia. Write them if in the market.

Ives & Bellman of Dellavan, Wis., have some splendid Percherons, Belgians and Coach stallions and mares for sale. This is one of the good places to buy stock of this kind. Try them.

Singmaster & Sons, Keota, Ia., have Percheron stallions and mares all ages and prices for sale. See their ad.

Two good Percheron stallions are offered for sale at a very reasonable price by Henry Dreher, Cedar Rapids, Neb. Write him for particulars.

John W. Waddill of Brashear, Mo., one of the most reliable breeders of Percherons, Belgians, Shires and German Coach stallions and mares, would be pleased to hear from anyone in the market for stock of this kind.

Read what W. S. Corsa, the well known breeder of Percherons, Shorthorns and Berkshires, of White Hall, Ill., has to say of Processed Crude Oil, advertised in our columns: "White Hall, Green county, Ill., Sept. 29, 1906. Mr. C. A. Stannard, Emporia, Kas. Dear Mr. Stannard: I wish you would ship at your earliest convenience another barrel of your Processed Crude Oil. You will probably discover from my several orders this product is meeting with great favor at Gregory farm. We are using it freely with great satisfaction and success. It is not only reasonable in price but very effective and not the least of its virtues is the absence of all bad effects on the hogs after it has been used on them, which cannot be said for all of the dips on the market. Wishing you the great success which you desire for this product, I am, sincerely yours,—W. S. Corsa."

The Morgan Horse Club

The Morgan Horse Club, whose purpose it is to promote the best interest of all Morgan horses, will gladly furnish any information which it can about Morgan horses. It offers its services to those who want to breed, buy, or sell Morgan horses. At the Vermont State Fair, it holds a Futurity Stake for Morgan foals each year. It distributes free blank forms of applications for membership in the Club, a Catechism on the Morgan horse, the Annual Club catalog (issue in January) and various other literature. For further information apply to **C. C. Stillman, Secretary, 165 Broadway, New York City.**

Parties interested in Morgan horse should be sure to read the communication from the Morgan Horse Club, 16 Broadway, New York City, printed in this issue.

Probably no stove manufacturer in the world has done more to raise the standard of cooking ranges and heating stoves, and to improve the character of stoves sold in American farm homes, than has the Kalamazoo Stove Co., Kalamazoo, Mich. We hope every one of our readers interested in the stove question will make answer to the Kalamazoo Stove Company's ad in this issue, and mention the American Breeder.

We have never seen a farm gate patent or otherwise, built or advertised that we consider the equal of the American Farm Gate which is regularly advertised in the columns of the American Breeder. Aside from the particular features of construction and convenience, upon which the patents of this gate are founded, it is made of absolutely the best material ever put into farm gates. This is well indicat

The Percheron Importing Company of South St. Joseph, Mo., is one of the good places of the country to buy Percherons, Shires and Belgians. Read their ad and see the prizes they won this year with their stock at the American Royal. They guarantee all stock.

According to the testimony of users the American Farm Gate Co. of Kansas City, Mo., has so satisfactorily solved the problem of manufacturing lasting, manageable farm gates that the company is winning a happy home with the farmers of the United States. Their gate—the American Self Lifting Galvanized Steel Gate—is not only self-lifting and easily managed by women and children, but is Gibraltar like in strength and lasting qualities. It is made of two-inch high carbon drawn steel tubing coupled together with the same material instead of the ordinary, breakable cast couplings used in other gates. It is horse high, being five feet where most other gates are only four and one-half feet high and has the advantage of being adjustable, and is equipped with an automatic equalizer which allows it to swing clear over uneven ground or snow. The makers also point out that it has both ratchet and loop lock and is consequently hog tight and bull strong. It is furnished with or without barb wires and is especially adapted for the use of the breeder.

It is said that there are more named farms in Missouri than in any other state in the union. This is probably due to the fact that Missouri was the first state to have a farm name registration law, the passage of which was secured by W. L. Nelson, present assistant secretary of the Missouri State Board of Agriculture. The cost of registering a farm name is but one dollar, payment to be made to the county clerk. Every farm should have a name. It promotes pride in the home place, and is an incentive to better farming.

BE AN AUCTIONEER · GET MY FREE BOOK IT TELLS HOW

Yes Sir!! That's what hundreds of graduates from this School do every season, and I have their own written statements to prove it. You know from personal experience that competent, wide-awake auctioneers are in demand. That their services are contracted for months in advance. That the work is not only pleasant and agreeable—but without exception one of the highest paid professions possible to engage in. You either know personally or by reputation Col. H. S. Duncan, Col. G. A. Hendrickson, Col. R. L. Harriman, Col. A. W. Cies and Col. E. Walters, all of whom are instructors in the **Missouri Auction School.** The average yearly income of these world-famed auctioneers would startle you. Why, it is not unusual for these men to make as much as $200 in a single day. Think of it! $200 for a few hours' work and work they enjoy. **YOU** can prepare yourself to be as successful as these men, and in only four weeks' time. There is a constant demand for competent auctioneers right in your own neighborhood. You need not go outside of your own community to find a sufficient number of engagements to keep you busy. **Supply this demand and your success is assured. Remember, ONLY FOUR WEEKS** of your time is necessary to enable you to become a successful auctioneer. Read what a few of our graduates say about me and my school. Then write me today for my big **Free** 96 page illustrated catalogue.

TO YOU FATHERS.—Investigate my school and my methods. Auctioneering is one profession that will not only fit your sons for an independent money-making profession, but one which they can engage in right in their own community and still live at home.

Col. G. A. Hendrickson

Col. R. L. Harriman

Col. H. S. Duncan

Col E. Walters

Col. A. W. Cies

READ WHAT THESE GRADUATES SAY:

$27,840 IN ONE BID.

COL. W. B. CARPENTER:
Dear Sir: I have made five sales this week and have a sale of twenty horses and two stallions. These horses are two of the best horses in this country and weigh 2,000 pounds apiece. Am dated now for every day in February and four over in March. Must tell you of a land sale I made. I sold 240 acres of land to the highest bidder. The land is six miles from our town and sold for $116 per acre or $27,840, which was $16 an acre more than was expected. Respectfully.
Madison, Nebr. O. V. SCHEER.

A SCHOOL OF REAL EXPERIENCE.

COL W. B CARPENTER:
Dear Sir: Being a graduate of the Missouri Auction School, the August term, 1910, I feel it my duty as well as a pleasure to tell my experience with the instructors of this school. I found them all to be gentlemen and professionals in this line. I would advise anyone intending to become an auctioneer to take a course in the Missouri Auction school. There is where you will get the real practice in selling all kinds of property from a monkey wrench to pedigreed stock and real estate. Without the instructions received in all kinds of sales, besides the real practice of selling at all kinds of sales, I would never have made an auctioneer if I had lived to be as old as Noah. I consider the instructions received in pedigreed stock worth twice the tuition if I never cried a sale in my life. Wishing the instructors of the M. A. S. the best of success, I am a walking advertisement for this school. H. H. OPPEDAHL.
Lake Mills, Ia.

HIS TIME ALL TAKEN.

COL. W. B. CARPENTER:
Dear Sir: When I came home from the Missouri Auction school in January, 1908, and hung out my shingle in Madison for work, there were five auctioneers doing business in this town. Today there is only one besides myself. I don't write this to boost myself, but just to show you that a little training like you get at the M. A. S. won't hurt you at all, if you are thinking of taking up auctioneering. I have had very good success. Have made a number of real estate sales. Have one dated now of 240 acres for February 3rd, and several pure-bred sales for January and February. Am dated December 29, 31, January 10, 12, 17, 18, 19, 24, 25, 30 and 31. February 2, 3, 4, 6, 7, 8, 9, 10, 14, 15, 16, 17, 18, 20, 21, 22, 23, 24, 28. So you can see that I am busy the larger part of the time. I hold the record of selling the highest-priced horses in the county this fall. Respectfully, OTTO SCHEER.
Madison, Nebr.

$30.00 IN ONE HOUR AND THIRTY MINUTES.

COL. W. B. CARPENTER:
Dear Sir: I want to thank you and the rest of the instructors for my success in the auction business. Without the help of the Missouri Auction school I would not have made good. I cried a sale for W. C. Franklin in November. I made the sale in one hour and thirty minutes and received thirty dollars for my work. I have made seventeen sales up to date. I have one competitor, and for some reason I have made every sale that has been made in this part of the country.
Blanchard, Okla. W. W. YODER.

SAYS M. A. S. MADE HIM.

COL. W. B. CARPENTER:
Dear Sir: I was a student and a graduate of the January class of the Missouri Auction School, 1910. I have just finished a very good season with 15 sales to my credit. I consider this good for a beginner. I will say to those who want to become auctioneers that time and money spent at M. A. S. is well spent, under the direction of Col. Carpenter, Col. Cies, Col. Duncan and Rev. Hendrickson. The gentlemen just mentioned in the foregoing, with other men, make the institution second to none. The advantage of the privilege to have actual practice in sale work makes an important point to consider when contemplating qualifying yourself for an auction salesman. But here I want to say that if I had not attended the M. A. S. I would never have been an auctioneer. I considered the matter of another school of auctioneering and also the M. A. S., but I decided the M. A. S. was the school for me. Wishing the school the credit that it deserves, I am Respectfully,
Pemberton, Ohio. F. W. CLARKE.

FIRST SALE $4321.25.

COL. W. B. CARPENTER:
Dear Sir: As I was thinking of you and the Missouri Auction school in general I will drop you a few lines to let you know I am still on earth. I think I did very well for a new man. I have had 15 farm sales since I came home and all seem to be very well pleased. My first sale was a dandy—all good stuff and sold fine. It amounted to $4321.25. JOHN R. TRIGGS.
Valley Falls, Kans.

These World Famed Auctioneers Give You Personal Instruction—

COL. G. A. HENDRICKSON,
Voice Culture.
COL. R. L. HARRIMAN,
How to Get the Money.
COL. H. S. DUNCAN,
Pedigreed Stock.
COL. E. WALTERS,
General Judging.
COL. A. W. CIES,
Horse and General Sales.
COL. W. B. CARPENTER,
Real Estate and Merchandise Sales.

These men, experts in their respective lines, each a well known, successful auctioneer, give our students personal instruction in the class room, and actual selling experience in the ring. The mere fact that they leave their own work to work in Missouri Auction School is a high compliment to the thoroughness of our course.

Next Term Commences Jan. 6, 1913

Arrange now to enroll in the January, 1913, class. This term is held just at a time most convenient for you—just between seasons. By enrolling in this term you not only get advantage of my **special proposition,** but you can get in your course at the school, receive your diploma, and get back home before spring work opens up. Remember—The Missouri Auction School is not an experiment. It has been in successful operation for the past seven years and during that time has turned out hundreds of successful auctioneers—many of whom are now making more clear money every year than the average country doctor, lawyer or merchant, yet they have nothing invested but their time. I would like to hear from you personally, and just as soon as I can, as I am now making arrangements for the coming term and as I personally see to the convenience and comfort of my students while in school it is of great assistance to me to know in advance approximately how many students I am to expect. As a special inducement for you to write immediately I will also send you, in addition to my big FREE 96 page illustrated catalogue, any one of these six books on Auctioneering by well known writers: "Burn Your Smoke," "20th Century Auctioneer and His Methods," "Opening Speeches for Public Sales," "What an Auctioneer Should Know," "He Who Sells" and "How to Get Business." Just write me a postal for the Big Free Catalogue and say which one of the six books you want. I will send both free and prepaid. The January, 1913 Term opens January 6. Four weeks of your time will make you a successful, competent auctioneer.

Encouraging Better Sires

The above photograph represents a 6-year-old draft gelding that sold for $220, out of a small mongrel mare and sired by a good pure bred draft stallion. The service fee of this horse has never been paid. The owner of the dam left the country and disposed of the mare. Would this encourage the purchase and standing of high class sires? Every one interested in better horses should see or telephone his member of the legislature on this point and have others do likewise. Get busy now within the next few days.

TRUMANS'
CHAMPION STUD

The world's greatest collection of Shire Stallions and Mares, Percherons and Belgians to suit the most critical buyers; Hackneys of Richest Breeding and Strongest Individuality.

Fifth 1912 Importation of Shire and Percheron and Belgian Stallions arrived Oct. 29. Thirty-four years in the business and not one dissatisfied customer.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us.

Address for illustrated catalogue and other information, mentioning the American Breeder.

Trumans' Pioneer Stud Farm
Bushnell, Illinois

The Reasons Why
You Should Purchase Your Stallions of Us

1st. Because we can save you money.
2nd. Because our Stallions are young and fresh and in best of condition for coming season.
3rd. Because we guarantee our Stallions to be satisfactory to purchaser.
4th. Because we carry half risk on horse's life against death.
5th. Because they have not been overfed for show purposes.
6th. Because you have a large number from which to make your selection.
7th. Because you will always receive courteous treatment.
8th. Because we have hundreds of satisfied customers.
9th. Because you do not have to pay a lot of extras which have been expended at the different stock shows.
10th. Because there will be no commissions to pay to a middle man should you make a purchase.

STALLIONS and MARES

Percherons and Belgians

In addition to the large number of Prize Winners at the French and Belgian shows this spring in Europe and at the various state fairs in this country this fall, we have a very large lot of good young stallions and mares of extra quality and bone, that we will price very reasonable.
We can show you 150 head of horses of the different breeds, the best lot ever imported to America. Sold with a reliable guarantee.

J. CROUCH & SON, Props. LAFAYETTE, IND.

Percherons and Belgians

Personally selected by me early in the season and
Imported From Best Studs of Europe
Young, Sound, Reliably Bred Stallions
good in size, bone, action and color. Every horse guaranteed and sold in condition for service. I work some of them in the harness every day. Among the Belgians is a magnificent seal brown grandson of the Brussels champion, Indigene de Fosteau.
Prices reasonable. Barn 4 blocks from Santa Fe depot.
W. H. RICHARDS, D. V. S., Emporia, Kas.

PARAMOUNT STOCK FARM
Imported and Home-Bred
PERCHERONS, BELGIANS AND SHIRES

My new importation of stallions and mares, which I personally selected, arrived last month. This importation, numbering over 40 head, comprises the best lot I ever imported, and with those already in my barns and pastures, makes Paramount Stock Farm one of the best places in America to come for strictly high class stallions and mares. Among them are prize winners and tops that cost a lot of money. Come to the farm, 2 miles north of Hudson, 9 miles southwest of Waterloo, and see them. Address, mentioning the American Breeder,
WM. CROWNOVER, Hudson, Blackhawk County, Ia.

TAYLOR & JONES
Williamsville, Sangamon Co., Ill.

Our new horses are now in the barns, and we have an extra good lot of Belgians, Percherons and Shires. We invite buyers to call and look them over. We buy the best we can buy, and if there were any better to be found we would handle them. Our guarantee is safe, and we can protect a buyer from loss for the full purchase price. Come and see us. It won't take long or cost much and we feel sure we can save you some money.

Change In Range Conditions

Tendency in Cattle Business to Offset Increased Cost of Production by Making the Product Better and Finishing it Before Marketing. Example of the Freight Charges.

Written for the American Breeder,
By Prof. A. D. Faville, Wyoming Agricultural College.

THE term "An Age of Progress" has become almost a byword with the American people, and yet few of us realize just what rapid strides we are making in almost every human activity. Each generation is called upon to solve new problems and meet new conditions, often necessitating radical readjustments.

The western stockman is fast realizing that he, too, must plan differently and adapt himself to a new set of rules. Naturally he often rebels and we hear him mourning the departure of the "good old days" when every man had a chance, the range was free, and the grass unlimited. Was this the golden age, and did the methods followed make for the greatest good? These are questions we may well ask ourselves, and in attempting to answer them, let us not lose sight of the fact that the greatest good to the greatest number should represent the goal of our ambition.

Not many years ago before the opening up of vast irrigation projects and the arrival of the dry-farmer, there was little to restrict the stockman's herds. His competitors were few, feed was plentiful, fences and cultivated areas were far from common. Gradually the smaller interests were absorbed by their more successful neighbors and cattle kings with vast holdings appeared. But they were not left to enjoy their gains in quiet. Hardy frontiersmen harrassed them on all sides and many are the tales of bloody warfare handed down to us.

With the settling up of the western country law and order gradually took the place of lynch law. The land baron made peace with his less fortunate neighbor; the cattle and sheep men began to tolerate one another's company and all looked with more or less disfavor upon the encroachments of the homesteader, farmer or "cherry picker," as he was contemptuously called. But the homesteader had come to stay. Cheap land was no longer available in the eastern states, while the west held out to him many golden promises. He endured every hardship, bravely faced danger and generally won for himself a home.

The opening up of vast irrigation projects both public and private took from the stockman much of his best winter grazing ground, while the arrival of the dry farmer only added to his troubles. His range was cut down, and fencing deprived him of many of his best watering places, so that he was often compelled to materially decrease the size of his herds. Many saw in this movement dark days for the stockmen and many were the prophecies of serious curtailment of the nation's meat supply. It is true, large sized holdings were broken up, big firms began making smaller shipments and tendencies appeared to be toward decreased production. Shipments may have fallen off during the transition period, but it was only for a time. Land put under cultivation yielded far more than of yore. Small flocks and herds began to appear as part of the regular equipment of the homesteader and in addition, much valuable grain was put on the market. Small holdings became the rule rather than the exception, and the total value of food products furnished by the west rose enormously.

This cutting down of herds and increase in land values served to add to the cost of meat production. Close figuring was often necessary to show a profit, and even expert juggling failed sometiems to reveal a balance on the right side. What was to be done to meet the new situation? Free range was not to be had, cheap labor was the exception and market prices on beef and mutton were not all that could be wished.

Herd improvement and better methods in handling and caring for stock served as a check to the downward trend of profits. Today we find a higher grade of stock on the range than ever before. Never was the demand for pure bred sires greater and never has more attention been paid to the grading of range herds. Breeders have found that the high grade animals mature earlier, fatten more rapidly and dress out a higher percentage of valuable cuts, besides possessing plenty of vigor and hardiness. Breeders of pure bred stock are found scattered throughout the range country and they are developing animals that can compete successfully with the best of the east. The western herdsman and flockmaster has come to be a power to be reckoned with in all our show rings. The west has demonstrated beyond the shadow of a doubt that it possesses all the requisites necessary to the production of the highest types of farm animals. An incident in connection with the Alaska-Yukon Exposition at Seattle bears on this point. The fall previous to the show, the Wyoming station purchased a ram lamb from a pen of two owned by one of the leading eastern sheep breeders. This breeder kept what he considered the better lamb to show the following year as a yearling. Both animals were almost identical in size. The Wyoming yearling met his former pen mate at Seattle. It was at least fifty pounds heavier and was made the grand champion American-bred ram of the breed. The same thing took place in the case of two ewes bought under similar conditions. It is facts such as these that give the West glimpses of its possibilities.

Formerly no provisions were made to carry range stock through severe storms, and thousands of animals perished for want of a few pounds of hay or grain. Today the prudent stockman plans for just such emergencies and winter finds him with feed placed where it will be easily accessible in times of need. Thus have ranchmen fought the increased cost of production and their efforts on the whole have been fraught with success.

For many years the range has supplied the bulk of stock for eastern feed lots. That it will continue to do so is an open question. The development of the agricultural resources of the Rocky Mountain region has opened up vast stock feeding possibilities and stockmen are not slow to take advantage of them.

Freight rates throughout much of the West are a serious handicap to the producer so it is to his advantage to ship as high priced and concentrated a product as possible. A fifteen-ton car of hay at $8.00 represents a value of $120. A load of feeder steers at 4 cents per pound have a value of $1,200. The same amount of fat beef at 7 cents is worth $2,100, while a 15 ton car of butter at 30 cents would be valued at $9,000. Supposing the freight on each car to be $100, we find the railroad company taking only a trifle over one per cent of the value of the car where butter is shipped. With fat beef, its share jumps to a little less than five per cent. On feeder steers, over 8 per cent is taken for transportation, while with hay, 83 per cent of the value of the shipment is turned over to the railroad company.

Facts such as the above indicate most clearly how a substantial profit may often be saved for the producer. Stock feeding means a long step toward the conservation of soil fertility, for it is estimated that from 85 to 90 per cent of the fertility value of crops is returned to the land where the crops are fed to stock and replaced in the form of manure.

Irrigated tracts throughout the range country are growing wonderful crops of alfalfa. Grains of the best quality are arised. In short, the country furnishes all the requisites for successful feeding.

This is fast becoming a recognized fact, and with it comes the desire on the part of the stock grower to reap the profits that formerly went to eastern feeders.

There are enormous areas that will always be given over to range purposes where cattle can be run cheaper by far than is possible on the high priced lands of the Mississippi valley. Supplement this range with the cultivated areas capable of furnishing cheap fattening feeds for the stockman and the western land owner is able to compete with any section of the United States in the production of beef and mutton.

Stallion Issue

The January 20 issue will be a stallion and jack number. We are going to offer the stallion and jack owners an opportunity to prepare special articles for that issue, allowing them to discuss any subject they care to. Any breeder who has had much experience can prepare a short article from 200 to 500 words. We prefer short articles. The breeders themselves may choose their subject and no one need to be afraid to send their material in. We will correct the grammar if requested, and make it read smooth.

These articles must reach this office on or before January 18. We should like to have them sent in as early as possible. Breeders are not very busy at the present time and there will be no excuse for anyone not writing something. Any subject that will be interesting to stallion and jack owners will be admissible. Breeders in one section of the country are interested in what others are doing in some other section. Capsule breeding; any breeding; barren mares; abnormal condition; holding colt shows; breeders' institutes; competition; service fees; changing localities; developing colts; market conditions; raising mules; jennet breeding; slow jacks; market types; there are hundreds of questions that breeders could write on if they will only do it. Now get busy, send in your material just as soon as possible

COLLECTING SERVICE FEES.

During a recent discussion among horsemen which the writer heard all agreed that it was necessary to enact a law giving a lien on the mare and colt for eighteen months after the first service. One of them was heard to say repeatedly that *they* should do something at once; another gentleman said *they* are you and I. If you and I do not get busy and perform our part of this service "they" will not do anything.

Within the next few weeks the legislatures will convene in many states, and this is a critical time. We want every breeder to talk to the lawmakers in his section; see them personally, or call them up over the phone; have every other breeder in the country do likewise in every state where a lien law is wanted. Use the telehpone, tell other breeders what we are trying to do; explain to your representatives and congressmen that you expect to stay in the horse-breeding business and get more proficient in the work; that you will furnish the best sires ob-

tainable if a lien is given on the mare and colt, and by so doing will help in adding thousands of dollars to the value of horses in your community. You need this encouragement, as the business must be profitable so that you can afford to buy the best sires. As long as a large percent of the service fee is lost you cannot afford to buy the best; that the country is being overrun with stallions and jacks of very little merit, because their cheapness makes it possible for them to take the chances; that mare owners themselves are demanding better sires, and the honest mare owners are willing to pay for it. Explain to them that the honest mare owners are in favor of such a law, and have a few mare owners talk to these lawmakers and in the conversation state that they are only mare owners.

These are the things that have weight and get results. Do not wait for somebody else to do it. Each and every one interested in horse-breeding has his part to perform, and if this campaign fails it will be due entirely to those who have not done their part of the work. Frequently we hear a breeder say that this difficulty does not interest him because he is able to collect all of the service fees. Every one of these successful breeders has more or less difficulty in making such collections, which at best costs him time and money and he frequently has to trade in order to make satisfactory collections. It would be easier for any one to collect the service fee with a lien on the mare and colt.

Many states have laws giving the seller of material a lien on buildings without filing any papers, and these laws have been found constitutional. An effort should be made to enact the Arkansas law in states not having a stallion inspection law, or where such a law is liable to fare badly. Where inspection laws are in use and working satisfactorily, the Utah clause might be introduced easier. The lien clause from the Utah law is as follows:

Sec. 11. Every person in the state of Utah complying with the provisions of this act, shall have a lien on the mare and a first lien upon the offspring of such service to the amount of the agreed service fee for the period of eighteen months after service, and it shall not be necessary in order to secure and fix said lien to secure, file or register any contract or statement thereof with any officer, nor shall it be necessary that the owner of such mare or foal execute any contract whatever; the said lien may be foreclosed in the same manner that a mortgage upon personal property is foreclosed.

And following is the text of the Arkansas law:

The owner of any male animal, kept for the propagation of his species, shall have a lien upon any female animal and her offspring to which such male is let for the sum contracted therefor, which lien shall attach at the time of service of such male and shall not be lost by reason of any sale, exchange or removal from the county, or other disposition without consent of the person holding the lien, the same may be immediately enforced. Provided; also upon the sale, exchange, removal or disposition of such female animal without consent of person holding the lien or with intent to defraud him, the owner of such female animal shall be guilty of a misdemeanor and upon conviction thereof shall be fined in any sum not less than twenty-five dollars ($25), nor more than fifty dollars ($50).

At any time within twenty months after his right of action accrues, the owner of such male animal may file with any justice of the peace in the county, a written statement, duly verified, setting forth amount of his claim, his cause of action, and a description of the animal upon which he has a lien, and the justice shall thereupon issue summons as in other cases and embody therein a description of the animal and an order to the constable to take the animal and her offspring, if there be an offspring, and hold to (her) or them subject to the order of the court.

If upon trial, judgment be rendered for the plaintiff, the court shall order a sale of the animal or animals as on execution sales to pay the judgment on the bond against the sureties for the amount of the plaintiff's debt and cost.

Dourine in the United States

A Disease That Spreads Very Slowly But Requires Closest Attention and Vigorous Means to Stop It. Past and Present Outbreaks.

Written for the American Breeder,
By James E. Downing, United States Department of Agriculture.

There is every reason to believe that dourine in horses has not been entirely eradicated in the United States and that it still exists in certain districts of the West. Breeders throughout the country have all along felt assured that this dread disease, which effects both stallions and mares, had been stamped out and while outbreaks accur at intervals, they have been traced to some recent importation.

But it now appears that the effects of the initial outbreak, back in Illinois in 1888, was never thoroughly uprooted and that the disease has been lurking in the western herds where it has been diagnosed as swamp fever.

Veterinarians of wide experience declare that a typical case of dourine is not difficult to diagnose, but unless it is a well-defined case it may be taken for one of several, of which swamp fever is one. It is therefore not surprising to learn that reputable veterinarians have diagnosed cases in Montana as being swamp fever, when further investigation showed the disease was probably dourine.

At one ranch a stallion and four mares were destroyed. Some years previous the animals in this same herd similarly infected had been diagnosed as having swamp fever. The stallion and mares infected with dourine were dispatched by a veterinarian of the U. S. Bureau of Animal Industry, who had been sent to inquire into the matter. This same veterinarian destroyed 20 horses infected with dourine, in Custer and Dawson counties this fall, and is of the opinion that he can locate that many more that he did not get to.

The indications are that the disease has been spreading for some time and what at once assumes an alarming phase of the situation is the fact that horses from this section of the state have been shipped to other states and no estimate can be formed of how far-reaching or what the limits of the disease may prove to be.

The state authorities of Montana realize the importance of taking prompt action in the matter and have quarantined an area in the two infested counties, 100 by 75 miles in extent. A state order has also been issued that all stallions must be kept off the open range within the quarantine lines and riders have been deputized to see that this order is obeyed.

According to a circular issued by the U. S. Bureau of Animal Industry, entitled "Dourine of Horses," the disease was first suspected in the United States, in 1885, and recognized in 1886. The first authentic case was found at Bloomington, Ill., where the infection was traced to a Percheron stallion, imported from France in 1882. This stallion had a brand mark under his mane very much resembling the letter D (dourine?). It is supposed he was affected with the disease and had been branded in France before being transported to this country. The nature of the disease not being at first recognized, its dissemination occurred before attention was attracted to it.

The state of Illinois took hold at once and eradicated the disease by 1888, but not before an affected stallion had been shipped to Gordon, Neb., and it is the belief of those acquainted with the present situation that the dourine in the western ranges today can be traced back to the Gordon stallion. The outbreak of 1892 and 1901, although somewhat widely separated, are supposed to all trace to this stallion.

The outbreak of 1903 in Van Buren county, Ia., where two exposed stallions were castrated and 18 mares slaughtered, is thought to have originated with an imported Percheron stallion purchased by a company of farmers.

The last outbreak was located in Taylor county, Iowa, in June, 1911. The diseased and exposed animals were placed in quarantine at once. The exact origin of this outbreak was not definitely located, but all cases lead back to a Percheron stallion, which was imported in 1909 and brought to Lenox, Ia.

It was at the time of this last outbreak that Dr. John R. Mohler, chief of the division of pathology of the U. S. Bureau of Animal Industry, on July 28, after a careful and prolonged examination of almost 200 slides, discovered in the blood-tinged serum, obtained from a recent developed plaque on the abdomen of one of the affected mares, 6 living, wriggling trypanosomes. This confirmed the diagnosis and also established the identity of the disease with that of Asia, Africa and Continental Europe. This was the first discovery of tyrpanosome equiperdum in the natural cases of dourine in the United States and was the reward of 12 years of search by Dr. Mohler.

That every precaution has been exercised to keep the disease eradicated, especially in the West where the outbreaks have occurred, is evidenced from the following taken from Bulletin 142 of the U. S. Bureau of Animal Industry:

"Investigations have been made in various parts of North and South Dakota, Nebraska, the Indian reservations, Washington, Oregon, Wyoming, Oklahoma, Utah and Montana. A careful inspection has been made of the range horses in some of the principal range states, several thousand animals having been inspected in such states in the roundup work, with the assistance of veterinary inspectors engaged in other lines of field service, such inspections having been made for the detection of scabies, glanders and dourine.

"The general method has been to have the horses in any section of the country that has ever been regarded with suspicion, rounded up during the breeding season and examined. In the states of Montana and Wyoming the horses on the Indian reservations have likewise been examined, not because of diseases having been reported among the Indian's horses in these states, but because the fact that if there were any diseas in the country the conditions prevailing on the Indian reservations would be likely to furnish an ideal medium for its development and dissemination.

"For many years the Crows, Arapahoes, Sioux and Shoshones have journeyed back and forth in the fall of the year between the Sioux reservation at Pine Ridge and the Wind River reservation in southern Montana. It is their custom to leave some of their horses as gifts to their friends, and it was the possibility that some of these animals might have been affected with dourine that caused such careful inspections to be made at the neighboring reservations. Representative herds of range horses have likewise been examined, even when such herds have never been regarded as suspicious, and all herds that were ever regarded with suspicion were kept under surveillance for several years.

"In many instances the diseased animals were capable of doing some work and unless they breed there is no danger to other animals from them. It is this danger of being bred which makes it essential that they should be destroyed."

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

INJURED JACK—I have a very fine jack, worth $1,000; he served 66 mares the past season which closed about July 15th. On or about September 1st, after close of season, I went out to find him one morning; his head seemed to be drawn down and he seemed to have no use of his hind parts. I tried to move him around and when he made an effort to do so, he fell and it took six good men to help him up. I at once called the best veterinarian and two doctors. Some said it was his kidneys, others said rheumatism and some that he had received a physical injury. We gave him strychnine hypo, after he had gotten down again. This put him on his feet and has kept him up ever since, though he reels like a cat, and every two or three days it takes three to four men to get him up when down; possibly for the next three or four days he will get up without help. Several times since he got this way he would seem to be nearly well and all at once he would act as though he had lost entire use of his parts. Each time that he appeared to get worse his kidneys seemed to clog; urine thick and dark, eyes are as bright as ever, and he looks as well in every way as he ever did, appetite is good but cannot bray as he formerly did. This jack has been kept in a lot 30 by 120 feet, a 12 by 12 stall opening into lot. The night before he appeared in this condition some 12 or 15 mules were turned into a pasture next adjoining his lot. His fence lot was made out of 2 by 8 lumber, 5 feet, 4 inches high. He would run up and down the fence trying to get to the mules. One very large, 17½ hands high, mule would stand and play with him by the hour, but had done this a good deal the winter before. I was under the impression that he had possibly reared, trying to catch hold of this mule; in doing so he may have fallen and hurt his back. I have had this jack bathed, used hot applications, used alcohol and various liniments, and for the last two months he has taken from three to four grains of strychnine every day; he eats and drinks as heartily as he ever did, but does not get any better. I will state further that I have kept this jack since he has been in this condition, in a nice, warm stall, with a floor of clean oat straw under him. The local veterinarian quit him some time ago, but an old horse man told me that it was a clot on the spinal cord, which, when removed, he would be sound and well, and if he was sound and well I could get $1,000; being a poor man, I hate to lose this much, but have felt several times like killing him to be rid of the trouble. I should state further that he does not seem to be in any misery, except when his kidneys stop acting. Jack is eight years old; did not serve more than twice any day during the season; he is 15¾ hands high and I seldom pitted his mares. I have had many men to look at him and no one ever saw a similar case.—Texas Subscriber.

REPLY—We suspect that your jack was injured in the manner set forth in your letter, and it occurs to us that you have been following out quite sensible measures in treatment. The injury no doubt involves either the deep muscles of the back or perhaps the spinal cord itself. We believe your jack would have made more improvement had you not permitted him to lie down, for in his struggles in attempting to get up he very likely has made matters worse. Such cases usually do better to keep them standing by supporting in slings and take them out once daily and give moderate exercises by leading. At the best they often prove obstinate, yet inasmuch as considerable money is at stake you are justified in treating him a little further. Clip the hair closely over the small of the back for a space of ten inches in diameter

and apply the following, rubbing in well for several minutes with the hand: Powdered cantharides 1 ounce, biniodide of mercury 2 drams, vaseline 4 ounces. Mix these agents all together and apply as directed and allow to remain on for at least 24 hours. This application should blister the parts. After 24 hours wash off the blister with quite warm water and soap, and when dry apply a little cottonseed oil daily. If improvement is noted the vesicant may be repeated in about three weeks. It is well to continue the strychnine internally.

PARALYSIS OF THE BLADDER—My weanling stallion colt constantly wastes urine, dripping over and befouling his hind legs. He also has an enlargement about the size of a hen egg at the navel; a small hole in the abdominal wall allowing the intestines to protrude against the skin. Is this rupture in any way responsible for this inability to hold and naturally discharge his urine. There is no competent veterinarian within 100 miles. Please instruct me what to do. This is a royally bred and otherwise valuable colt. I am frequently obliged to do my own veterinary work myself. —New Mexico Subscriber.

REPLY—Your letter indicates that your colt is troubled with paralysis of the bladder, which is a very obstinate ailment. We would suggest that you give the animal from ten to fifteen drops of the fluid extract of nux vomica in a little water three times a day. This mixture may be thrown into the mouth by means of a small hard rubber syringe.

SETTING UP HORSE'S TAIL—Can you instruct me minutely in performing the operation of setting up a show horse's tail?—New Mexico Subscriber.

REPLY—It is hardly safe for one not well versed in the anatomy of the parts as well as the care required in the surgical technique to undertake an operation of this sort, as it may result in the ruin of a valuable animal. Such work requiring great skill should be delegated to one who has given it special study, in other words, a skilled veterinarian.

WIRE CUT—I have a yearling filly that got cut on wire about last June on front foot under fetlock. It healed up soon, then came sores about half way between knee and ankle. I got that place healed up and now there is blood boils come and break first at one place and then another. There is a large place on her leg about the size of a gallon bucket. Please tell me what to do for such a place.—Missouri Subscriber.

REPLY—Your letter would indicate that the wounded limb has become infected, resulting in the abcesses mentioned. Give the filly 30 grains of calcium sulphide on the tongue three times a day. A once-a-week injection with bacterian would aid in overcoming the difficulty. The abscesses should be opened as fast as they form.

FEEDING CANE SEED—I have heard that natural cane seed will cause a mare to abort. What do you say about it?—New Mexico Subscriber.

REPLY—Our attention has never been called to feeding cane seed as a substitute for other grain, so could not advise you as to its effect on the generative organs. Any food that would cause derangement of the digestive organs would be dangerous in this respect, and we suspect cane seed would not be easily digested, therefore should be fed with caution.

SCRATCHES—I have a horse that has had scratches all summer. I have tried calomel and he would appear to be all right, but when ridden they would break open again. I have used several bottles of Balsam of Myrrh and it heals the sores in a short time, but when I stop using it they break open again, generally in a different place. He is in good condition and seems to feel fine and is kept in a large, well ventilated, clean shed. Would be glad if you could advise a remedy. If ridden hard he seems to get fever above the hoof to the pastern.—South Dakota Subscriber.

REPLY—In order to promote a cure of an obstinate case of scratches one must abstain from doing those things that aggravate the disease. The skin at the affected part is dry, hard and unyielding and inclined to become more inflammed and aggravated by much use of the animal. Water should be left off the parts as much as pos-

Government Horse Breeding

Reports on Work Being Done in Colorado, Iowa, Vermont and Virginia, With Carriage Horses, Gray Draft Stock, Morgans and Army Horses.

Government work in horse breeding, including demonstrations and experiments with drafters, carriage horses, Morgans and army horse material, is discussed in a recent bulletin from the United States Department of Animal Husbandry. The carriage horse breeding work in co-operation with the Colorado Experiment Station, the author states, is progressing very nicely, the 1912 crop of foals being an unusually fine lot of youngsters. From the twenty-four mares bred at the station during the season of 1911, fourteen foals were dropped, eleven of which are alive and thrifty. Of the three foals lost one died at birth, one died at the age of 10 days from distemper and one was fatally injured in the pasture. The crop of foals is smaller than usual, but the average excellence is above that of previous years.

The ranks of the stud were badly depleted during the past year by a very serious epidemic of distemper, which seemed to attack the young animals in its most virulent form. The disease spread through the entire stud, in spite of everything that could be done to check it, and resulted in the loss of nine animals as follows: One 3-year-old stallion, two 2-year-old fillies, four yearling colts, one yearling filly and one foal.

The board of survey met on January 16, 1912, and condemned fourteen animals, three of which were the property of the Department of Agriculture and eleven the property of the experiment station. Of these eleven have been sold at public auction, two died of distemper, and one remains to be sold.

The following statement shows the animals in the stud on June 30, 1912:

	Stallions	Mares	Total
Aged	3	29	32
4-year-olds	1	3	4
3-year-olds	3	4	7
2-year-olds	6	4	10
Yearlings	8	5	13
Weanlings	1	10	11
Total	22	55	77

Draft Horse Work in Iowa.

The gray draft horse breeding work in co-operation with the Iowa Experiment Station is still in progress. Of the eight mares bred in 1911, four have produced living foals, all of which are doing well. Two of the foals are cross bred Shire-Clydesdale, one sired by Dapple Tom and out of Gray Pearl, the other, foaled July 5, 1912, sired by Marmion and out of Rosebush. The other two foals are cross bred Clydesdale-Shire, both sired by Kuroki, one being out of Wrydelands Starlight and the other out of Kirby Bedon Firefly.

At the present time the breeding stud consists of the following horses, all gray in color: Two Shire stallions, five Shire mares, one Clydesdale stallion and four Clydesdale mares.

Since the breeding work has been in operation 14 foals have been dropped and have lived to sufficient age to determine their color. The breeding and colors are as follows: Clydesdale-Shire crosses—7 grays, 3 bays; total, 10. Shire-Clydesdale crosses—3 grays, 1 probably gray (foaled July 12, 1912); total, 4.

Eleven of the progeny are living and are doing well. The breeding and color of these colts are as follows: Clydesdale-Shire crosses—4 grays, 3 bays; Shire-Clydesdale crosses—3 grays, 1 probably gray (foaled July 5, 1912).

Three of the Clydesdale mares have been bred to foal in 1913 and one filly was in foal when purchased. All of the Shire mares have been bred to Scot's Grey, the Clydesdale colt recently purchased to take the place of Kuroki, the original Clydesdale stallion.

During the fiscal year the stud at the Morgan Horse Farm, at Middlebury, Vt., was increased by the purchase of the following stock, secured at Meade, Kas.; One 8-year-old mare, by Julian Morgan (4448); one yearling stallion, by Headlight Morgan (4683); two 2-year-old fillies, by Headlight Morgan (4683).

The board of survey condemned four brood mares in 1911, which were sold at public auction on Nov. 21, 1911 At the same time four condemned weanlings were sold by the Vermont Experiment Station.

The following statement shows the number of horses on the Morgan Horse Farm on June 30, 1912:

	Stallions.	Mares.	Total.
Aged	*2	21	27
4-year-olds	1	1	2
3-year-olds	2	6	8
2-year-olds	4	6	11
Yearlings	2	3	6
Weanlings	8	7	15
Total	10	44	69

*One stallion leased to Massachusetts Agricultural College.

Note—Two colts have been gelded and four aged geldings are kept for work.

During the winter the use of silage as a feed for brood mares was tried out with very satisfactory results. The mares were left out during the entire winter, being brought in just before foaling time in the spring. An open shed afforded protection in stormy weather. Their daily ration consisted simply of 20 pounds of silage and 10 pounds of hay. The mares came through the winter in better condition than those of a check lot wintered under similar conditions but with a grain ration, and their foals when dropped were all straight and sound.

During the breeding season of 1912 the provisions of the army horse-breeding plan were made available to mare owners in Vermont to breed to stallions at the Morgan Horse Farm. Fairly good results have been obtained thus far, although the plan has not been given the publicity which it needs to acquaint farmers with it.

Of the 51 mares registered by the bureau in Virginia, in the experiment to test the plan of the government to encourage the breeding of horses for the United States army, 27 were bred to Henry of Navarre and 11 to Octagon; 13 were not bred. Of the 27 mares bred to Henry of Navarre 13 have foaled, 4 foals being colts and 9 fillies; 14 mares missed. Of the 11 mares bred to Octagon 4 are reported as having colt foals, 6 missed, and 1 died shortly after having been bred. As indicated in my last report, the main feature of this experiment is a success; farmers are willing to breed mares to remount stallions on the terms proposed by the government.

COMING AGRICULTURAL AND LIVE STOCK MEETINGS.

Kansas Board of Agriculture, Topeka, Kas., January 8, 9 and 10.

Nebraska Organized Agriculture (a dozen organizations), Lincoln, Neb., January 20 to 25, inclusive.

Indiana Draft Horse Breeders' Association, Claypool Hotel, Indianapolis, Ind., January 22.

Missouri Farmers' Week, Columbia, January 13 to 17, 1913.

Colorado Farmers' Congress, Fort Collins, January 13 to 17, 1913.

Central Shorthorn Breeders' Association, Kansas City, Mo., Live Stock Exchange, February 11 and 12.

SCIENTIFIC BREEDING SCHOOL.

The most important thing in the matter of instruction at any institution is the real success attained. One of the first things understood in this school is that no student shall be laughed at for any mistake. This probably has more to do with the great success of these students than any other one thing. Grey haired men are not afraid to confess their ignorance before this school, for they readily understand that it is a school of instruction and not one where "smart Alecks" are given any preference. It is made plain that the object of attending this school is to accumulate necessary information that may be converted into dollars. If a student makes a serious blunder nothing is heard from it. They are all strangers assembled from the four corners of the earth and their union is for their individual good. A great many breeders have not attended this school because they were afraid some one might laugh at them. We doubt if another school in the world having such a short number of days at a term can compare with this in the vast amount of information gained by its students. These men work from 7:30 in the morning until 10:30 at night for an entire week with wonderful interest. Not a single individual seems to tire at any time because he realizes that every lecture and demonstration will be of great value to him. Most of them who have had experience can associate the different instructions with some particular case they have had, which makes it interesting and easily remembered.

Another interesting feature is that every one of these students learns the anatomy of the male and female organ remarkably quick. Within a week's time they speak these big names; easily describe their functions and locate them on the charts. Mastering this is the foundation for all breeding instruction; without this information no breeder can expect to gain much real scientific knowledge. These names are repeated together so that each one can get the correct pronunciation; numerous charts are used in learning the names, location and functions of parts. At the end of a term nearly every breeder can trace either the male or the female egg from its origin to conception.

Getting the semen is an interesting study. A dead mare is hung up in a position similar to her natural position. The operator makes an opening on the right side of the mare so that one hand may be inserted under the uterus. By this method he can easily explain to the student where certain mistakes are being made; also give him the correct position.

Attending this school is not all labor of a kind to tax the individual, as there is much recreation given in different ways, which is greatly appreciated by the students. It would be impossible to tax a large number of individuals who were accustomed to active outdoor life, and subject them to real close confinement, so it is necessary that a certain amount of exercise and recreation be taken each day. This is provided for in a way that not much time is lost.

There always have been failures in every line of occupation. There are a few failures among those who have attended this school, but this is largely with those who have attended during its early life, while the school was not complete as at the present time. It is now very complete and any one interested in breeding can make a success if ambitious. The large per cent of breeders who have doubled their income without increasing their investment should be considered seriously by every horse breeder. This school is of more value to those who use natural service only, than it is to those who expect to use the capsule system. When natural service is employed every service must count. It

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED,
225 WEST TWELFTH STREET,
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Chicago Representative,
JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates.
1 inch: 1 month, $5.00; 1 time, $2.80.
½ inch: 1 month, $2.80; 1 time, $2.00.
Rates for longer time or larger space furnished on application.

Subscription price, per year, $1; three years, $2; clubs of four, per year, $3.00.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

Copyright, 1912, by the Graham Publishing Co.
All persons are warned not to reprint any part of this paper without giving full credit for the same to the American Breeder, Kansas City, Mo.

ASKING QUESTIONS.

It is with pleasure that we note the great interest breeders have taken in our "Question Department," but we doubt if the average breeder realizes how much real value this department is to the breeding public. The writer has delivered lengthy addresses on particular subjects, covering every phase of the subject under discussion and then at the end offer an opportunity to ask questions. The very identical things that had been explained in detail were asked for over again. This shows that the average individual wants his particular questions answered to the point. The average reader has not realized how many questions we have answered on important subjects. A service requiring a great amount of labor on our part.

But this is not all of it. Breeders that had no conception as to the real trouble have written us descriptions of conditions given in their own plain language, which made possible a diagnosis of those conditions, giving the breeder a working knowledge that he never had before. It explains to him the real foundation of his trouble and in many cases gives him the name of a disease or a condition.

The important part of this "Question Department" is that practically every question asked is of importance to all of our readers, because no one owning stock knows just how soon he may have a similar condition, and this information will teach him what to do immediately. We want all of our readers to feel free to ask questions on any subject pertaining to live stock. Frequently a reader states that he wishes to have just one more question answered, as though he was imposing on our good nature. We want it understood that any of our readers have a perfect right to ask these questions and continue to ask them, without feeling under any obligations. We feel proud of the confidence which the American breeders have placed in us by asking these questions. During the past year more questions have been answered on breeding subjects in the American Breeder than in the question departments of all the other papers we know. We are glad to have the distinction of being the leading authority on these subjects. These questions have come from practically all classes; some of the most scientific men in the country have sent us questions that have been answered with the same respect that any other breeder would receive.

It might also be interesting to our readers to know that many of the leading veterinarians, physicians and practically all of the agricultural college professors, read the American Breeder closely. It is not the great volume of material that these men are looking for, but it is the specially prepared information in a condensed form that they want. We have published a lot of information that never was printed before and we expect to continue this sort of service investigations, and ask the co-operation of everyone interested in better live stock and a higher civilization.

RENEWING SUBSCRIPTIONS.

In renewing subscriptions we have given those an opportunity to renew for three years so that it will not be necessary to renew so frequently. Sixty-six and two thirds cents a year is not beyond the reach of any one who owns live stock. A publication devoted to one's own problems certainly ought to be worth that much to any one interested. Any one article, or an answer to a question that could not be obtained elsewhere, should be worth this amount of money.

We are well pleased and appreciate the manner in which the readers of this publication have renewed their subscriptions promptly. The subscription price is $1.00 a year, or three years for $2.00 without any premiums. The paper stops at the time for which the subscription has been paid. We do not keep any subscription account; neither do we have any free list. Those who read the American Breeder pay for it in advance. It is our intention to continue to make the paper stronger which will necessarily require more expense.

The readers of the American Breeder have had much to do with its management. They have named it and suggested the number of issues per month. We doubt if there is a publication in existence where there is a closer union between the publisher and the readers. There are a few of our readers, however, who wait until their subscriptions expire, then send in their renewals with request that we be sure and send the back numbers so that they will not miss any issues. This we try to do, but very often the best issue they have missed has been exhausted by repeated calls and it is an inconvenience all around. We hope all those who can, will renew as promptly as possible. The date of expiration is on each wrapper so that any subscriber can tell just when his subscription expires and renew in plenty of time. It takes about three weeks to get the renewals on the books in good shape; at this season owing to the heavy rush of renewing subscriptions, it may take a little longer than that, but we keep the count up from day to day, so that every subscription in the office is provided for when each issue goes to press. Fully half the renewals are coming in for three years, and here is a sample of the letters coming with them:

To the American Breeder:—You will find enclosed a check for $2.00 for which extend my subscription to the American Breeder for three years. I want to say in regard to your paper that the more I read it, the more I think of it. I consider it the most valuable paper I take, and I couldn't think of doing without it. I consider each copy I get worth the year's subscription and some of the copies are worth many years' subscriptions to me. —A. J. McLarty, Ramsey County, No. Dak.

AMERICAN CARRIAGE HORSES.

An experiment in carriage horse breeding has been going on for several years. There is an abundance of material for these experiments. There are more standard bred horses than there are of any other record. They do not all breed true to any special type, yet we doubt if there is another class of horses in the world with more staying quality. The ancestors of every individual has had to meet certain requirements before they could be registered. We believe this is a good qualification and should be preserved.

The "American carriage horses" seem to have several different types. At one state fair a special type is given preference, while at some other show a different type is made the model. Some wish to convert this class into calvary horses. Others wish to encourage a wagon horse, weighing 1,200 pounds or more. Others place the premium on action. It seems to us that a lot of energy is being wasted. We would like to hear from our readers, giving their opinion on the American carriage horse, as to type, quality, blood lines to be incorporated, whether record association shall be established or not and other things pertaining to this class of live stock.

STALLION FENCE.

With the universal good success of stallion pastures containing from one to three acres, we believe that all breeders should study this condition and method of handling satllions and jacks. The breeding paddock should not be in this enclosure. The barn should be a small separate apartment away from other buildings so that the stallion can run in and out at his leisure. If other stock are adjoining this enclosure, a fence of some kind can be erected from ten to 20 feet from the stallion fence to prevent other live stock getting close to the stallion.

Now, what we want is for those who have had experience in building a stallion fence, to tell us about it; giving their methods and their reasons for using a particular kind of material, size, anything pertaining to a stallion fence. This will be greatly appreciated by thousands of stallion and jack owners. We would like to have this for the next issue.

MARE OWNER EDITIONS.

A very large number of stallion and jack owners have written us requesting that we issue another series of mare owner editions. This we have concluded to do. There will be two issues in February and two in March, making four issues containing valuable information for mare owners; nearly every subject of interest to mare owners will be discussed during these two months. A number of excellent photographs will be used to illustrate features on these subjects. No breeder can expect to have a good breeding district without educating his mare owners. In addition to the great value in producing more and better colts, it serves as one of the greatest advertisements ever introduced. Every time a mare owner gets a copy of this paper he will think of the owner of the stallion or jack who has paid his subscription. We notify every mare owner by mail that his subscription has been paid for four issues, giving the name of the individual who has paid his subscription, and request him to call and see the breeding stock.

Notices will be sent out before the papers are mailed so that the mare owners will be looking for these issues and read them closely. We have studied this situation until we know how to get the best results. We have heard from hnudreds of men who have used this method of educating their mare owners, and they state it was the best money they have ever invested.

The subscription price for these four mare owner editions, in clubs of ten or more, is ten cents per subscription—a club of ten will cost $1.00. Each mare owner will get four papers. We will make this paper an extra good one and start the subscription at a time when most mare owners are not very busy, so that they will have time to read carefully. This will bring them up to the breeding season in a better understanding of conditions.

The owner of every good stallion or jack can well afford to send the paper to at least ten of his best mare owner friends. In sending these names it is best to send in the leaders—the most progressive—as others frequently follow in their foot steps. The names for these mare owner editions should be sent in as soon as possible, as it requires an enormous amount of labor to get them ready to mail. Be very careful that the name and initials, and the correct address is given. A dollar or two spent in this direction—which is a very small sum in the way of advertising—is the best money any breeder can spend in his business.

These names must reach this office before February 1. A club of ten will cost $1.00; additnonal names will cost ten cents each. Each mare owner will receive four issues of the American Breeder.

TEMPERATURE OF LIVE STOCK.

Every breeder should have a veterinary clinical thermometer. This is used for taking the temperature of animals and is different from the one ordinarily used in keeping the temperature of water. The hot water thermometer has a sliding mercury which varies with the temperature while the clinical thermometer runs up to the temperature of the subject where it registers and remains at that point for a considerable length of time. It is usually necessary to shake it down before using again.

A clinical thermometer is used by physicians, veterinarians and horse breeders. In taking the temperature of an animal it is inserted into the rectum and held there about one minute. The temperature should register in normal condition about 100 degrees in the horse, if the animal has not been exerted or excited, and if the thermometer should show 102 degrees or more, it is evidence that there is a disturbance somewhere and the animal should receive medical aid. In such cases as influenza the temperature frequently reaches 103 to 104 degrees, and yet the animal might not show much signs of being sick, but if not relieved it is an indication of a serious condition in breeding stock.

The clinical thermometer is used to note the physical condition of mares. Mares rarely ever conceive when the temperature is above 102 degrees, provided the animal is not excited or has not been warmed up from exercise. There are exceptions to this case in warmer countries or seasons of the year.

The clinical thermometer used by horse breeders should be longer than those used by physicians; it should also have a bulb on the exterior end so that it may be held firmly in case of taking the temperature in the cervix. A few cases have been reported where the thermometer slipped out of the fingers and made it difficult to extract out of the uterus.

In taking the temperature of a human the customary method is to place the thermometer under the tongue so that it will be plain that the veterinary or any other thermometer should be thoroughly washed before being used in other cases. The average temperature of the human is about 98½ degrees when in normal health. The thermometer must be held in the right position to note the exact registering of the degree of temperature. A physician or a veterinarian can easily explain the working of this instrument.

THE HORSE BREEDING SCHOOL

NEXT TERM JANUARY 13 TO 18

Breeders with money invested in the business cannot spend a week's time and their tuition fee to better advantage. Fathers and mothers need not be afraid to send their boys. Ask any graduate.

Here are some more good letters. We have never had space to print all we get.

I have attended the Graham Scientific Breeding School at considerable traveling expense and feel that I have been greatly benefited by it. I consider any one of the many lectures we have had well worth all it has cost me.—R. J. McAdams, Lisbon, La.

I have attended the Graham Scientific Breeding School and find it much better than I expected. One lecture is worth the whole time and expense.—S. L. DeWitt, Blue Springs, Mo.

I have attended the last term of the Graham Scientific Breeding School, with great benefit.—A. M. Larson, Whiting, Ia.

I have attended the Scientific Breeding School and I can't say too much about the good work I have accomplished. I would like for every horse man to come to the term of school in January.—J. J. Buchta, Russellville, Mo.

I have attended the Graham Scientific Breeding School and I think the lecture delivered on diseases of the mare, and remedies, was worth the price charged for the whole term, and for the morality I can't say too much in behalf of the school.—W. E. Griffith, Nodaway, Iowa.

I have attended the Graham Scientific Breeding School and find that it is all and more than they claim it to be. Breeders that do not attend this institution are standing in their own light.—W. L. Hill, Albany, Texas.

I have attended the Graham Scientific Breeding School and learned the wonderful value of this school, both morally and scientifically. Parents should send their boys to this school. I advise every breeder to attend this school.—Henry Jahnke, Montevideo, Minn.

I have learned many of the best lessons I ever learned in all my life at the Graham Scientific Breeding School. The "Dissecting of Barren Mares" is worth many times the tuition. I have received moral lectures that have made me a different man. When I reach home I can help my wife to raise those three little children right, and show them the right road to go.—Jno. Wilson, Wolf Creek, Ill.

I first attended the Graham Scientific Breeding School in December, 1910; did not learn all I wanted to, so came back December 16-21, 1912. The school was in its primary stage at the 1910 term, but was splendid even then, but the strides that their talented instructors have made on anatomy, physiology, hygiene and especially diseases of colts and young stock, is wonderful, and I can say that the Scientific Breeding School is all that it claims to be and more. I think every mare owner, as well as stallioner, should attend the next term, beginning January 13.—O. D. Corman, Decatur, Ill.

I have just attended the Graham Scientific Breeding School and feel that I have been benefited in many ways. There cannot be a money value placed upon the benefits which I have received. May the good work continue.—M. W. Magnuson, Safe, Mo.

I have again attended the Graham Scientific Breeding School and was surprised to find the wonderful progress it had made morally, as well as scientifically. I wish every breeder could attend. You cannot place a financial value on the instruction received at this school. —J. W. Shoekley, Ewing, Ky.

I have just attended my second term of the Graham Scientific Breeding School and will say that the one lecture on barren mares has many times repaid me for my time and all my expenses.—E. H. Parvin, Kidderville, Kas.

I have attended the Graham Scientific Breeding School and can say that the lecture on "Navel III" was worth far more alone than the price paid to attend the whole term. I would not take many times what it has cost me to attend for what I have learned. I think it is the duty of every American breeder to attend this school, whether he has stallions or not.—J. E. Griffith, Chillicothe, Mo.

I have attended the Graham Scientific Breeding School for which I feel richly repaid, as any one lesson is worth the whole cost of the trip. I feel that any breeder of horses or cattle should attend at least one term of this school. This is my second term and I find it not only very instructive, but the moral influence here is good.—H. L. Van Ornum, Forman, N. D.

I have just attended the Graham Scientific Breeding School, and have gained a great deal of valuable information about different things in horse breeding. I consider it well worth any breeder's time and money to attend a term of this school. —James Woodward, Atkinson, Ill.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demontrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot: get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL

225 West Twelfth St., Kansas City, Mo.

A Record Holiday Horse Deal

One Man Takes Over $200,000 Worth Out of This Territory—All Prices Stronger—Cattle Demands From More Different Sources Than for Years—Hogs Featureless; Sheep Higher.

At a time when the trade had announced that the dull season for horses and mules had possessed the market, a big Southern buyer assembled a bunch of 500 head at the Kansas City market and a larger number in St. Louis. This proved an alarm clock for all concerned and demonstrated beyond doubt that old things in the horse and mule trade have passed away. According to precedent no buyer had a right to put over such a deal in the dull season. But it occurred, and now holiday seasons can no longer be classed as a general season of dullness. One other point in connection with this deal is that the commission men who engineered the trade sought out the men who owned the animals and bought direct from them. C. L. Bevill, a Carolina trader, made the purchase, and his train load out of St. Louis, 35 cars, was one of the largest shipments ever made by one owner. Mr. Bevill says that the South this year will take more horses and mules than ever before. "They are wakening up to their producing possibilities and that requires greater horse power. The South now is much richer than it was a few years ago, and our increased manufacturing industries are requiring more raw material all the time." Most of the mules purchased by Mr. Bevill cost in the neighborhood of $200 a head, and shows that the South is alive to the advantages of good animals.

While this one deal was the biggest thing of the past few weeks in the market line, practically all the other horses offered found a ready outlet at firm prices. Some heavy drafters went East, and a good many farm horses were scattered out to various sections. Dealers say that they expect a general improvement in demand in the next few weeks, and that by February a large volume of business will be in sight. A good many farmers want brood mares, and the city trade is a constant outlet for the chunks and medium workers. Prices now are high, but a horse's earning capacity is also great.

In 1912 about 40,000 fewer horses were received at the five principal markets than in the year 1911. The equine branch of the live stock end of farming has become more important than ever before in the history of this country, first by reason of greater value as a market product, and secondly as a greater producer of wealth on the farm. The year 1913 should find farmers in an excellent position to produce better quality, and receive still greater returns.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up..	$225@285
Drafters,fair to good	140@220
Chunks, good to choice	125@160
Chunks, fair to good	85@120
Expressers and light draft	50@110
Plain workers	40@ 85
Southerners, good	120@135
Southerns, plain to fair	60@115
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 75@120
14 to 15½ hands	110@150
15½ to 16 hands	140@185
16 to 16½ hands	180@265

Unsettled Cattle Prices.

Christmas week cattle prices bounded up 50 to 75 cents, and in the past few days 25 cents of that advance was lost again, so that prices now are 25 to 50 cents above the lowest point of the season two weeks ago. In a general way the market seems unsettled. Receipts have been moderate, but killers are looking for the soft spots. The weakness in the past few days has been more on the heavy steers than the light weight kinds. Dressed beef men are trying to get the top quotations under $9.25, but there is outside demand for the long feed varieties and it is doubtful whether the $9.50 mark will be extinct during the next two months. The top price in Chicago this week was $9.60, and in Kansas City, $9. The short fed steers on the native side are selling at $7.25 to $8.50. Where much quality shows under the $7.50 mark, country buyers generally outbid killers. On the quarantine side, meal and hull fed steers are selling at $6 to $7.55. Most of them are coming from Oklahoma. Arkansas is still sending in some pastured cattle. Compared with a year ago prices for all classes are $1 to $2 higher, and general conditions favor the present price level. Countrymen say that cattle on feed are making remarkable gains, owing to the excellent quality of the grain, and the unusually mild weather. They are being marketed closely and with anything like a normal beef demand in the next few weeks the market for cattle should continue good. Practically all the cattle coming are of one class, showing different flesh according to length of feed. The scarcity of low priced cattle is pronounced and the spread in prices now is nearly $3 smaller than a month ago. Prices are practically $6.50 to $9.50, compared with $5 to $11 a month ago.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.75@9.50
Good to choice steers	8.00@8.75
Fair to good steers	7.50@8.00
Common to fair steers	6.00@7.50
Meal fed, choice	7.25@7.85
Meal fed, common to fair	6.00@7.20

Butcher Cattle Very Scarce.

For this season of the year butcher cattle are scarce. The letup in the range movement and the windup of the native "canner" supply has narrowed receipts to small proportions. Few fed heifers are coming, and good cows are being held for breeding purposes. Where a bunch of heifers shows up that killers could use at low figures, they are nickeled out by country buyers. Killers are no longer the whole thing in the cow trade as in former years, but they have to meet the competition from the country buyer, the small butcher and shipper. Consequently prices are very firm, and in all probability will contine so. Bulls are higher, and veal calves are strong.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.50@7.50
Fair to good	5.00@6.40
Common to fair	4.00@4.95
Canners	3.50@4.00
Heifers—	
Choice fed	$8.00@ 8.50
Good to choice	6.50@ 8.00
Plain to fair	5.50@ 6.45
Common	4.50@ 5.50
Veal calves	4.50@10.00
Bulls	4.00@ 6.50

Countrymen Need Thin Cattle.

The market for stockers and feeders continues active at firm prices. Countrymen are short on cattle, long on feed, and there are few cattle available. In the past two weeks all the thin cattle offered have sold readily at strong prices. Owing to scarcity, and an increased demand expected later, higher prices will come before many cattle are bought for spring pastures. Increased breeding operations will not tell on the supply for another year at least.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.35@ 7.85
Good to choice feeders	6.75@ 7.30
Plain to fair feeders	5.85@ 6.70
Selected stockers	6.75@ 7.25
Good to choice stockers	6.25@ 6.70
Plain to fair stockers	5.50@ 6.20
Stock calves	5.00@ 7.50
Stock cows	3.65@ 4.65
Stock heifers	4.00@ 5.50
Milch cows	35.00@90.00

Hog Market Still Sticky.

No important net change has occurred in hog prices in the past two weeks. Prices have fluctuated 20 to 25 cents, but for some reason they were unable to make any headway up or down. Packers now are fighting the $7.50 level as ardently as they did the 8-cent level a month ago. The comparatively big run in December weakened the market beyond expectations, but that supply proved a heavy drain on current receipts. January receipts this year at the five Western markets are expected to fall 150,000 short of the same month last year. A good many traders say that they expect a liberal supply of heavy hogs in April, but all estimates for the February and March supply are light. The quality of the hogs coming now is only fair. Packers are still operating on a fresh pork basis, and this is the season of the year when they should be accumulating product. Stocks of meat are low and will have to be replenished in the next two months.

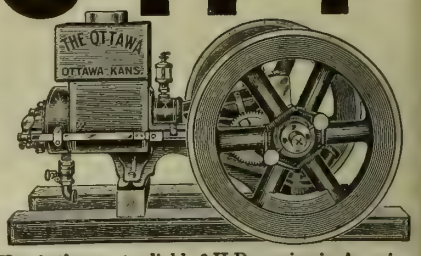
The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Dec. 30..	$7.00@7.45	$7.15@7.42½
Tuesday	7.00@7.45	7.15@7.45
Wed., Jan. 1..	7.10@7.45	holiday
Thursday	7.00@7.45	7.20@7.52½
Fri., Dec. 27..	7.20@7.55	7.05@7.35
Saturday	7.00@7.35	7.10@7.40

The following quotations are for hogs:

Choice, 250@300 lbs.	$7.35@7.45
Choice, 200@245 lbs.	7.20@7.42½
Medium weight	7.15@7.40
Light weight	6.40@7.10
Common to fair	5.75@6.65
Stags.	5.60@7.15
Boars	4.25@6.75
Bulk of sales	7.20@7.40

Strong Prices For Sheep.



Sheep prices are 50 to 75 cents higher than two weeks ago, and the highest this season. Lambs are well into the eight-cent level, and sheep are above the $4.50 mark. Packers are buying freely and current receipts are barely up to the demand. The movement of fed sheep is well under way and the quality is good. Countrymen are buying the half fat kinds for further feeding. Choice lambs are quoted at $8.25 to $8.65, fair to good $7.75 to $8.25, yearlings, good, $7 to $7.50, fair, $6.50 to $7; ewes, $4.50 to $5; wethers, $4.75 to $5.50. Some half fat lambs sold at $6.75 to $7.50 to go back to the country.

Live Stock Receipts 1912.

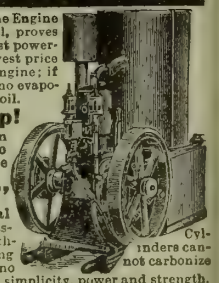
Live stock receipts for the year 1912 at the five principal markets show an increase of about 324,000 sheep, and decreases of 565,000 cattle, and 800,000 hogs. Kansas City, Omaha, St. Joseph and Chicago showed the decrease in cattle, and St. Louis an increase of about 100,000. In hogs Chicago, Omaha and St. Joseph an increase and St. Louis and Kansas City decreases. The number of stock marketed at the respective points was controlled to a large degree by the severity of the drouth in their respective trade territory in 1910, the winter of 1910-11, and the fatality of hog cholera during the past eighteen months. That receipts of hogs in Kansas City and St. Louis fell 1,200,000 short shows that in the past eighteen months production has been greatly curtailed in contiguous territory. Omaha gained the most hogs and was out of the infected district. The lesson of 1912 with its shortage in supplies, and an increased demand is that farmers will be wise to produce more live stock. Prices are such that all three classes of meat animals are profitable; an abundant grain crop cannot be utilized without them, and land cannot be kept up to productive possibilities without them. The total receipts at the five Western markets for the year were 8,011,000 cattle, calves included; 16,853,600 hogs; 12,912,000 sheep.

A good pair of draft mares is a good asset on any farm. Besides what they earn at work a pair of mule colts or high grade draft colts will bring 40 to 50 per cent on the value of the mares.

6 H-P

Here's the most reliable 6 H.P. engine in America. I absolutely know that it will wear longer and do more work than any other engine of the same size you ever used. That's why we can say to you TAKE IT—USE IT. Send us just one-half of the purchase price or only $59.75 and the balance to suit yourself, small monthly payments or a six month's note, just as you like.

No Limit Guarantee!



Every OTTAWA ENGINE is guaranteed to be perfect in construction and the greatest value that you can secure anywhere for the money. If it should ever prove defective in any way, **we will make it good.**

Big 48 Page Catalog FREE!

If you are thinking of buying an engine, any size from 1½ to 12 H. P. don't invest a single dollar until you get our prices—the lowest you ever heard of—and our big 48 page four Color Special Engine Catalog. It will save you from $20 to $100 sure. FREE—Send for it today. Address,

GEO. E. LONG, General Manager.
OTTAWA MANUFACTURING CO.,
1123 King Sreet, Ottawa, Kansas.

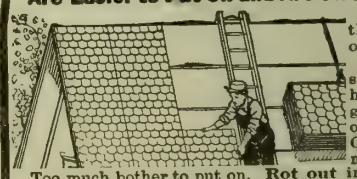
Use KEROSENE Engine Free!

Amazing "DETROIT" Kerosene Engine shipped on 15 days' FREE Trial, proves kerosene cheapest, safest, most powerful fuel. If satisfied, pay lowest price ever given on reliable farm engine; if not, pay nothing. No waste, no evaporation, no explosion from coal oil.

Gasoline Going Up!

Gasoline is 9c to 15c higher than coal oil. Still going up. Two pints of coal oil do work of three pints gasoline.

Amazing "DETROIT"



—only engine running on coal oil successfully, uses alcohol, gasoline and benzine, too. Starts without cranking. Only three moving parts—no cams—no sprockets—no gears—no valves—the utmost in simplicity, power and strength. Mounted on skids. All sizes, 2 to 20 h. p., in stock ready to ship. Engine tested before crating. Comes all ready to run. Pumps, saws, threshes, churns, separates milk, grinds feed, shells corn, runs home electric lighting plant. Prices (stripped), $29.50 up. Sent any place on 15 days' Free Trial. Don't buy an engine till you investigate the money-saving, power-saving "DETROIT." Thousands in use Costs only postal to find out. If you are first in your neighborhood to write, you get Special Extra-Low Introductory price. Write! (138)

Cylinders cannot carbonize

Detroit Engine Works, 203 Bellevue Ave., Detroit, Mich.

Don't Fool With Wood Shingles

Buy STEEL Shingles
They Cost Less, Last Longer, Are Easier to Put On and Are Fireproof

This is the Age of Steel. Wood shingles have gone out of date. Cost too much.

Too much bother to put on. Rot out in a few years. And they multiply by 10 the danger of fire.

Thoughtful men are nailing STEEL Shingles right over their old wooden roofs.

And those putting up new buildings are likewise careful to choose STEEL SHINGLES.

Edwards STEEL Shingles

come in big sheets of 100 shingles or more. Don't have to put them on one at a time like wood shingles. Just nail the whole sheet right over old roof or on sheathing. No extras, no painting, no tools needed. And money can't buy a more handsome roof.

Absolutely Rust-Proof

Don't judge Edwards Steel Shingles by common galvanized iron roofing—the kind that rusts. We have invented a method that absolutely prevents rust from getting a foothold, as 100,000 delighted owners of Edwards Roofs have found. It's the famous Edwards Tightcote Process.

Protection From Fire

Don't take chances of fire from defective chimneys, flying sparks and lightning. Roof your buildings with these STEEL Shingles and make them safe. Remember, nine out of every ten fires start with the roof. We specifically guarantee every Edwards Steel Shingle Roof against lightning. This guaranty is by a $10,000 Cash Bond.

Write for Special Factory Prices —Freight Prepaid

We sell direct from factory to user, thus saving you 40%. And our business is so big that we cut our profit-per-sale to about half the maker's usual profit. And we pay the freight. Amazing as it may seem, these STEEL Shingles actually cost LESS than wood shingles.

Send postal at once for our latest Roofing Book No 176 and Special Factory Prices. Give size of roof, if you can.

THE EDWARDS MANUFACTURING CO.
126-176 Lock Street (91) Cincinnati, Ohio

Feed—Our Weakest Point

Undoubtedly the most important single factor in the improvement of farm animals and the development of desirable breeds to a reasonable degree of perfection, is feed. In giving feed this credit it is, of course, necessary to include with the term, judgment and care in feeding, but it is the quality and quantity of feed more often than anything else that is lacking, and it is a better realization of the importance of quality and quantity of feed more than anything else, which must come to the stock men of this country before they can make the progress in animal husbandry which its importance and the money invested in it justifies.

The hundreds of thousands of dollars which every year go to the countries of Europe for imported draft horses is a tribute more to the superiority of the feeding methods of the old country breeders than to the superiority of the blood they use. American breeders, as a rule, are second to none in their willingness to spend money for good breeding stock, but there is a widespread lack among breeders and a more nearly universal lack among the farmers (who are the ultimate customers of the breeders) when it comes to developing the produce of the well bred animals which have been secured.

In France, for instance, it is the rule to full feed colts in developing for breednig animals, giving grain to foals, yearlings and two-year-olds in connection with luxurient pasture, colts of the latter classes getting as high as 25 pounds per day on grass. In this country it is the exception. A very large proportion of the colts raised in this country get no grain while nursing excepting what they pick up around the feed boxes of older horses. As yearlings they spend a long season pasture (often including as much as two months of short grass and hot weather), during which time they get no grain whatever. As two-year-olds they are very likely to be roughed through the winter without grain, passing through the period of greatest importance perhaps in their development, with the least opportunity for development. The result is that the average colt raised on the American farms is not ready to go to work until it is four years old and at that age is no larger than it ought to be at two. It is a little tougher from age and may endure more work than it would have as a two-year-old, but the chances are that the extra difficulty of breaking a four-year-old more than offsets any advantage it has in the matter of endurance.

Those of us who have made a point of attending state fairs where good draft horse exhibits are made, and visiting the barns of some of the best breeders and importers, have seen hundreds of two-year-olds weighing from 1,550 to 1,850 pounds, and this without excessive flesh, as the colts are still growing and do not fatten easily. There is absolutely no reason why all the breeders of this country who have taken pains to put good blood into their studs, should not make these same weights, granting, of course, the necessary time to learn successful methods of feeding or to secure the help of other successful feeders.

Year after year American importers bring from France, Belgium and England shiploads of registered draft stallions, including some of the best horses there produced, as is shown by the prize winnings of such horses at their home shows and again when they reach this side. We cannot claim that we have not the right kind of breeding available; it is largely a question of feed and has been so since the beginning of draft horse breeding in this country.

The same thing is true with cattle, and perhaps even more so. No one realizes until he stops to think it over, and then not unless he has had opportunity for wide observation, how our cattle growing methods have suffered from the early day range conditions, in which pasture and foundation stock was so cheap as to be very lightly considered. In the corn belt of this country where land is now high and labor scarce, and nothing but a good animal can be depended on to pay for its keep, there are thousands of localities where well posted farmers will tell you that the average beef making quality of the cattle is lower than it was 25 and 30 years ago.

Of course, various causes have contributed to this condition, but through it all the greatest cause has been the failure to feed in such a way as to develop the farm stock and thereby cause it to be money making. When a farmer carries a herd of so-called beef cattle year after year, and through the fault of his methods or the lack of quality in the animals, or both, fails to make any money, he becomes, as a rule, more careless both in the matter of feeding and breeding. If right feeding methods had been practiced in the beginning, better stock would have been available to him in the first place and good care would have made it bring him a profit.

The only way to get from beef stock the profit it has a right to yield is to keep every animal growing from birth as rapidly as it can be made to grow without impairment of its digestion. If it is started right and handled with judgment it can have practically all the plain feed it will eat, and the better and more regularly and more constantly it is fed, the less waste there will be. No one questions any more that early maturity is essential to the best profits, not only in beef stock, but in almost all kinds, and early maturity is only possible where good care is given right from the start.

In the history of the corn belt, particularly with the western portion of it, millions of cattle have been "roughed through" the winters, as we call it, with the result that they come out in March weighing less pounds than when they began the "roughing" period at the close of the grass season about the last of October. The annual waste from this cause alone, if we could have the figures on it, would be almost unbelievable, yet the fact of it cannot be doubted, and many a stock man has made the discovery through the use of his own scales after having repeated this bad practice year after year.

The question has often been asked how is it that a few small sections of England (more like the counties of our states than like the states of our Union) and similar sections of France, Holland and Belgium, have for half a century been sending improved blood to this country, and are yet still far ahead of us in the average standard of their live stock. The answer to this question is that they have fed and cared for their animals as farm animals should be fed and cared for, while we have allowed millions of dollars worth of good blood to deteriorate largely for lack of feed. Breeders and exporters of the old country who realize the wealth of foundation stock which has been brought here from their studs and herds, are amazed when they come to this country with its practically limitless facilities for growing feed, to find that chiefly from lack of feed there seems to be a constant deterioration which has to be offset by the importation of new blood.

There are all through the country west of the Mississippi, stock raisers and farmers who do not practice as good methods of feeding and care as their grandfathers and great grand-

How to Train Scary, Vicious, Balky, Tricky Horses and QUICKLY DOUBLE THEIR VALUE!

Write for Prof. Jesse Beery's FREE "HORSE-TRAINER'S PROSPECTUS"

If you are the owner of a vicious, tricky, kicking, balky, dangerous and unsaleable horse or colt, don't get rid of the horse—get rid of its bad habits. Write for Prof. Jesse Beery's "Horse-Trainer's Prospectus," a large, handsome, illustrated book written by the

King of World's Horse-Trainers

Prof. Jesse Beery won world-wide fame and was tremendously successful giving exhibitions of his marvelous skill in mastering man-killing stallions, training wild horses to drive without bridle or reins. The whole country was thrilled by his daring deeds.

Secret of His Power Revealed at Last

In the grand Free "Horse-Trainers' Prospectus" Prof. Beery now reveals the secret of his power and shows the way to duplicate his dazzling success.

Prof. Jesse Beery

What His Graduates Have Done

Prof. Beery's Correspondence Course in Horse-Training and Colt-Breaking is the only instruction of the kind in the world. Thousands of his graduates are reaping the profits and benefits of his wonderful course. For example, take the case of Emmett White, Kalona, Iowa, now a prosperous professional horse-trainer. Mr. White says: "I wouldn't take $70 for what you have taught me. You may judge of my success when I tell you that I have been able to buy a home and an automobile solely through earnings from training horses as taught by your excellent methods."

Buys "Man-Killers" Cheap, Trains and Re-Sells at Big Profit

A. L. Dickinson, Friendship, N. Y., writes: "I am working a pair of horses that cleaned out several different men. I got them for $110, gave them a few lessons and have been offered $400 for the pair."

S. M. Ryder, Mercersburg, Pa., writes: "I am making money buying 3-year-old kickers cheap, handling them for a few days and selling them, perfectly broken, at a large profit."

So it goes. Everywhere, Beery's graduates are making money as trainers and "traders," giving exhibitions. Write and we will tell you about more of them. It's intensely interesting.

Train a Colt in 8 Hours!

You can do it by the Beery System. There is lots of money in breaking colts. The field is unlimited.

Bang! Bang! Bang!
The Beery System Drives Out Fear

Retires from the Arena—Now Teaching Horse-Training by Mail

Prof. Beery has retired from the arena, after a career of unparalleled success, and is devoting his time to teaching his methods to a limited number of selected pupils—both men and women—by correspondence.

Graduates Making $1,200 to $3,000 a Year at Home or Traveling

The wonderful success of Prof. Beery's graduates—taught by mail at home during spare time—proves beyond question the value of his instruction. People gladly pay his graduates $15 to $25 a head to have horses tamed, trained, cured of bad habits, and colts broken to harness.

A Penny Postal May Make Your Fortune

No matter who you are or where you live, if you love horses and are ambitious to earn more money in a profession you will be proud of, write for the wonderful Free "Horse-Trainer's Prospectus" today, without fail. Tell me all about your horse.

PROF. JESSE BEERY, Box 13, PLEASANT HILL, OHIO

Price $20.00. $17.50 for the first order from Town-ship. ½ less draught than any machine made. 1 Machine to Tp. cut rate. Agents wanted.

Sold on 15 Days' Trial.

D. B. GUNN. Red Oak, Iowa.

fathers did in Virginia, Kentucky, New York, Ohio and other eastern states from which our race of stock men came. It is possibly all right to blame this condition upon the careless methods which came into vogue a generation or two ago when our prairie pasture was limitless and live stock could roam and propagate at will, but there is absolutely no excuse for failing to realize that a gigantic change of conditions has for nearly a score of years demanded the return to methods in keeping with the constantly increasing cost of every item that enters into the production of these animals. There is not greater work now confronting the extension departments of the many agricultural colleges of this land than the work of showing the farmers and stock men right on their farms, how to feed, when to feed, how much to feed and how seriously they interfere with their own interests when they fail to feed as they should.

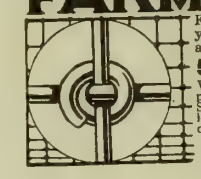
EUGENE RUST, AND THE STOCK YARDS.

Notice in the daily papers that E. V. R. Thayer had been elected temporary president of the New Kansas City Stock Yards Company of Maine, has caused a misapprehension in many quarters. The New Stock Yards Company of Maine is simply a company organized to act temporarily as the owners of the stock purchased from the old stockholders of the Kansas City Stock Yards Company by the new interests represented, and does not directly conduct the affairs of the Kansas City Stock Yards Company. The old officers of the company still hold their places, with the exception of the General Manager, Eugene Rust, deceased. The recent death of Mr. Rust makes no change in connection with the Stock Yards Company's business, as his prolonged illness has made necessary the carrying on of his work by other officials and his assistants.

In the ten or 12 years Mr. Rust was general manager, he made a host of friends among the stockmen and breeders of this territory. It was his part, as a rule, to represent the Stock Yard Company in all its relations with the American Royal Live Stock Show, and this further widened his list of personal (as well as official) friends, all of whom sincerely mourn his loss.

DIDN'T WIN THE $1,000 REWARD.

Although 1,200 applications were made for it, no one was able to land that $1,000 reward offered by Governor Stubbs of Kansas for an effective cure for the horse epidemic which swept the western plains last fall. Not one of the "remedies" offered them were considered certain of curnig the disease. All treatments proposed were turned over to the veterinary department of the Kansas Agricultural college where they were passed upon by the veterinary experts.



THAT NEW FERTILIZER SUPPLY.

The recent discovery of potash deposits in California is of much greater importance than those of us living in the newer sections of this country can realize. For many years farmers of the Eastern and Southern states have counted among their principal expenses the purchase of fertilizers, and potash is one of the elements for which they have had to pay most dearly.

Until now, practically our entire supply of potash for fertilizer has had to be imported from Germany, and it was a recent controversy with Germany, caused by the levy of export duties by the country on this fertilizer ingredient, which started our government to looking for a supply within our own borders. The deposit of the mineral which was found is in the Mojav desert in the southern part of California, and is said to be of good quality, that is, it is in the form of a mineral which will dissolve readily enough in the presence of warmth and moisture to make its potash available for plant food. Other deposits which have been found by the Department of Agriculture proved to be only partially soluble, or of such a nature that expensive chemical treatment was necessary in order to make them useful as a fertilizer. The new deposit is in the bottom of a dried up lake which has received the drainage from the surrounding hills for thousands of years, vast quantities of dissolved minerals thus having concentrated in it. Similar dried up lakes containing valuable deposits, it is believed, exist elsewhere in the arid regions and will be sought.

If you would have a trusty old horse train him when a colt. Every colt should be halter broke while very young and he will never forget it.

Price** **$2.95**

CAL HIRSCH & SONS

U. S. Dept. 212 **ST. LOUIS, MO.**

The Relation of Inbreeding and Constitutional Decline

It is very probable that the delicate constitution possessed by considerable numbers of the commercial stock of the country is due to in-breeding, a system which is carried on, not, in most cases, on any fixed principle or with any definite object in view, but simply through force of circumstances or, perhaps, want of thought. On many farms a good, useful bull is purchased at what is considered a fairly big price, and the purchaser is anxious to make the most of him, and he is used in the herd too long. His own stock come round in due course, and the farmer can not afford to keep two bulls and wants to get a bit more out of the old one, so the bull is often put to his own daughters, or perhaps a useful youngster may be saved and kept for use in the herd and be bred to his own sisters. Once in a way this kind of thing may not do much harm, but it often happens that this sort of incestuous mating is carried on from time to time, and the constitution of the stock naturally becomes impaired.

In the breeding of pedigree stock inbreeding may be carried on up to certain limits for a certain definite purpose, but in the breeding of ordinary commercial stock there is no justification at all for pursuing that system. The object of all breeders of store stock should be to endeavor to obtain robust constitution. Graziers, feeders and dairy farmers, as well, require stock that can stand our changeable climate without constantly taking colds and chills, and that can stand high feeding, or, for that matter, if keep is short, can keep their backs up when on short rations, and that can digest and assimilate their food in a proper manner and turn it to good account. Weakly stock can never do this, and as in-breeding, if carried too far, is bound to produce weakly stock, breeders should be careful to use as much as possible sires that are unrelated to their own stock. Things are different now to what they were in the old days.

Pioneer Work.

The pioneer breeders of British stock were limited in their choice of sires. There were only a few herds that they could draw on for fresh blood, and even then they were in many instances closely allied to their own; but then their own stock was hearty and vigorous to begin with, and they carried on the principles of in-breeding with a definite object in view, viz., to fix type and characteristics. With the number of pure bred herds in existence at the present day, and with the types and characteristics of the different breeds already fixed, there is no necessity or excuse for carrying on any indefinite system of in-breeding.

Good animals of any type can now be bought at a reasonable price to suit the requirements of any herd, and to sacrifice robustness of constitution in the young stock just to save a few dollars in the purchase of a fresh sire is a penny wise and pound foolish policy. It must always be borne in mind that if a herd of any kind has any particular defect, in-breeding is sure to bring out that defect more prominently in each generation. In addition to that, the results of in-breeding are generally infertility and general weakness.

Calves are born into the world that can not stand their own mother's milk, and scour and die. Some are born rickety and never come to maturity; others are always wanting physic in some way or other. Size, too, is very often sacrificed by in-breeding, and with regard to the keeping up of size in either a herd or flock, fresh blood from time to time is bound to play an important part. A well known sheep breeder once told the writer that the only way he could maintain a certain standard of size in his flock was by introducing a few ewes from other flocks into his flock every year, just half a score or so, and he considered that this introduction of fresh blood on the female side as well as on the male side was a very considerable factor in maintaining the size and constitution of his flock. And in mentioning this, the same principle applies equally in the case of sheep or horses as to cattle. If a flock is too closely bred for some length of time, size and constitution are both lost. Thus it is that in many pedigree flocks where it is thought that type must come before everything, in-breeding is carried on to a great extent, and we often see some of our purest bred flocks consist of sheep that are fine in bone and with small frames, delicate in constitution, finding no favor with farmers. Type in pure bred stock is, of course, of the utmost importance, but by skillful breeding it need not be lost by an occasional change of blood from another flock equally as well bred.

In-Breeding and Prepotency.

It is generally thought that an in-bred sire is almost always prepotent to a great degree and one most desirable. In the case of horses; the writer has known many instances where such a sire has been so; in fact, some of the best sires ever known amongst Shires have been in-bred, and in thoroughbreds also, the great stallion, Wisdom, for example. But, on the other hand, in-bred bulls have been in many cases dismal failures and their produce not worth rearing. This, of course, applies to the present day. In the days of Belindae it was different. There are many people who maintain that it is impossible to breed stock up to a definite standard and maintain that standard without in-breeding. That was no doubt true sixty or seventy years ago when the field of selection was extremely limited, but it can not apply now, when selection is practically unlimited. Having once fixed a certain standard or type by a system of in-breeding, it must be a case of careful selection and skilful mating to keep up that standard, but there is no necessity nowadays for selecting and mating only closely related cattle. There is a wide range, and plenty of animals can be found in other herds, either unrelated or, at any rate, very distantly related that will answer the purpose for which they are required. Then, again, it is sometimes argued that in-breeding can be indulged in with impunity, provided the most careful selection is made in the mating of the animals, that is to say, by breeding only from those that show signs of the most robust constitutions and that have no defects of any kind.

That theory may be all very well for a time, but what a constant weeding out there must be; so much so, that a herd bred on these lines can never increase, but must sooner or later dwindle away. In a very in-bred herd the time is bound to come when, from sterility, weakness and other causes, the animals fit to breed from become fewer every year and the wastage greater. In-breeding is just useful nowadays to establish some special feature, but whether that special feature is worth the sacrifice is another matter. Breeders often wish to bring out some special feature in their stock and by a few years of in-breeding and careful mating they establish that feature, and when once established it is not necessarily lost by the judicious employment of fresh blood. On the other hand, the special feature often becomes more prominent.

So Far and No Further.

By a certain amount of in-breeding it is thus possible to improve certain points in our stock, but on the other hand it is more likely to bring out undesirable characteristics, such as want of bone and size, sterility and delicacy of constitution. On the whole, therefore, in pedigree herds it is best to guard against any system of in-breeding as far as possible, but in the breeding of commercial stock there can never be any justification for it whatever. The ideal of the producer of good stock should be to produce animals with size, quality, and constitution, that will live where others will starve, and that will turn the food given them to the best account. This sort of stock will never be raised by a careless system of in-breeding, and so long as the sires used possess the characteristics which the breeder wishes to bring out in his stock, it matters little what their pedigrees are from a commercial point of view, so that they are unrelated, or very nearly so, to the previous sires used; and that brings up one little point, which is, the importance of breeders of commercial stock studying the pedigrees of the sires they use, otherwise they may inadvertently purchase a fresh sire which may be so closely related to the previous one as to do an infinite amount of harm if used too freely.—T. B. G., in Farmer and Stockbreeder, England.

"As Many Inquiries as I Can Handle."

To the American Breeder:—Since writing you to change ad, I have had as many inquiries as I can handle, so please omit ad after this time and send me account for the two insertions. Have several propositions that look promising.—STANLEY TURNER, Tom Green County, Texas.

WHAT BREED OF POULTRY AND WHAT CARE?

To the American Breeder:—This problem confronts every poultry raiser who is a beginner as well as those who have been breeding for years without getting the results expected. Now, we want to say right here it is not so much the breed but the party who is caring for the particular breed that counts. No one can get best results from any variety unless, in the first place, they admire that variety and they must bear in mind especially when selecting their breed, for what purpose it is wanted, and we believe after giving careful consideration we should be able to put up a forcible argument and give a good, sensible reason why we keep certain varieties. We breed Black Langshans because we believe and have found them to be the best winter layers as well as furnish such a great amount of rich juicy, tender meat, both for market and table use, and if called upon we could give a great many more reasons for keeping them, and good ones. However, we are not trying to argue with you to keep any particular breed. We have friends who breed other varieties and get good results because they like that kind and try for best results. We have bred several varieties and have selected what suits us best. We would advise beginners,

(Continued on Page 16)

To the American Breeder:—Please continue my chicken ad until I write you again. Am having fine success with it and am well pleased.—Mrs H. A. Brookhart, Scotland County, Mo.

PURE BRED POULTRY.

QUESTIONS AND ANSWERS.

(Continued From Page 5)

sible. As a rule the application of a little mercurial ointment to the affected parts which may be gently rubbed in, and the excess wiped off with a clean cloth, has a good effect. The skin needs to be encouraged to again regain its soft, pliable state by the application of agents of this class. The animal should not be given hard road work for some time.

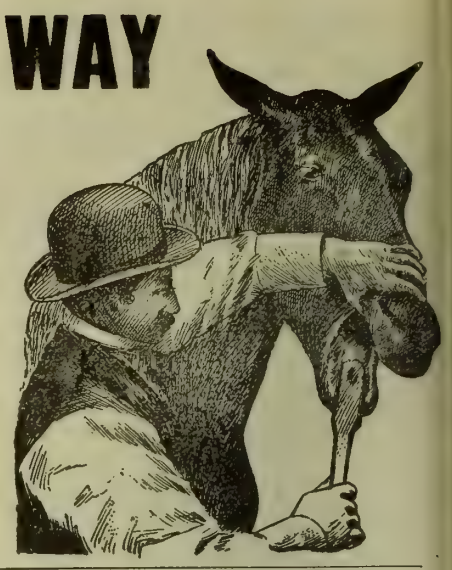
INJURED FOOT—I have a three-year-old mule which weighs 1200 pounds, which is a dandy, but when she was a colt the mare stepped on her foot and deformed it a little, though I am improving it by shoeing, but there is something like a running corn; resembles a fistula of the foot. There is a hole in the sole of the foot a half inch from the frog and an inch or an inch a half from the heel of the frog, or usual corn seat. There is a little pus comes from this and it makes her lame. If there could be any information or a cure for this mule, I would be pleased to get the same.—Idaho Subscriber.

REPLY—Pare away the horn sufficiently to expose the fistulous tract and explore it fully, for you may find some foreign body imbedded in the deeper parts. If this is carefully done an occasional injection of tincture of iodine by means of a hard rubber syringe should effect a cure.

VACCINATING HOGS AGAINST CHOLERA—Please tell me how to vaccinate hogs; how it is done; what medicine is used and where on the hog it is done.—Indiana Subscriber.

REPLY—Vaccination has proved the most effective means thus far known for preventing hog cholera. A serum prepared by various laboratories is the article used, and it is injected into some part of the hog's body by means of a hypodermic syringe. When the injection is properly done and a good grade of serum is employed hogs may be made immune for a limited period to the disease. A more permanent immunity may be conferred by permitting such vaccinated hogs access to infected premises or giving them at the same time or shortly afterward an injection of virulent blood. The veterinary department of your state agricultural experiment station should be in the best position to give you such further special instruction as you may need.

CONTRACTED TENDONS—I have just bought a colt coming three years old that has never been roaded or worked, but has been tracked some. He teeters on his knees at times but can stand as straight as any horse. Would it be advisable to have him shod with tips? I have been advised to bathe the parts with two parts alcohol and one part olive oil. What do you think of this, or what would you recommend?—Ohio Subscriber.



REPLY—While it may be maintained that this colt has never been worked it would appear that in his young state he has had sufficient service to cause an inflammation of the back tendons sufficient to cause a contraction of the same, and if the condition is not relieved it will very likely result in a state ordinarily known as knee spring. We do not believe you are justified in continuing this young animal in service, but should give it six months or a year's run at pasture. During this period a daily application of alcohol and witch hazel, equal parts, to the region back of and above the knee, will be of aid in strengthening and relieving the threatened condition. Let the application be well rubbed in. Many promising young animals are ruined by being put into service during an immature state.

SWOLLEN LIMBS—A neighbor of mine has a mule that is supposed to be bank poisoned, in coal mines. The mule's hind ankles swell from feet to above ankles very much, and one of them runs a white watery discharge most of the time. Can the mule be cured or helped? What can be done for it.—Tennessee Subscriber.

REPLY—This affection is very difficult to overcome and it usually requires more attention than the average individual is willing to give to effect improvement. The animal should be kept free from everything of an irritating nature, such as mud or stable filth, and if not worked should have an opportunity to take exercise at will. As a rule it is better to permit such an animal access to a shed with lot or pasture connections rather than put it in the barn. Daily applications of sugar of lead solutions to the parts (one ounce to one pint of water) will help overcome the condition.

COUGH—I have a mare that has a cough and has had for about six months. It comes on and then it stops. Is there anything I can do for it. This is a good mare and if you can help her I will be very glad.—Kansas Subscriber.

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.

REPLY—One needs to know the cause of chronic cough before attempting to prescribe for the same inasmuch as cough is only a symptom of some abnormal state or disease. In some cases the act of coughing is helpful in overcoming the disease, as for instance, in such diseases as result in more or less exudation into the larynx, trochea or bronchiel tubes. One should always be careful that the cough is not caused by exposure, or a dusty or moldy food supply. In an animal already weak in the organs affected it only requires a small amount of dust in the hay or grain to make cough a constant annoyance. Try the following: Ammonium chloride one ounce, glycerine six ounces, fluid extract of licorice four ounces, water to make one quart. Give one ounce of this mixture with a syringe three or four times a day.

HEMMORRHAGE FROM MARE—One of my neighbors bred a mare to my stallion June 4, 1912, and is in foal, but the last month she has been passing blood. What would cause it? She has not lost her colt; has not been worked since harvest; she is running on clover and timothy pasture stock field and can run to an oats straw rick; plenty of water and salted regularly. Has not been in the barn at all this fall and is in good health generally.—Indiana Subscriber.

REPLY—It would be very difficult to guess the source of the blood in question, and for the present at least we think the mare had better be left alone unless the amount passed becomes alarming, or other untoward symptoms develop. Too much meddling may result in an abortion. The blood may come from the bladder on account of the presence of gravel or ulcerated state of its mucous membrane. Again there may exist attached to the vaginal wall certain soft tumors which bleed easily. Should she carry her foal to a safe termination and the hemorrhage continues, you should then by all means have her examined by a qualified veterinarian with a view of having the trouble corrected.

HARTSHORN LINIMENT — Please tell me how hartshorn liniment is made; I mean what drugs do you mix and how it is done.—Indiana Subscriber.

REPLY—We presume you refer to a combination of ammonia water, turpentine and olive oil, which makes a pretty good cheap liniment. Take ammonia water 1 ounce, oil of turpentine 2 ounces, and olive oil 13 ounces. Shake the agents well together.

ENLARGED KNEE—I have a neighbor who has a work horse and he has on one of his front knees a large lump which covers his entire knee joint. It seems to be a bag full of water and is getting larger all the time. Sometimes the horse is lame and at other times he doesn't seem lame of any consequence. The lump or enlargement has been coming for about four years and gets larger all the time. Could you tell from this brief description what it is, and give a remedy for same?—Texas Subscriber.

REPLY—We fear that the condition complained of involves the synovial apparatus of the joint and you should call in a well qualified veterinarian who should be able to decide this point. It is more than likely that the fluid needs to be aspirated and drawn off and perhaps a strong vesicant applied or the firing iron used.

The most important mule states are Missouri, Texas, Kentucky and Tennessee, with Missouri in the lead and with St. Louis the most prominent mule market in the world. Mules are known in the market as sugar mules, cotton mules, lumber mules, railroad and mine mules. Mules generally live to a greater age than horses.

Lamer's Percheron Stallions and Mares

75 head of imported and home-grown Percheron Stallions and mares at "let live" prices. Two year olds that weigh a ton.

Cheaper Money For Farming

Government Finally Getting at the Financial Difficulty in its Efforts to Increase Agricultural Production in the United States. Foreign Plans Being Studied.

Cheaper money for the borrowing American farmer is the object of an investigation recently undertaken by the State Department of the United States through five of its ambassadors in Europe.

In Americe the farmer today pays a higher rate of interest for his money, proportionate to the security which he offers in his farm-land mortgage, than almost any other class of investors in the country. In Europe the farmer borrows on equal terms with the biggest railroad, industrial corporation, or municipality.

When the work in Europe is completed the State Department will prepare an organization plan to fit the scheme to American conditions and a legislative program will probably be mapped out for the president to submit to Congress. The investigation is centered about the Credit Foncier of France and the Landschaften of Germany.

The Credit Foncier is a limited liability company operated under the supervision of the French government for the purpose of lending money to public-service corporations, communities, counties, and landowners, and to create and negotiate bonds based on mortgages which are limited to the amount due from the lender. In other words, the Credit Foncier acts as an agent for the French farmer, so that instead of seeking to raise money directly from some local investor by mortgaging his farm the farmer places his mortgage with the Credit Foncier, which in turn issues a bond based upon that mortgage and which can be sold anywhere throughout the country. In this way the French farmer is freed from the necessity of borrowing in the limited market of his own immediate vicinity.

It is just this restriction which is forcing the American farmer to pay exorbitant rates of interest and to put up with none too acceptable terms. In this country the farmer is practically forced to borrow from some investor in his own community. If local conditions make money "tight" there he suffers accordingly. In one section of the country he pays 6 per cent interest and in another 10 per cent, though in both instances the security offered may be the same. Never can he compete with the bonds of the big industrial corporations, though in many instances the security which he offers is just as good as that of the corporation.

Two classes of loans are offered to the French farmer by the Credit Foncier: Short-time loans, running from one to nine years; and long-time loans, running from ten to seventy-five years. The rate of interest which the French farmer pays is only 4.3 per cent per annum. Loans are made on first mortgage security only and the loan is limited to one-half the total valuation of the property upon which it is made. On the short-time loans the borrower pays only the interest due at the end of each year and at the expiration of the loan pays back the principal. In the case of long-time loans, however, he is given better terms. The principal in such loans is paid back in annuities, which are paid together with the interest nuities are spread over the entire due at the end of each year. The anperiod of the loan so that in the case of a loan for seventy-five years, where the interest is 4.3 per cent, the amount due each year, interest plus annuity, is only 4.48 per cent, and, in this way, the farmer is able to pay back the entire loan without great burden.

The French government supervises the operation of the Credit Foncier, appointing the governor and two subgovernors. The affairs of the company are run by a general assembly, representing all the stockholders of the company. This assembly appoints the council of administration, which, with the three treasurers general, numbers 23 members. The shares of the company are dealt in on the Paris Bourse and may be purchased by anyone. They are issued for 500 francs, paying 6 per cent dividends. The capital stock of the company is 200,000,000 francs, or about $40,000,000.

In Germany practically the same system prevails in what are known as "Landschaften." These are societies of farmers with the power to issue bonds based on mortgages held by the association. These bonds are guaranteed by every member of the bonds find ready sale in any bank in the Empire and are bought by investors of every class.

The backers of the scheme in Washington feel confident that plenty of American money at cheap rates can be found for investment in American farm-land mortgages if this system is introduced here, and the link is provided for the farmer to get his offer before the general investors of the country. It is intended to make the venture, when adopted here, a project primarily for the benefit of the farmer. The promoters of the scheme are not to receive any portion of the profits, and even the earnings of the stockholders will have to be kept down to very reasonable rates. Government supervision may be introduced as in France, or at society. With this guaranty these least provision would be made for thorough investigation of the operations of the company by the Federal and probably also by the state authorities. It is likely that the cooperation of the state governments will be required in other ways.

Discussing the plan today one of the government officials to whom has been intrusted the preparatory work declared that the failure in the United States to secure cheaper money for the farmer has been largely responsible for the fact that the per acre production of many staple agricultural products in this country is far behind the European production. This is true, he said, in the production of wheat, oats and potatoes, in all of which products Europe leads in acreage production. He pointed out that in Europe when the governments took up the question of teaching the farmer improved methods of agriculture they had the foresight to help him secure the wherewithal to adopt these methods. Much is being done by both the federal government and the states through the Department of Agriculture, the agriculture schools, experiment stations, and in other ways to teach the American farmer better methods, but nothing has been done, he pointed out, to help the farmer secure money with which to adopt them.

The agricultural education work in Europe was done hand in hand with the farmers' co-operative movement, and the governments aided the co-operative associations by granting subventions, lending expert advice, and in other ways, so that the farmer, whenever he was taught a new method or shown the value of introducing improved machinery, was given a way to secure the necessary machinery or adopt the new plan.

As an instance of the benefits extended to the farmer it is pointed out that in France these co-operative societies which have been developed with government aid spend a part of their surplus funds in the purchase of high grade agricultural machinery. This machinery can be obtained by

Imported Horses

AT

Public Sale

Owing to the calling off of the Streator Combination Sale, we have decided to hold a Sale on our farm, located 8 miles east of Streator, Ill., 3 miles north of Blackstone, Ill., on C. & A. R. R., 4 miles southwest of Ransom, Ill., on Santa Fe R. R., on

Tuesday, January 14, 1913

Commencing at 11 o'clock a. m., rain or shine, under a heated tent.

50 HEAD OF

Imported Percheron and Belgian Draft Stallions and Mares Ranging in Age from 1 to 4.

A very choice lot of young stock of size, quality and breeding. The best that could be purchased in France or Belgium. The Belgian mares are bred to our Champion Belgian Stallion Mayor d'Hoorezeke 2056 (24898), and Percheron mares were bred in France to Government Approved Stallions and colts will be registered as Imported in dam. There are several matched teams of different ages among the mares.

This sale will afford an opportunity to purchase good breeding stock at your own prices.

Good mares from weanlings to 4 years old. **Ben Bohlander & Son, El Paso, Woodford County, Ill.**

WHAT DO YOU WANT? Mares, stallions, jacks, saddlers; standard bred stock of all kind. The best is not too good. I WANT Percheron stallion, extra good and an extra good jack. **Isaac C. Lohman, Turney, Clinton Co., Mo. Rte. 3.**

BURRESS BROS.

Breeders of Percheron and Belgian Horses.

We have some good, big boned draft stallions for sale of all ages. Our horses are pasture raised and acclimated.

We showed our horses at Nebraska and South Dakota State Fairs and the Interstate Fair at Sioux City, Ia., 1912, and won eighteen prizes.

We still own, and are breeding, the imported mares that we won first and sweepstakes on at Nebraska State Fair in 1908. We also have some good, big, high grade colts that will make ton horses.

Write us, or come and see our horses before you purchase. Barns in town. Carroll is located on the C., St. P., M. & O. Ry., sixty miles West of Sioux City, Ia., and 120 miles West of Omaha.

Reference—First National Bank, Carroll; Citizens' National Bank of Wayne.

Burress Bros., Carroll, Wayne County, Nebraska.

PERCHERONS AND JACKS

for sale. "Don" 72956; black Percheron; foaled 1909; a sure breeder of fancy colts; easy to handle; broken and used every day in farm work; weighs 1,700 pounds in working order. Price $800.

"Coco" (84587); black Percheron horse colt; foaled 1911. $500. These animals have never been pampered or unduly forced. Both are rich in brilliant blood.

"Dan Taylor, Jr." 3194; jack; black with white points; 15 hands; very large boned; fancy head and ears; sure foal getter of dandy mules; quick worker. $1,000.

Will take registered mares or fillies in trade for any of above stock. We have a surplus of stallions and jacks. **Borden Stock Farm, Tonti, Marion County, Ill.**

REGISTERED DRAFT STALLIONS AND MARES

for sale; mostly Percherons. Also road stallions, mares and colts at prices to suit your pocketbook and full value; can furnish most anything you want. **E. P. Hamilton & Sons, Garden Grove, Decatur County, Iowa. R. F. D. No. 2.** We are 23 miles southwest of Chariton and 24 miles southeast of Osceola. (Station, Leroy).

STALLIONS FOR SALE.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Am offering these stallions because I have adopted the capsule system and have them to spare. **Henry Dreher, Cedar Rapids, Boone County, Neb.**

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

WORTH AN ANSWER.

It is worth a stamp and a moment of your time writing to learn about my registered Percherons now of serviceable age. Home-grown stallions of substance prove the best value. South Central Iowa. Good railroads.

Fred Chandler, Route 7, Charlton, Ia.

IMPORTED STALLIONS. BELGIANS AND PERCHERONS.

Have just arrived from Belgium and France with new importation of Belgian and Percheron stallions which I would like for you to inspect before buying elsewhere. Barn in town. **C. W. Babcock, Walford, Benton County, Ia.** Walford is 4 miles southwest of Fairfax on C. M. & St. P. R. R.

150 STALLIONS.

Home bred draft stallions, $250 to $650. Guarantee to sell you imported stallions for less money than any firm in America. Come to a live stallion market and see all draft breeds. **A. Latimer Wilson, Creston, Iowa.**

the farmer upon the payment of a practically nominal fee and is sometimes loaned gratuitously. Though such a plan is not a part of the present attempt, the reduction of rates of interest on money and the improved terms which it is expected will be obtained for the farmer will make it a much easier thing for him to purchase improved machinery and better his methods of cultivation.

The American organization would probably act in a far more restricted field than most of the European companies, which have many other functions than the sole one of floating bonds on farm mortgages. However, it would provide the essential link between the farmer and the general investor.

SCIENTIFIC BREEDING SCHOOL.

(Continued From Page 5)

is useless to make a service on mares that cannot fertilize. Frequently it is not the loss of that particular service but as a result of breeding a diseased mare numerous other mares are not only made barren but are put in the infectious class of diseased mares. The capsule system is not the only thing taught at this school. Successful natural service is an important feature. A lot of breeders have made a success of the capsule system without attending a school, but many of these same breeders have later found that they could greatly enhance their income by attending this school. Breeders should stop to think how many extra colts it would require to pay the expenses of attending one term of school. After they have attended and practiced some of the up-to-date methods their own judgment will tell them whether it is necessary to attend later terms or not. Every breeder should be glad to know that there is an institution where plain horse men can get this kind of information without being embarrassed, regardless of their present education. Fathers and mothers should appreciate the outstanding character of every instructor in this institution, not only from a scientific standpoint, but for their high moral character, which has had wonderful affect on those who attend this school.

The next term is January 13 to 18. Breeders and farmers have had a great opportunity to get their work done owing to the open weather and we can not see any reason why a large number cannot be present at this term of school. It is up to the breeders to make this school a success. If any breeder attends this school and is not perfectly satisfied in every way his tuition fee will be refunded, and he alone is to be the judge. We believe it is the duty of breeders to come to this school and investigate for themselves. The hundreds of testimonials of successful breeders who have attended this school should be sufficient evidence of its great value. The tuition fee is $25 for a life membership.—Advertisement.

MAKE IT A BUSINESS.

"Horse-breeding as a business, the same as dairying," was advocated by Professor Cumming, principal of the Nova Scotia College, in a recent paper read at Ottawa last month. He pointed out that the successful dairy farmer found out his poor milkers and disposed of them in order to make the utmost profit. He also studied methods of feeding, etc., with the same end in view. The horse-breeder should apply the same business principles. With horses, as with cows, first-class animals are always scarce and dear. This principle should guide the horse-breeder in the selection of breeding stock. It had been estimated that it cost as much as $100 to bring a colt to two years old, from which period he should earn his own living. The better horse he was when he came to maturity, the more profit he brought to his breeder. Taking an ordinary "general-purpose" horse, it was shown that a good draft, road

PETER HOPLEY & SON,

ATLANTIC and LEWIS, IOWA,

Importers of PERCHERONS and SIRES

We have been making from one to three importations a year since 1884 of the best stallions and mares that we could find in France and Great Britain. **We have now the best lot of both breeds** of stallions and mares, nearly all two-year-olds, that we have ever had on our farms at one time. **They excel in weight, bone and quality.** We have two-year-olds weighing in moderate flesh **up to 1,950 lbs.** We have secured a number the get of the most noted sires in France and Great Britain. **We have a number of top show horses.** We want you to come and look them over, and you will agree that what we have said is conservatively stated, and in spite of our selections we are able to quote very moderate prices. Remember, our horses are all kept at the farms between Atlantic and Lewis, on the main line of the Rock Island, 60 miles east of Council Bluffs.

A. A. FIRKINS. J. E. PARK.

PERCHERON STALLIONS AND MAMMOTH JACKS

Our stallions are all blacks and grays; all young; sound and ready for service. Some ton three year olds, as good as grow. All registered in P. S. of A.

Our Mammoth jacks are Kentucky and Missouri bred; all blacks with light points; all two years old and over; all registered and every one has size and quality; all broke to service. We give a liberal guarantee with all stock. Come and see us or write. Barns in town; 50 miles north of Kansas City and 35 miles east of St. Joe on Rock Island and Burlington.

FIRKINS & PARK, CAMERON, MO.

or carriage horse would bring, perhaps, twice as much. This might be taken as a general rule, and should condemn the aim in breeding of the "general purpose" horse. Great improvement in results, it was shown, had been secured at the Nova Scotia College farm by breeding half the mares to produce autumn foals. The gain from this had been found to be two-fold. In the first place, the farm work could be carried on by the mares without much loss of time from breeding; while it was also found that a September foal at eighteen months old was on about equal terms with his spring-foaled brother, six months older. The autumn foal went to pasture the following spring fit to make rapid growth, and it was at this period that he overtook the older colt. Practically, the autumn foal commenced to earn his keep at eighteen months instead of at two years old. From this experience it was advised that wherever a few mares were kept, some at least should be bred for autumn foals.

DIARRHEA IN ANIMALS.

To the American Breeder: Diarrhea is caused by some disturbance in the bowels. In some animals it may be produced by some specific germ, as "white diarrhea" in chickens, or cholera in hogs. In young calves or colts the milk of the mother usually induces it and very often proves serious. In older horses, fermented or soured feed, inactivity of the liver, worms, foul water, overheating or exposure to cold, may cause the trouble. In cattle, bloating excessive green feed or moldy silage may be the causative. The watery discharge from the bowels may be accompanied by cramps and other colicky symptoms, and in young colts and calves death often ensues.

Treatment consists in treating the cause of the diarrhea for it is only a symptom. Each case should be given individual treatment and no specific drugs can be mentioned for all cases.

In young colts, the mother should not be overheated or overworked. Foals should not be kept away from their mothers for more than four or five hours at a time. Often by milking out the mare completely, and giving the colt three or four eggs beaten up in two tablespoonfuls of whisky and giving boiled water to drink, following with a tablespoonful of castor oil, the trouble may be relieved. If the diarrhea is caused by worms, poisons, etc., of course these must be treated accordingly. Other young animals can be given the same treatment, giving about one-tenth the above dosage for smaller animals.

For calves, raw linseed oil is good with half teaspoonful of ginger.

In chickens thoroughly disinfect runs and coops with carbolic acid in whitewash.

Probably no other class of disease causes as much loss among young animals as do bowel diseases and it is a good policy to consult a competent veterinarian at the outset, for the correct treatment at the beginning will often save the animal's life.—E. T. Baker, Veterinarian, Idaho Experiment Station.

BURN OR BURY THE CARCASS.

Every dead animal should be burned or buried, whether it died from disease or by accident. Buzzards are very plentiful and it is a well known fact that they are liable to visit all kinds of carcasses. A buzzard that dines on the carcass of an animal which has died from hog cholera, black leg or any of many other well known diseases, frequently also partakes of another carcass on a farm which is not infected. The buzzard is thus a carrier of infectious germs into uninfected territory. The buzzard can cover a very great distance in a short space of time and infect widely separated localities.

This method of conveying disease is not studied closely enough. Frequently the buzzard takes germs away with him and at that same visit leaves another variety, which may be scattered about the farm or that vicinity.

Most states have laws requiring all animals to be buried. Every animal dying with an infectious disease should be buried. Hog cholera has been very prevalent during the last two years and the spread of this disease will not be stopped unitl the breeders and farmers understand more about the method of conveying this disease. A strict quarantine is the only method of saving the stock. If the germs do not come in contact with the stock the stock will not die from infectious disease.

THE ARABIAN METHOD OF HORSE TRAINING.

To the American Breeder: Having passed my 77th year I have given the care of all animals over to my son, who will care for me through my declining years. But there is one point upon which my long experience may aid in animal breeding.

We learned the Arabian art of training horses 65 years ago. I have had time to see that each generation becomes easier to learn our language, and find a horse is much safer and easier managed if he knows what you say to him. There is a horse on the farm that I have worked 26 years, and he has always done promptly what I requested him to do, and I have never known him to be struck with a whip. Supposing that you understand the Arabian art, I will not give it, but if it is not known to you then I will give it in full, so far as my memory serves. Our printed instructions were burned in my brother's house. For 30 years I kept a trained team to aid in raising barns, bridges and other heavy work with ropes and pulleys. I worked on the farm until I was 30, then returned to farm work when I was 60 years old.

A well trained horse is a great pleasure to me. If in the pasture, they will come when their name is called. If necessary they will lie down to receive what I wish to put on them, and get up with the greatest care if it is a sick or crippled person they are to carry. We boarded a man for four months, and he went thirteen miles to the doctor twice a week to have his foot restored that had been split with an ax and the nerves injured so it was so tender and painful that he could not bear for it to hang down. So we would have the horse lie down by the porch and he would get on its back with a pillow on the horse's neck and his sore foot on the pillow, and no man ever lifted a sick man with more care or carried him more gently.

The training should fill all demands on the farm. If you have never seen a stallion that was properly trained you may doubt their obeying their master willingly. But I know that I have trained them so completely that they would approach a mare gently. You must get them to know that you are their friendly master. A man should always be in a pleasant humor and use the kindest words so that he will not cause undue excitement.

The mustang (the Mexican pony) is hard to teach by any means that I have tried. The Shetland and Indian pony are quick to learn. Some men are as hard to keep in a good humor as a mustang. Such men will be greatly benefited if they try to learn the Arabian art of training horses, and practice what they teach.

ISAAC M. NEFF,
Harrison County, Mo.

AMERICAN BREEDER BOYS' CLUB

COLT EXHIBITION

Class for Boys 9 to 13 Years.

1st Prize—Marion Merkle, Iroquois Co., Ills.
2nd Prize—Chas. H. Ross, Greene Co., Ills.

To the American Breeder:—I am sending you a photograph of my colt. Her name is Bessie; her color is bay; was foaled June 6, 1912. Her mother's name is "Fil" and she weighs 1,700 pounds. She is sired by Victor 75470, Percheron Society of America; he is three years old and weighs 1,850.

Bessie was sick when she was about two weeks old for three weeks and did not grow any, so she is not quite as good as she ought to be, but I think she is all right. I feed her oats and oil meal twice a day and she runs in the pasture all the time. She is broke to lead good and is very gentle and quiet.—Chas. H. Ross, Greene County, Illinois.

Who Has Hulled Soy Beans?

To the American Breeder:—I enclose check for $2.00 for three years subscription. Please send me your advertising rates. I would like to ask your readers through your paper if any of them have had any experience in hulling soy beans with a regular wheat thresher, if so, what changes they made.—Joseph E. Siegel, Miami County, Ohio.

WHAT BRED OF POULTRY.

(Continued From Page 11)

as well as those who contemplate making a change, to investigate and find out from observing your neighbors' methods, visiting poultry plants and see for yourself what you think would suit you best, and the main thing is to find out how to care for them. I believe there is more neglect to poultry on the average farm than any other kind of live stock. There is more money in poultry, more clear profit, for the amount of money invested, per head, than any other class of live stock. If the farmers' wives could and would invest at least one-half of the money made on their poultry for a short period in more comfortable buildings they could greatly increase their profits and save so much time and labor in caring for same.

Now, just one word to those contemplating buying stock or eggs: Select your breed, then select the party from whom you expect to buy with equally as much care, as there is as much difference in the strain as there is in the variety—some breeders putting in more time to produce larger, stronger, more vigorous specimens, with excellent laying qualities and ancestors of same quality, rather than quantity. The first named will cost you more money to begin with but will be much cheaper in the end.—Mrs. James A. Staples, Pettis county, Missouri.

YOUR CHOICE OF IMPORTED PERCHERON AND BELGIAN FORD STOCK FARM stallions at $100 profit. Absolutely first cost revealed in plain figures; the best money can buy. Positive guarantee with every purchase. Correspondence, inspection and personal acquaintance solicited. Investigate. **Ford & Harrington, Parker, South Dakota.**

IMPORTED PERCHERON STALLION

Black; weight 1,800; 11 years old; sound. Have used him three years. Price $700 if taken this month, or will trade for mares or fillies. **Frank Brent, Smithshire, Warren County, Ill.**

FIVE PERCHERON STALLIONS.

From two to six years; very good. Stock all registered. Have to sell to change blood. The oldest one a ton horse. Most are black. **D. Teinert, York, York County, Neb. R. F. D. 4.**

Registered Percheron Stallion

For sale; two years old; steel gray; weight 1700. Also one registered Spanish jack; 16 1-4 hands; weight 1200, and one Mammoth jack, ten years old, 15 hands. Reason for selling, too much stock. **H. C. Broadstreet, Cloverdale, Putnam County, Indiana.**

TWO GOOD PERCHERON STALLIONS

For sale or trade; three and four years old. Will trade for good, big jack or good, big standard bred stallion. Also some good, big jennets bred to Jack; 16 hands high with as much bone as I ever saw on a Jack, and a good one. Also good black Jack, coming yearling. **A. M. Perkins, Washington, Davies County, Ind.**

A High Grade Percheron Stallion

For sale or trade for young live stock. A good horse to buy and turn out on the range. He is a beautiful seal brown; has fine disposition; will work in any harness; eight years old; weighs 1800. A very sure breeder and a good sire; have colts to show. Is sound and right in every way. For particulars write. **D. L. Steefe, Sedgwick, Harvey County, Kas. R. F. D. 4.**

Registered Percheron Stallion

For sale, if taken before the first of March, 1913. Two years old; weight 1700 pounds; color, black; star; has good disposition and is well broke to work. This colt is of the low down, wide out type. You seldom find as much bone and quality in the same horse. He is extra well bred. His dam is an imported mare; can show you his sire and other pure bred colts by his sire. If you want a stallion to head a herd of pure bred mares, you can't do better than to come and look at this colt. He was bred to a few mares last season and about 80 per cent are showing with foal. For particulars, write **F. H. Taylor, Sedgwick, Harvey County, Kas., R. F. D. 4, Box 38.**

12 Percheron Grade Brood Mares

From 3 to 7 years old; weighing from 1300 to 1700; nine in foal by one of the best jacks in the state.

Also 20 young mules.

Hirsch Bros., Mokena, Will County, Ill

PERCHERON STALLIONS

For sale. One registered black stallion; three years; blocky build with big, clean bone; one two-year-old imported blue roan stallion.

Also a few mares. All registered in the Percheron Society of America. **Paul Hangartner, Roanoke, Woodford County, Illinois.**

PERCHERON STALLION

For sale. Registered; black; three years old; sound, with good bone and feet; lots of quality and action. A genuine show horse. A sure breeder and easy to handle. Price $1,000; no less; no trades. **Ralph Thurston, Osceola, Clarke County, Iowa.**

PERCHERON STUD COLTS

For sale or will trade for good jack. One is coming two in March, 16 hands, over 1400 pounds; one coming one in March, just as good; full brothers, both blacks, the older recorded. **Gus Aaron, Leavenworth, Kas.**

BELGIAN STALLIONS.

for sale. Two Belgian stallions coming two and three years old. Both state fair winners. Write for photo and further description to **C. W. McDermott, Wiota, Cass County, Iowa.**

FOR SALE OR TRADE FOR LAND.

10 stallions; 1 black imported Percheron; 13 years; weight 1800; 1 black imported Percheron; 5 years; weight 1800; 1 brown home-bred Percheron; 4 years; weight 1800; 1 black imported Coach; weight 1400; 1 bay Hambletonian; 6 years; weight 1100; 1 bay Hambletonian; 7 years; weight 1200. All registered.

1 large Mammoth black jack, 8 years; 1 large Mammoth blue jack, 8 years. All sure breeders. Colts to show. **Eli Smith, Cushing, Payne County, Okla.**

Two Percheron Stallions

One black imported stallion, Gageron; 16.3 hands high; 1800 pounds; in moderate flesh; colts to show.

We also have for sale young jacks and trotting bred stallions. Only 22 miles from Kansas City; 28 steam and electric trains each way daily. Write or phone me if possible before coming. **F. M. Lorimer, Olathe, Kansas.**

REGISTERED FRENCH COACH STALLION

For sale; Uzel Jr. (4174); foaled 1905; deighs 1360 in breeding condition; coal black; sure breeder; easy to handle; quick breeder; took first and sweepstakes at Iowa State Fair as 3-year-old; sound; well broke to all kinds of harness; colts to show. A show horse in all respects; fast walker and fine action. Registered in Iowa and Minnesota. Must be seen to be appreciated. Priced right for cash. Am closing out the business. **Ernst Klein, Lake Park, Becker County, Minn., R. 1.**

IMPORTERS OF PERCHERON HORSES

and dealers in American bred draft horses and standard bred horses and high class jacks. Will sell at right kind of prices and terms to suit purchaser. Give us a look before buying elsewhere.

Fisher & Walker, Evansville, Vanderburg County, Indiana.

STALLIONS, MARES AND A JACK.

One six-year-old and two two-year-old stallions, registered in Percheron Society of America. These horses are built right. You will be pleased with them. Want to sell one; take your choice. Also four brood mares and one weanling filly, registered as above. Want to sell two, take your choice. Have bred Percherons for six years. Also one black jack with light points; 5 years old. Will price him right for cash, or will trade him for other property. Write for particulars. **H. M. Stephens, Munden, Republic County, Kansas.**

March 10—G. C. Roan, La Plata, Mo.

For a long time past the American Self-lifting Steel Gate has been used and endorsed by the leading railroads, the U. S. Government and farmers, breeders and ranchmen in all parts of the country. In fact so successful has it been in every way that the makers—the American Farm Gate Co., 1457 Elmwood Ave., Kansas City, Mo., are now installing it on a positive Three Year Guarantee—agreeing to return the purchase money at the expiration of that period if after the severest possible tests the gate is not satisfactory. The company issues an interesting book on gates which is sent free to anyone writing them for it.

Geo. W. Souers & Sons of Huntington, Ind., write: "We are enjoying good trade this season. Our horses arrived October 10 and are now in the pink of condition. We are making very attractive prices on stallions at this time. Some of our recent sales are as follows: A fine young 2-year-old Belgian stallion to Messrs. Gandy & Son of Albion, Ind.; a 3-year-old Percheron stallion to Garrett Bramsch of Woodville, Ohio; Percheron and Belgian stallion to John Oesch of Topeka, Ind.; a Percheron stallion to Yost Y. Miller of Goshen, Ind.; three fine young Belgian mares to Messrs. Britt & Son of Turner, Mich.; a fine young Percheron stallion to John Orr of Patriot, Ind.; a 2-year-old Percheron stallion to Messrs. Roberts & Kinzer Bros. of Carmel, Ind.; a fine 3-year-old roan Belgian stallion to Wm. Bleke, Huntertown, Ind.; a fine team of Belgian mares to Lewis Wren of Goblesville, Ind.; a fine Belgian mare to Levi Heaston of Markle, Ind.; a fine Percheron stallion to Messrs. King & Son of Ossian, Ind.; a Percheron mare to W. E. Smiley of Payne, Ohio; a fine 2-year-old Percheron stallion to J. S. Miller of Wooster, Ohio, and a fine young chestnut Belgian stallion to Harrison Manis of Elwood, Ind."

Anyone wanting a good, practical stock man of seven years' experience with breeding stock should look up the advertisement in this issue of T. J. Cunningham, Cartmell, Mo., and communicate with him for further particulars.

Among the large consignees to the big breeders' sale of horses at Bloomington, Ill., are the following: Ben Bohlander & Son, ten imported Percherons, stallions and mares; James Loonan & Son, eleven head of imported and home bred Percherons; D. Augstin & Sons, Percherons; William Ritchardson, seven Percherons; W. C. Baughman, eight Percherons; John Wilt, eight Percherons and Belgians; D. S. Forrest & Son, eight Percherons; W. H. Ritter, imported Percherons and Belgians; A. V. Hodgson, Percherons; J. H. Weaver, Percherons; Woulf Bros., ten imported Percherons and Belgians; Turnipseed & Stewart, Percherons, stallions and mares; Lonzo McClain & Sons of Ohio, ten imported Percherons; Leigh Bros., Percherons; Ed Miller, Percherons; W. W. Down, imported Percherons and Belgians; J. R. Prendergrast, Percherons; Alfred Phillips, imported Percherons, and sixty other consignors of Percherons.

Taylor & Jones of Williamsville, Ill., write: "A few days ago Prof. Edmonds of the University of Illinois paid us a visit with a view of purchasing something for use in his college. He has been looking for something for this purpose for some time and we are glad to say he selected a very fine specimen of the Percheron breed. We congratulate the college on being able to have such an animal there. We also sold to our long-time customer, C. G. Decker, of Champaign County, a very high class imported Percheron stallion to help his other horse with the business Mr. Decker has built up in his section. We have been selling Mr. Decker his stallions for several years. We predict for this horse a big season's business, for he is the type that people in that section will admire. We have many more of the same type and will appreciate a visit from prospective buyers of any of the draft breeds."

W. A. Lane and Co., of Greeley, Ia., write: "We have recently landed a large importation of the very best Belgian and Percheron stallions, and a few mares. These horses are all the big, heavy boned kind, and are all sound and right. They had a long, hard voyage, and are thin in flesh, but are all in good health. A buyer can make no mistake in buying any one of these horses, as they are all good ones, and our Mr. Lang is to be congratulated on his especially fine selection. We have always looked after good, clean, heavy bone, but he has been especially fortunate this year in obtaining it. These colts will improve the standards in any community that may be fortunate enough to get one of them. To accommodate our ever increasing trade, we will be compelled to import again in the near future,

IMPORTED STALLIONS

PERCHERON SHIRE BELGIAN

Each year we show our New Importation the same month they land; each year they win more than all other exhibitors combined. At the American Royal this year we won 2nd on 4-year-old Percheron, 1st, 3rd and 4th on 3-year-old; 1st and 3rd on 2-year-old and 1st and champion on group of five stallions. All are for sale. Our guarantee and insurance are the best. Our horses the best.

and as usual the next importation will be fully up to the standard of this one. We are selling very rapidly, and our old customers are returning to us as they always have in the past for more horses when they need them. We hope to see many American Breeder readers here this winter, and we will assure them of the best of treatment, and will sell them horses well worth the money in every instance. We do not cater to parties wanting merely a cheap horse, but we handle the horses that will suit the most discriminating buyers. Neither will we sell below cost in Europe, but we will give as good value as can be obtained in this country from any legitimate importer, quality considered. We handle none but imported horses, and of the best of them, and parties that want a No. 1 good horse will do well to come here, and he will be able to obtain it. All pedigrees stamped and approved by the government. We will be pleased to have any of your readers come here and inspect this stock, whether they buy or not. We extend credit to responsible buyers who desire it, and they can buy as cheap for good note as for cash."

Trumans' Pioneer Stud Farm, Bushnell, Ill., writes: "We have sold our International (Olympia) champion Percheron stallion Intitule to Samuel Insull, Esq., president of the Commonwealth Edison Company, to place at the head of his stud of Percherons at Hawthorne Farm, Libertyville, Ill. Intitule was considered second in the aged class at the last International and was considered by good judges one of the grandest specimens of the breed ever imported to this country. The price paid for this horse was $10,000. We also sold our grand champion Percheron mare at the International to Thomas G. Plant, Esq., of New York. We have also sold to A. O. Crooks of O'Brien County, Ia., an outstanding two-year-old Shire stallion, winner of first prize at the Bushnell Horse Show. We feel greatly interested in this sale for the reason that this is the third Shire horse that we have sold Mr. Crooks without his seeing either one of them and in each instance he has been highly pleased. Those enterprising breeders, Messrs. Schwake Bros., Goodhue County, Minnesota, we sold an imported Hackney stallion and a black Percheron stallion. To Orlin Kirk, Crawford County, Illinois, an imported Shire stallion and a pair of imported Shire mares. The Money Creek Horse Company of Houston County, Minnesota, selected an imported gray Percheron stallion. This is the second stallion we have sold this company. Our old customer, S. J. Huston of Louisa County, Iowa, purchased a pair of imported Percheron mares. To John H. Duis, Dawson County, Nebraska, we sold three imported Shire stallions. Mr. Duis has one of the best breeding barns in the state of Nebraska. To our old customer, Frank Stoddard, Coles County, Illinois, we sold an imported Shire stallion. This is the third stallion we have sold him. Dunham Bros. of Louisa County, Iowa, purchased the noted Shire stallion Jester. These gentlemen have a stud of pure bred Shire mares and this is the second Shire stallion we have sold them."

Alfalfa and grain farms in Oklahoma, close to good market, are advertised in this issue by Lawton Land & Loan Co., Lawton, Okla. Also big Texas stock ranches.

Special values in imported Percheron and Belgian mares, bred to great stallions, are features in the public sale of Thos. and James Woulf, Streator, Ill. The sale (which also includes a fine lot of stallions) will be held at the barns of Messrs Woulf, Tuesday, January 14. Write for catalog and attend.

The presence of a big importing and breeding business like that of North & Robinson, Grand Island, Neb., is one of the most favorable factors for the improvement of draft horses in that state. Stallion men, stock men and farmers find that they get best results from seasoned and acclimated breeding stock, and North & Robinson furnish one of the best and most convenient sources of supply for this kind. For further information about the big assortment of stallions kept on hand, see the advertisement in this issue.

Lamer of Salina, Kas., has won for himself a big place in the draft horse business of America. Although one of the furthest west of the big importers he does business on a big scale, bringing in horses in train loads and selling them out at a rate rapid enough to justify his big investments. Wherever there is any business of importance in draft horse stock, the name of Lamer is well known and his important business announcements, like that appearing in his advertisement in this issue, are looked for.

The first big jack sale of the season is that of A. E. Limerick & Son and W. E. Bradford at Columbia, Mo., the date being February 6. Their offering consists of forty head—twenty-five jacks old enough for service and fifteen jennets, all registered stock. This is a closing out sale and every animal will be sold; nothing kept in reserve. For a catalogue or other information address either of the above named gentlemen.

Time always tells the tale of who gives the best service in a particular line. Time has shown that R. L. Harriman of Bunceton, Mo., is the premier auctioneer for public sales of high class horses (either draft stock or harness horses) and of jacks and jennets. The fact is he has had more to do with the wonderful development of the public sale business in jacks and jennets than any other auctioneer, and his presence at the head of the list in nearly all the most important sales is evidence enough of this fact. Col. Harriman is a horseman first of all—which may explain why he leads all as a horse auction ring general.

We are publishing on the back cover of this issue more new and interesting information about the wonderful pony subscription campaign being carried on by the national country women's paper known as the "Farmer's Wife," St. Paul, Minn. The easiest way to answer this advertisement and to get full information concerning it, is to fill out the coupon at the bottom of the page, cut it out and mail it to the Farmer's Wife, St. Paul, Minn.—adv.

Bell Bros., Wooster, Ohio, write: "The International first prize two-year-old and reserve champion Belgian stallion Cyclon, winner also at the New York and Michigan state fairs, has been delivered to Henry H. Miller & Son of Huntington, Ind. These gentlemen have for a number of years been buying the best sires they can find, and in their purchase of Cyclon

HOME OF THE GIANTS.

on 14 jacks and jennets from two to eight years old. In this offering will be my herd jack, Klondike; he is a good one; would not offer him only I must change jacks; have some of his colts old enough to breed. **Geo. T. Poage, Garrison, Christian County, Mo.**

JACK FOR SALE.

Stands 15.3; weight 1100 pounds; 7 years old; large bone; good performer. Sure; warranted sound and right. **A. Calender, New Lyme Station, Ashtabula County, Ohio.**

they got one of the best Belgian stallions owned in this country. "Rubis de Bachte," a beautiful bay four-year-old Belgian, winner at the Ohio and Michigan state fairs, and champion at Syracuse, has been delivered to the Ash Horse Company of Weston, Ohio. These gentlemen, the oldest stallion owners in northwestern Ohio, are to be congratulated on having bought such a splendid animal. Seldom is found a better made horse. Correspondence with intending purchasers is solicited and our catalogue will be sent upon request."

If you are in the market for a Percheron stallion or Spanish jack, look up the ad of H. C. Broadstreet, Cloverdale, Ind., and then write him.

J. N. Jaggers of Walnut Ridge, Ark., is advertising improved and unimproved farms in Arkansas. Read the ad in this issue.

Five Percheron stallions are advertised for sale in this issue by D. Teinert, York, Neb. This is all registered stock, and must be sold as I am compelled to change blood.

If you are in the market for a good Percheron stallion it would undoubtedly pay you to investigate what A. M. Perkins of Washington, Ind., is advertising.

If you are looking around for a good man to handle your stock, don't fail to read the ad in this issue of G. L. Deer, New Market, Mo., and then write him for full particulars.

Paul Hangartner of Roanoke, Ill., is advertising Percheron stallions and mares in this issue. Don't miss looking up the ad if interested.

Ralph Thurston of Osceola, Ia., is advertising a good Percheron stallion for sale in this issue. Read the ad.

If you are in the market for a good Percheron stallion, don't fail to read the ad of F. D. Taylor, Sedgwick, Kas., in this issue.

If you have some good mares that you would like to exchange for a registered German Coach stallion, write to P. Blauksma, Bruce, S. D. See the ad in this issue.

Gus Aaron of Leavenworth, Kas., has some Percheron stud colts for sale or trade for good jack. It might pay you to investigate this.

Anyone in the market for chickens should read the ad in this issue of C. W. Fansler, Prairie View, Kas., and then write for further information.

Hirsch Bros. of Mokena, Ill., are advertising twelve Percheron grade brood mares for sale in this issue, also twenty young mares. If interested, read the ad.

Two registered stallions and one registered jack are offered for sale by Wilder Carpenter, Marmaduke, Ark. Mr. Carpenter is offering this stock very cheap as he has not time to care for them.

Some extra good stock in the way of stallions and jacks is offered for sale in this issue by F. M. Branstetter, Gazette, Mo. Read the ad; it gives a pretty good description of what he has.

If you have some registered Coach stallions and mares that you would like to exchange for 80 acres of good land, look up the ad in this issue of C. D. Turner, Doniphan, Mo.

Tyson Bros. of McAllaster, Kas., still have a few choice boars and gilts that they wish to dispose of, and will sell them cheap in order to close out quick. Read the ad.

Don't fail to read the ad in this issue of W. E. McKee of Braddyville, Ia. He is advertising a good proposition in the way of a farm for sale or trade for stock.

Anyone in need of a good man to handle stock should correspond with W. J. Beutler, Chelsea, Mich. His ad appears in this issue.

Oscar Edwards & Son of De Sota, Mo., start their ad in this issue. Don't fail to look it up. They guarantee all stock to be as represented.

When it comes to a good, all-round remedy for horses, "Spohn's" comes mighty near being in a class by itself. On this point Alonzo McDonald writes: "In Spohn's Cure I find greater results in handling catarrhal or contagious diseases in my stable than all other means I have used." See the ad in this issue.

Parties who would like to contribute one or more registered horses or jacks stock to a public sale of such animals, might write Thos. E. Deem, sales manager, Cameron, Mo., who is arranging for such a sale to be held at Cameron, February 27.

White to A. J. Johnston, Springfield, Mo., for full information about the 8080 acre stock ranch he is offering at half price. His ad is in this issue.

Peter Hopely & Son, the well known importers and breeders of Percherons, Belgians, Shires and Suffolk horses, of Atlantic and Lewis, Ia., start their advertising in this issue. Mr. Hopley states that they have had a good trade since returning home from the International, and that their horses are doing fine. They are pricing a fine lot of Percheron and Shire mares from two to four years old that should attract the attention of buyers everywhere.

A more general use of sheet metal in the construction of farm buildings has just been recommended by the Agricultural Department in Washington. It is pointed out that buildings so constructed are ideal not only for the sheltering of farm animals and crops, but can be erected readily at small cost for housing farm implements, thus preventing the destruction and waste which will go a long way in defraying the cost of farming by modern machinery. The Edwards Manufacturing Company of Cincinnati, Ohio, claim that perhaps the most generally used material of this kind is the Edwards "Reo."

Bradley Bros., the well known breeders of jacks and jennets at Warrensburg,, Mo., start their ad in this issue. If you are in the market for stock of this kind, don't fail to look up their ad and write them.

Ford & Harrington of Parker, S. D., ask our readers to investigate the stock they have for sale. They give a positive guarantee with every purchase and their stock is the best money can buy.

Buff Orpington cockerels are advertised for sale in this issue by L. H. Morse, 485 Kansas City Road, Olathe, Kas. If you are in the market, don't fail to read the ad, and then write.

Fred Chandler of Chariton, Ia., has some splendid Percheron stallions that he is offering worth the money. Read his ad.

A good Percheron stallion is offered in this issue by Frank Brent of Smithshire, Ill., at a bargain price, or he will trade for mares or fillies. If you are interested don't fail to investigate this.

A 480 stock or dairy ranch is advertised for sale in this issue by the owner, Frank M. Read, Rapid City, S. D., at $35 per acre. This looks like a splendid proposition and should be investigated.

Junkens & O'Neil of Danville, Ill., have a fine lot of Percheron, Belgian and Shire stallions and mares that they are advertising at good prices. They guarantee a square deal to everybody. Their ad starts in this issue.

Geo. W. Souers & Sons of Huntington, Ind., have a new ad in this issue. Don't fail to read it. They give you many reasons why you should buy their stock. They guarantee satisfaction.

A high grade Percheron stallion is offered for sale or trade for young live stock by D. L. Steele, Sedgwick, Kas. See the ad in this issue and then write him for particulars.

Let Absorbine make money for you. It will reduce swellings, and soft bunches, stop lameness and inflammation, allay pain; heals cuts, bruises, lacerations, boot chafes, saddle galls, etc., without blistering or removing the hair and horse can be used. $2 per bottle at all druggists or delivered. W. F. Young, P.D.F., 388 Temple street, Springfield Mass.

A. Calender of New Lyme Station, Ohio, is advertising a good jack for sale in this issue. Look up the ad and write him if in the market.

Jos. L. Racey of Arabela, Mo., has some good Barred Rock chickens, Indian Runner ducks and drakes and Embden geese that he is offering for sale. Write him for particulars. His ad is in this issue.

To save money and get a better product in kerosene, gasoline, machine oil, axle grease and Processed Oil, the best thing for killing lice and curing mange, get the prices of C. A. Stannard, Box A, Emporia, Kas. You'll find them in his ad in this issue.

The best thing made in a two-horse road grader is made and sold by D. B. Gunn, Red Oak, Iowa.

Lew W. Cochran of Crawfordsville, Ind., writes: "At this time I have the finest lot of Percheron, Belgian and Shire stallions in my barns that I have ever owned at one time in both imported and American bred. I am selling all of my stallions direct from my barns and putting my prices at rock bottom. I have had three importations in the last few months and others to follow in a few weeks. Owing to quality, prices and terms on which I am selling my stallions, they are going very fast. I am making a specialty of selling in car lots to parties in other states and Canada, who take them out to resell in the stock company plan."

See the ad in this issue of W. F. Richardson, Kismet, Kas. He undoubtedly has a good proposition for somebody.

For the best, strongest, most convenient and most durable farm gate made, address American Farm Gate Company, 1457 Elmwood avenue, Kansas City, Mo. They make a special gate for stallions, bulls or other breeding stock.

ARABIAN STALLION.

Three-fourths Arabian; one-fourth Standard. Strawberry roan, with flaxen mane and tail; weighs 1200 pounds; 15½ hands high; plenty of style and quality and some to spare; coming 10 years old; plenty of colts to show, including prize winners. I sacrifice this stallion as I'm quitting the business. No trade. The first draft for $300 gets him. **H. Heckmann, Jerico Springs, Mo.**

PONIES, COACHERS, SADDLERS, MORGANS, ETC.

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. **W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.**

FOR SALE OR TRADE.

Five registered Kentucky saddle stallions, two beautiful mares, five black Mammoth jacks. Cheap for cash or on terms. **Kentucky Sales Stables, Fort Smith, Ark.**

GERMAN COACH STALLION.

What have you got to trade me for a fine German Coach stallion; registered; 5 years old; sure foal getter; fine action. Prefer mares. **P. Blauksma, Bruce, Brookings County, S. D.**

Two Registered Stallions, One Registered Jack for sale. A bargain for you. This stock is sound and sure. Will sell regardless of their worth as I must give my time to my hogs. **Wilder Carpenter, Grandview Breeding Farm, Marmaduke, Ark.**

REGISTERED MORGAN HORSES.

My Morgans are large; 15 to 16 16 hands and 1,050 to 1,300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted. Weanlings to 3 years old for sale by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. **Richard Sellman, Rochelle, McCulloch County, Texas.**

SADDLERS FOR SALE.

We have on hand the greatest collection of saddle stallions of any one firm in the world. Fifteen head of the famous Rex McDonald breeding—the greatest producer of the saddle family. Mail orders will receive careful and prompt attention. We sell more stallions than any firm in the business. **H. A. Greenwell, Lakenan, Shelby Co., Mo.**

Special Attention to Buying on Orders.

THIS PONY FREE!

WE WILL GIVE YOU OR SOME OTHER BOY OR GIRL THIS PONY, WITH COMPLETE OUTFIT, JUST AS IT LOOKS IN THIS PICTURE.

"DAPPLE"

"Dapple" is a beautiful three-year-old dappled-chestnut Shetland Pony 42 inches high, with Silver Main and Tail. He weighs about 300 pounds and is pretty nearly worth his weight in gold. Of the 83 Shetland Ponies we have given away to boys and girls we believe "Dapple" is the prettiest. In fact you very seldom can get a pony of this color. You may have seen lots of ponies in Circus Parades, but you never saw one prettier than this pony "Dapple" that we are going to give to you or some other boy or girl. We selected him out of 100 ponies at the famous Heyl Pony Farm, Washington, Ill., and you'd be the happiest child alive if "Dapple" were yours. Hitched up to his nobby pony wagon he will haul you and all your boy and girl friends that can pile in, just about as fast as you want to go. And when you are not riding or driving him he will play with you and you can teach him to come when you whistle, and lots of cute tricks. Didn't you ever notice what good times children have who own ponies and how pretty these cute little fellows look when trotting up the road? Everybody runs to the door and stops to look at a Shetland Pony going by. Can you think of anything you would like to own better than "Dapple?" Read this page through carefully and then send us your name and address at once.

Here's "Dapple"

THE OUTFIT

And best of all we send free with "Dapple" the complete Pony Outfit just as you see it in the picture. Besides the Pony, the Pony Buggy and the Harness shown we send a Saddle and Bridle, which would make you the most complete outfit that money could buy. You could ride horse-back or take all your boy or girl friends driving everywhere. The pony wagon is just the most comfortable riding and easiest pulling we could buy for our purpose. We have given away so many that we know exactly what kind most boys and girls like. The handsome nickel trimmed harness looks just fine on "Dapple" and the riding bridle is imported and the saddle which we also send we had made to order for "Dapple." No child, no matter how rich his parents may be, owns a nobbier or more desirable pony and outfit than this one which we shall send free and all freight and express charges paid. This is surely the best chance you ever had to get a Shetland Pony, so if you haven't any and think you would like to have us give you this one, send your name and address to us right now so it will be sure to get to us quickly.

Send Us Your Name Today

If You Want to Own "Dapple"

As soon as we hear from you we will tell you how to become a contestant for "Dapple." Don't let anybody persuade you that you cannot win this pony because our plan of giving ponies away is different from others. The fact that we have given ponies to 83 boys and girls all over the United States from the State of New York to the State of Washington already is proof that we give them away. We publish The Farmer's Wife and The Farmer. The banker or postmaster in your town knows that we are one of the largest publishing houses in the United States so we can well afford to give ponies to boys and girls to advertise our papers. We never heard of one of these 83 boys and girls until they wrote and told us they wanted a pony which shows how fair and square our pony contests are and that no matter where the winner lives "Dapple" will be sent without any cost to you. You must send your name and address right away.

We Have Given Away 83 Ponies

Here are the Names of 30 of our 83 Lucky Pony Winners

"Roine," Clarence F. Busick, Adams Co., Ind.
"Bob," Twylah Hart, Shelby Co., Ohio.
"Jean," John H. Elrod, Smith Co., Tenn.
"Chum," Bozzie F. Thornton, Mercer Co., W. Va.
"Sport," Fred Hagerman, DuPage Co., Ill.

"Hero," Gund Eckland, Lac qui Parle Co., Minn.
"Spotty," Mildred Etter, Watonwan Co., Minn.

Notice that we print the names and addresses of 30 of the 83 children to whom we have given ponies which we wouldn't dare do if it wasn't true that we gave away real live Shetland Ponies. We haven't room to print the names of our whole 83 Lucky Pony Winners, but will send you their names also just as soon as we hear from you. We will also send you 1000 votes toward winning "Dapple" and if you write promptly we have a surprise for you which will double your chances of winning one of our Shetland Ponies. The first thing our 83 Lucky Winners did was to send us their name and address which you must do if you want us to send you "Dapple."

SEND YOUR NAME TODAY

Our ponies are given away so quickly that you will stand a better chance to get this one if you sit right down and write us a letter or a postal card or send the coupon opposite filled out with your name and address (either way will be all right). The work we require you to do to become a contestant for "Dapple" is something that any boy or girl who could drive a pony can do, and any child who becomes a contestant will win a fine prize, even if he fails to win "Dapple" which is the best prize of all.

CUT OUT AND SIGN THIS COUPON OR COPY ON A POSTAL CARD AND MAIL TODAY

THE FARMER'S WIFE, 565 Webb Bldg., St. Paul, Minn.

Please send me Certificate of Entry, and pictures of "Dapple" and tell me how to take care of Shetland Ponies. I haven't any Shetland Pony and want to own "Dapple."

Name.....R. F. D.....

P. O.....State.....

This Coupon is good for 1000 votes for "Dapple."

EACH CONTESTANT A PRIZE WINNER

All contestants will surely get a prize of their own choosing from a list which we will send them. Besides the Pony Outfit and Twenty-five Grand Prizes we shall offer Gold Watches, Base Ball Outfits, Gold Bracelets, Fountain Pens, Hand Bags, Flash Lights, Rifles, Shot Guns and dozens of other desirable prizes. If you become an enrolled contestant in this Pony Contest you can't lose. But don't let anyone persuade you that you can't win "Dapple" because you have the same chance as any other child.

Be sure to address postcard or envelope **THE FARMER'S WIFE** 565 WEBB BUILDING, ST. PAUL, MINNESOTA

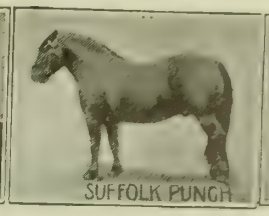
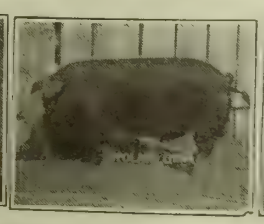
THE AMERICAN BREEDER

A Journal of Live Stock Improvement and Modern Breeding Practices

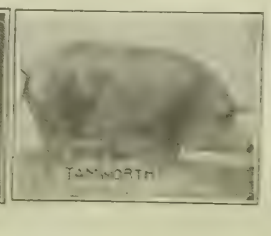
Subscription Price; $1.00 per year or $2.00 for three years, payable in advance.

Volume VI. *Kansas City, Missouri, January 20, 1913* *Number 1*





How All May Use Improving Blood



With modern methods, the above massive, well developed and highly bred stallion can be mated with 500 mares, and still get a better percentage of foals than was formerly obtained. By such methods hundreds of breeders are successfully doubling the net income from their breeding animals and at the same time guarding against injuring their own stock or spreading serious infection.

STALLIONS and MARES

Percherons and Belgians

In addition to the large number of Prize Winners at the French and Belgian shows this spring in Europe and at the various state fairs in this country this fall, we have a very large lot of good young stallions and mares of extra quality and bone, that we will price very reasonable.

We can show you 150 head of horses of the different breeds, the best lot ever imported to America. Sold with a reliable guarantee.

J. CROUCH & SON, Props. LAFAYETTE, IND.

TRUMANS'

CHAMPION STUD

The world's greatest collection of Shire Stallions and Mares, Percherons and Belgians to suit the most critical buyers; Hackneys of Richest Breeding and Strongest Individuality.

Fifth 1912 Importation of Shire and Percheron and Belgian Stallions arrived Oct. 29. Thirty-four years in the business and not one dissatisfied customer.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us.

Address for illustrated catalogue and other information, mentioning the American Breeder.

Trumans' Pioneer Stud Farm

Bushnell, Illinois

Wolf Bros. Big Boned Imported Percherons and Belgians

We landed September 1st with a great lot of Percheron and Belgian stallions and mares. We showed at the great Nebraska State Fair September 5th and won the following prizes:

Two champions, one reserve champion, eight first prizes, seven seconds, one third and three fourth—twenty-two ribbons in all.

THESE PRIZE WINNERS ARE ALL AT OUR BARNS AND FOR SALE AT VERY REASONABLE PRICES.

If you are figuring on buying a first-class stallion or a pair of imported mares and want to see the best horses, you cannot afford to miss the opportunity to see ours. Special low prices made for the next 60 days. Address, for all information

Wolf Brothers

Albion, Boone County, Nebraska

TAYLOR & JONES

Williamsville, Sangamon Co., Ill.

Our new horses are now in the barns, and we have an extra good lot of Belgians, Percherons and Shires. We invite buyers to call and look them over. We buy the best we can buy, and if there were any better to be found we would handle them. Our guarantee is safe, and we can protect a buyer from loss for the full purchase price. Come and see us. It won't take long or cost much; and we feel sure we can save you some money.

TAYLOR & JONES, Williamsville, Sangamon County, Ill.

PETER HOPLEY & SON,

ATLANTIC and LEWIS, IOWA,

Importers of PERCHERONS and SIRES

We have been making from one to three importations a year since 1884 of the best stallions and mares that we could find in France and Great Britain. **We have now the best lot of both breeds** of stallions and mares, nearly all two-year-olds, that we have ever had on our farms at one time. **They excel in weight, bone and quality.** We have two-year-olds weighing in moderate flesh **up to 1,950 lbs.** We have secured a number the get of the most noted sires in France and Great Britain. **We have a number of top show horses.** We want you to come and look them over, and you will agree that what we have said is conservatively stated, and in spite of our selections we are able to quote very moderate prices. Remember, our horses are all kept at the farms between Atlantic and Lewis, on the main line of the Rock Island, 60 miles east of Council Bluffs.

Imported and Home-Bred

PERCHERONS, BELGIANS AND SHIRES

My new importation of stallions and mares, which I personally selected, arrived last month. This importation, numbering over 40 head, comprises the best lot I ever imported, and with those already in my barns and pastures, makes Paramount Stock Farm one of the best places in America to come for strictly high class stallions and mares. Among them are prize winners and tops that cost a lot of money. Come to the farm, 2 miles north of Hudson, 9 miles southwest of Waterloo, and see them. Address, mentioning the American Breeder,

WM. CROWNOVER, Hudson, Blackhawk County, Ia.

North & Robinson Co.

IMPORTERS AND BREEDERS OF PERCHERON, BELGIAN AND SHIRE STALLIONS AND MARES.

50 head of American bred pasture raised stallions from 2 to 4 years old. The good, rugged, stocky Tiger built fellows, with plenty of bone, weight and quality. 10 head of American bred mares as good as grows at bargain prices.

We always have a good assortment of imported stallions and mares weighing a ton and over. Next importation will arrive February 10.

Every day a bargain day at our barns.

Large horse calendar sent free to horse breeders.

NORTH & ROBINSON CO.

GRAND ISLAND, NEBRASKA.

IMPORTED STALLIONS

PERCHERON

SHIRE BELGIAN

Each year we show our New Importation the same month they land each year they win more than all other exhibitors combined. At the American Royal this year we won 2nd on 4-year-old Percheron, 1st, 3rd and 4th on 3-year-old; 1st and 3rd on 2-year-old and 1st and champion on group five stallions. All are for sale. Our guarantee and insurance are the best. Our horses the best.

Mule Trade and Jack Improvement

What the Mule Market Demands Are Bringing About in the Breeding of Jacks—Breeding Mules for a Type in France—Greater Opportunities in This Country.

In the December 20 issue there appeared on the front page of the American Breeder under a photograph of two mules, the following: "Good mule colts are selling for $125 each at weaning time." The growth of the mule industry in this country is marvelous. About one-fourth of the mares in the United States were bred to jacks this year. The average age of brood mares in the southern half of the United States is about ten years. The leading question at the present time is, where will we get the brood mares in a few years if this is continued? The United States has more mules than can be found in the rest of the world. Every mule produced removes the chance of producing a brood mare."

The statistics on this point, which we have gathered, were gotten by sending out hundreds of letters to stallion and jack owners in the southern half of the United States. We find in this large territory that more mares are being bred to jacks than to stallions. In addition to this, we know that a great many jacks are being used in the Northern States, as well as in the East and West. The replies to these letters over the Southern States also clearly indicate the average age of mares as being ten years or over; in many localities the reports state that there were very few mares under ten years of age. The fact that one-fourth of the mares in the United States were bred to jacks last year should convince horse breeders that the horse production is not increasing rapidly.

The mule growth in this country has developed beyond the expectation of the average breeder. There are more mules owned and produced in the United States than in the balance of the world. The principal thing of interest in this great mule development is the size of the mules. Before the war help was very cheap; a slave and a mule made a team. A light boned, 14-hand mule, with an abundance of action and a high head, was wanted at that time. Mules then were not used to any great extent only in cotton cultivation; many of them were not over 13 hands high. The soil was usually of a light nature and it was not thought best to till very deep. But the demand has greatly increased for larger cotton mules, 14½ to 15 hands, some 15½ hands for single use. But most of the cotton planters who have a smooth surface to farm are using regular cultivators, which require two mules, and many of them are using the double row cultivator, which requires three or four large mules.

There are more cotton mules used in the United States than of all other mules combined, and during the last ten years a wonderful market has developed for the big, rugged slaves. Had it not been for the Boer war a few years ago, which took 50,000 small mules out of our market, the undersized, plainer mules might have been a drug on the market at this time. The demand for large mules has increased nearly as fast as the demand for large horses. The smaller mules find a more ready sale at their value than do the small, plainer horses.

Mules are being exported to nearly all countries where mules are used. They can be raised in this country cheaper than in almost any other section, owing to our great feed supply. As an example of the exportations we refer to Roup & Hoffman's shipment a short time ago to South Africa. These were large, rugged mules. The purchase price (from Cottingham Bros. of this city) was $225 per head. Shiping expenses $60 per head and duty $5 per head, made a total of $290 per mule. Roup & Hoffman have usually purchased their mules in South America, but they state that the mules in that country are not large enough for their use, and that they can buy the large, rugged mules in this country cheaper than elsewhere.

Outside of the cotton mules, the sugar mules are of a trim build from one to one and a half hands taller than the cotton mules, but there is not so large a demand for sugar mules. The sugar sections are not extensive compared with the cotton sections. We would not advise any breeder to breed either for cotton or sugar mules. There will probably be an abundance of cotton mules when a larger and better type of mules is wanted. The small single mule team will be used less, and the demand for big, rugged mules will increase, not only in this country but for exportation purposes. Nearly all of the mules that have been shipped from the United States have been of the large type—large, serviceable animals.

Breeders, as well as bankers, must take care not to base their conclusions on the present day, but look forward ten or twenty years so as to be able to meet the demands at that time.

A Texas reader states that we are mistaken about mule colts selling for $125 at weaning time. If this reader will notice we specified "good" mules. Thousands of good mule colts have been sold during the last few months for $125 at weaning time. There is a difference in mules. Those who expect to produce the small type of mules that are most common, and which sell at $125 to $150 at maturity, cannot realize the same profit that the breeder can who produces mules worth $250 to $300 at serviceable age. Mule breeding has received less thought by the American farmers than any other class of live stock. Mules are purchased at weaning time, as a rule, and are bunched with their manes and tails trimmed so that they all look very much alike. Little thought is given to the kind of a mare or jack that really produces the high priced individual. Hence the average mare owner, and too many jack buyers, come to the conclusion that a jack is a jack.

During the early mule development in this country too much attention was paid to the light boned, fast walking, slim bodied mule. Jacks were in demand then which sired this type. It was only natural that jack breeders at that time were searching for this class of jacks. This has been carried to an extreme. Until this publication began to advocate large jacks, with plenty of body and plenty of bone, the demand was for jacks at least 16 hands standard measure. The constitution of these animals were deficient. If a type of jacks had been selected to use on jennets that weighed 1200 pounds and measured 16 hands standard measure, more progress would have been made. Those jacks, of course, during the early settlement, were not to be found; a few imported jacks may have reached those proportions but they were very scarce indeed. Some of the breeders have held to the idea that more bone and body was needed in the jack stock, consequently a great many good herd headers are to be found.

Still there are too many small, inferior jacks; the little ones have little value. The owners of jennets are largely to blame for this. No small, inferior jack should ever serve a jennet, but every jennet that will produce a good jack when mated with a big jack should be bred for that purpose. Jacks were never scarcer or higher. Undersized jennets can be bred to a good advantage to a stallion with the capsule system. There is no use to produce an animal of any kind that will not net a profit. Most of the little jacks are raised at a loss.

The writer was much impressed with an experiment in France in mule breeding. It was indeed enlightening to see those Frenchmen in the Poitier districts where they wear wooden shoes, making the only authentic mule breeding experiment of its kind in the world. The Poitou jack has been well bred for many generations; the breed produces a large type with much regularity. They are usually blacks, bays and browns. A registry has been established for this stock, and each animal admitted to record is inspected by a committee of three, to see that the animal in question is of the proper type. These jacks are about 14½ hands high standard measure, with very thick, long bodies and extra heavy bone. They usually have a very long coat of hair which does not add to their appearance when viewed by an American. In the same district is found a breed of horses known as the mulasiere. These horses are also registered; they have some hair on their legs but otherwise have some of the Percheron characteristics. These would be termed small draft horses in this country compared with our registered draft stock. The progeny of this cross results in a very large, handsome mule—the biggest and best mules in the world, as a class, if they could be termed class. I have seen in this country individuals better than these mules, but what impressed me is the uniform type from this union. Most of the mules have a heavy coat of hair but not as heavy as that of the sire. The ears and head are not as large as that of our mules, in fact, the ears are comparatively short, which is a characteristic of the Poitou jacks. This experiment proved two things, that draft mares could successfully be used and that it was not necessary that a jack have exceedingly long ears to be a good producer. The Poitou mule sells for more money than any other mule. They are wonderfully strong in the back. Many of them are used on the docks working to a large single cart, as is common in that country. Some of them are shipped to Spain.

During the last quarter of a century many jacks from this district have also been shipped to Spain to use as herd headers. The jacks and mules in the Poitier district are not numerous but there have been enough of them to prove that this method of mating is a success. I was informed by the breeders in that district that they expected to do more mule breeding because they found it profitable

The stand that the writer has taken

More Than From All Other Papers.

To the American Breeder: Please put the contents of the other side of this bill in your paper, one insertion, and send me the bill; tell me what two, three or four will cost. I did well with my ad last January. I sold three Percherons. My ad brought me many replies.

I think your paper is the proper stuff. While I have been in the breeding business since 1882, and try to be up to my job, your paper is the cause of me putting lots I know into practice. I also learned more about breeding out of your paper than from all other books and papers.—A. J. Robnett, Fayette county, Illinois.

Every Copy Worth the Year's Subscription.

To the American Breeder: You will find inclosed a check for $2 for which extend my subscription to the American Breeder for three years. I want to say in regard to your paper that the more I read it the more I think of it. I consider it the most valuable paper I take, and I wouldn't think of doing without it. I consider each copy I get worth the year's subscription and some of the copies are worth many years' subscription to me.—A. J. McLarty, Ramsey county, North Dakota.

in mule breeding has not been popular with some breeders. We can sympathize with the individuals who have spent many years in building a herd of stock to meet only one requirement, viz., that of height. We have never said that a reasonable height is a detriment, but we have said that all beasts of burden should be well proportioned. An extremely long legged jack, without any heart girth, does not have enough weight and constitution. Before a class of animals can be increased in size, there must be a provision for carrying food unless they are fed often. The demand in this country will be for a big jack, and in order to increase the size it will be necessary to make provision for feed carrying animals. There are also some who have sacrificed from their herds some of their very best jennets because they were not black with white points. Jacks are kept only for the production of mules. In the mule markets we find that steel gray mules, everything else being equal, are the best sellers.

If we wished to be popular with the jack breeders, especially, we would not make some statements which have been printed, but nearly every individual who has ever advocated something better has at first made enemies as a result of it. It is not necessary that anyone take our advice; we are simply stating the facts as we see them and these statements are only opinions of human beings.

The place for jack breeders to receive valuable information about their business is on the market where the produce of their stock must finally sell—the mule markets. This is the real test by which the financial value is determined. Occasionally one finds a jack breeder who has been in the business a lifetime, who has not improved his herd or set an example for others, but yet he is not willing to concede anything. Breeders must learn that to be profitable for themselves and their country, improvement is necessary.

The object of this article is not to antagonize but to cause jack breeders, as well as others, to think and investigate. There is a class of mule and jack breeders who claim that it is necessary to raise small mules because the large ones cannot stand the heat. When mules are shipped to the market no questions are asked as to where these mules were produced; they are rated according to the looks of the animal. Those who wish to produce mules to stand warmer climate, may continue to do so, but the market will give them nothing for it.

A little over thirty years ago a few jack breeders organized a jack registry. The requirements had to do with height and color, so that anyone could fill out an application and get an animal registered if it met these requirements. This association has continued with these lenient specifications all this time, and yet it has not been prosperous. Perhaps the most that this record has done was to place a premium on height and color —two things which the mule market does not recognize as being of prime importance. If after all these years only a few animals can show registered ancestors, what is the object of this arrangement? There are only a few living animals registered in it. Any one good mule producing state has more good jacks and jennets within its borders than is registered in the Jack Stock Stud Book.

In 1908 a number of jack breeders visited the mule markets and studied the jack registry system quite thoroughly. They found that extreme height in mules added no value. In fact, a well proportioned 14-hand mule was worth more money than the long legged, 17-hand mule. They also found that the black mules were third in market favor, so that the requirements of the old record association were not of any real value to the jack breeders.

(Continued on page 15).

More on the Carriage Horse

What Should Go Into the Foundation of the Breed the Government is Working On? The Best Use For Good Saddle Blood.

A saddle horse breeder has taken us to task for omitting the American saddle horse blood in our American carriage horse article. He states that the saddle horse is the most handsome horse in the world and could place a finish on the carriage horse better than any other breed. It perhaps never occurred to this breeder that the American saddle horse fills a special and very important class in the horse business of this country. Every saddle horse that is good enough to be called a saddle horse can go on the market and sell as a saddle horse. The demand for good five gaited, or even three gaited saddle horses was never better. We cannot see any reason why any individual should be taken from the American saddle horse ranks to be used in any other line of breeding. There is a distinct demand for every good animal and it is a breed of its own, and particular type of its own. The breeders of five gaited saddle horses have something more to do than to find fault with the American carriage horse. If they will pay strict attention to their own business and develop that particular class of live stock as it should be developed, and encourage their use, much better results can be obtained.

There is a wonderful field for the five gaited saddle horse, not only in the United States, but in many foreign countries. There is no handsomer or more intelligent animal or one that attracts more attention than a good saddle horse that is right in every respect. The great difficulty with saddle horse breeders is that they believe that every one should know just what they own, and what class of stock it is without any publicity. Some of them are offended if the buyers do not come direct to their place and pay them a handsome price without any expense. There are legions of people who are able, willing and ready to buy good saddle horses if they knew where to buy them. Saddle horse breeders must first learn to do a little outside advertising before they can expect that breed of live stock to be as widely popular as some other classes of stock.

A new demand for saddle horses has recently come into existence and that is for stallions to be put on a stud along with other stallions and jacks. A great many breeders are purchasing stallions which have a little more size than the show ring requires, as an individual of this kind can be purchased at a reasonable price and can be used to good advantage in country districts as an all purpose horse. There is another requirement, however, and that is a good disposition. This stallion will be used largely with the expectation of producing a set of animals that will be used by the ladies for riding, driving or an occasional day in the field. A great many farmers would like to have a horse of this kind. The sire of this animal can be used as a business horse and as a teaser. Those who have good regular five gaited saddle horses need not worry about any other outlet if they will only let the people know that they have them for sale.

STANDARD BRED HORSES.

There are more Standard Bred horses in the United States than horses of any other breed. The highest prices have been paid for a few select individuals of this breed of live stock. No other strain of animals have made greater progress in speed, yet there are thousands of these individuals that will never be valuable from a speed producing standpoint. In horse racing of all kinds, some necessarily are defeated, as they cannot all be money winners. We do not wish to discourage the Standard Bred horses, as the development and selection of speed sires has created a quality of wind, bone, hoof and muscle which is unsurpassed in other breeds. Standard Bred trotting horses have more durability in the harness for light road work than any other breed of horses, but they have not been bred for type, because speed, not type or beauty or uniformity, has always been the prime requisite. A comparison shows that a great diversity in conformation among these Standard Bred trotting horses can be found. There are a very large number of handsome individuals that should be segregated in a live stock record, and used as registered stock for foundation stock in carriage horse breeding. But in addition to the requirements now in force some plan should be devised to establish certain conformation. These precautions would provide registration, and neither need be very expensive. After a few generations the breeders of these handsome individuals could say with pride that their animals' ancestors were required to make certain performances before they could be registered.

A carriage horse breeding experiment has been carried on in Colorado for several years. The progeny of the horses in this experiment seem to be satisfactory from a type standpoint. Why not enlarge it and use these government stallions as far as possible, as we understand that a number of them will soon be available. This work should be started soon, otherwise a lot of available material might be lost track of.

We believe that a breed of live stock of this kind could be established with profit, but the question is, "What should enter into its foundation?" We invite suggestions along this line and hope those interested will prepare short articles on this subject for publication.

BRIGHT FOR KANSAS CITY STOCK YARDS.

Many of the men, in a territory covering a half dozen states in which Kansas City is looked upon as the chief market center, believe that the recent changes in the Kansas City stock yards management mark the beginning of this market's greatest growth. For years it has been claimed that much of the enormous influence wielded by the packers' organization was used in favor of the points where the packers controlled the yards. Kansas City was the only big market where the packers did not control. Now that the packers have secured control here as well, a big increase in ousiness is expected.

The new manager, George R. Collett, a man of twenty-five years' experience in his line, and now just at his prime, has shown that he intends to keep this market up to its possibilities. For some time, at least, he will have the assistance of the retiring president, Col. C. F. Morse, especially in connection with incompleted work planned by the former administration.

Two of the most active men on the job from the former management—W. H. Weeks, traffic manager, and E. C. Senter, general yard superintendent—are retained in positions which amount to promotion, and the new management will be from the start as close to the live stock interests as the old management ever was.

Following are the newly elected directors: E. V. R. Thayer of Boston, William A. Gaston of Boston, E. F. Swinney, president of the First National bank of Kansas City; Peter W. Goebel, president of the Commercial National bank of Kansas City, Kas.; P. R. Wornall of Liberty, Mo., G. R. Collett, W. H. Weeks and O. M. Waite of Kansas City.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

HANDLING A JACK—As I am rather a beginner in the jack business, I would like to ask a few questions as to how to feed and care for a jack. Last spring I bought a jack, one of the good kind. He was in bad condition when I bought him, but he gradually improved all through the breeding season and this winter he is getting real fat. I feed him twice a day about three quarts of oats in the morning and four ears of corn and plenty of timothy hay at night. He has an enclosure of twenty by one hundred feet to run in, goes in and out of his stall at will except in real cold weather when I keep him in. Is it best to keep him fat this winter or would it be better to reduce his flesh until nearer spring?—Missouri Subscriber.

REPLY — You are handling your jack nicely except that it is not advisable to let him get too fleshy at this time. It is best to bring him into the season in a good physical condition but so that he will gradually increase in flesh during the breeding season. It would be better to reduce the corn ration a little. Corn is not usually good feed for a jack; his hay should also be limited as jacks and mules masticate and consume much roughness. A little bran fed occasionally will keep the bowels in good condition if necessary, and usually considered good feed for a jack.

IMPREGNATORS—I wish to know whether I can get an impregnator which has a rubber sack to be inserted into the mare and then use a "squirt" to insert the semen into the other mares. Is there a better method than the above? If the semen is inserted into a mare that is not in season will she bear a colt and explain any point for or against such efforts. What are the most successful methods in using the impregnator on a ranch with a large number of mares and only one jack? How many can be bred from one cover of jack? Must the rubber sack remain in the mare while breeding the other mares or removed to warm water?—Colorado Subscriber.

REPLY—All rubber should be eliminated, in artificial breeding. Many jacks and stallions are injured through the use of these rubber sacks. We have known of quite a few jacks that served in breeder's bags for several years and did fairly well, but for some unknown reason these jacks seem to get out of order after a few years and die. A very fine jack died in Missouri a few weeks ago that has done well with breeder's bags. We do not know the cause of this. The successful method in breeding artificially is to use the capsule and an instrument having a soft metallic point that can be bent to the lowest part of the uterus for extracting the semen. There are thousands of men using this method successfully. A dozen mares can easily be bred with one service of a stallion or jack with this method.

FEEDING SHEAF OATS—There is a practice in this country of cutting sheaf oats and feeding it as a part of the grain ration for horses and cattle. The stock eat it all right after it is chopped but, what I want to know is anything to be gained by it? I can see one advantage and that is, that stock have to eat oats slower than if it were threshed. Some say it will save hay, but isn't there enough more feeding value to hay to overbalance the straw? I would like the opinion of the editor and any others who have had experience with it. This is for horses doing regular farm work.—Missouri Subscriber.

REPLY—There is probably some

advantage in cutting sheaf oats and feeding it to work horses, provided it is fed in a large tight feedbox, but we doubt if it is worth the expense for the average individual. If an animal should eat too fast a self feeder can be prepared for less than one dollar which will regulate the eating capacity. All horse owners would probably find it valuable to feed their horses from self feeders. If your sheaf oats have been kept in the dry and the straw is in good condition, it serves very well for a cheap roughness. The relative value of hay and straw depends so much upon the condition and ripeness of the oats, and the kind of hay you have in mind that an abstract comparison cannot safely be made.

CASTRATING COLTS—Do you deem it safe for a man who has castrated calves and pigs and has seen colts castrated, to try using the emasculator himself on colts. The clamps are used here exclusively but as I understand the clamps, I think the emasculator or the ecraseur is much the better.—Missouri Subscriber.

During these high price times we would not advise amateurs to do any castrating. While the novice may save a few dollars occasionally, he is liable to lose more than the few dollars he will save in this work. Our advice is to get some one who is proficient in this work and eliminate this unnecessary loss. The emasculator is the latest and best method of castrating.

A RANK SERVER—I have a jack that is quite a prompt server but when he comes from a mare there is very frequently a large amount of the semen wasted and he leaves the mare as soon as his yard is removed. The jack does not appear to be sure on this account. The throwing off of the jack's discharge is quite frequently just as soon as he extracts his yard. Can anything be done and what is the cause? —Pennsylvania Subscriber.

REPLY—If this is a young jack, the operator should be very careful with him and make the services without a severe bridle. The operator should stand near the side of the jack and hold him on by taking hold of his front leg and quietly talking to him to keep him in that position as long as possible. A little encouragement will usually change the habit of a young jack or stallon. The service should be started before the penis is too erect. The semen should be examined under a microscope, as it is probable that this jack is masturbating.

THREE-YEAR-OLD SERVICES — I have a large Percheron colt, will be 3 years old in May. How often can I serve with him and be on the safe side. He bred six mares last year, but some time elapsed between each service. Five seem to be in foal. — Oklahoma Subscriber.

REPLY—We would not advise more than three mares a week, no two services closer than twenty-four hours. If he is growing rapidly this might be a little more than he could maintain for many weeks.

GERMAN COACH HORSES—What is a German Coach horse? What blood lines are used to establish the breed? Please give me the address of the German Coach Horse Association of America.—Texas Subscriber.

REPLY—A German Coach horse is one that has been bred up through the use of Thoroughbred blood. The size has been increased and much atten-

(Continued on page 8).

HONEST MARE OWNER AT DISADVANTAGE.

To the American Breeder: As you ask the stallion and jack owners to write for your January 20 issue, I am accepting the offer. I am talking for my subject the front page of the January 5 issue, "Encouraging Better Sires." In a great many cases the stallioner waits six months after the colt is born for his fee, as a large number are depending on the coming crop for money, that's all right. But did you ever stop to think if these colts die in that six months they are very seldom ever paid for. When, on the other hand, the man that does business on a cash basis pays for his when the colt is but a few days old. Therefore, some think it pays to wait until after the colt is dead. The stallioner has no clue for his fees at all.

Some states have a law giving a lien on both the mare and the colt. This is no more than fair and I encourage all stallioners to urge their representative to act on this while they are now assembled, and next season give the good sire owners a chance to collect their justly entitled fees, as some of the neighbor states do. Then there is that class that come and go. They will live here this year and maybe ten or twenty miles away next year. You won't see the mares all summer and when fall comes you won't know whether they raised colts or not, only by what they tell you, and believe me I have known cases where they have told their neighbors to tell the stallioner that the mare did not have a colt. Nebraska Subscriber.

AN APPRECIATED APPRECIATION.

Mr. Frank B. Graham, Editor American Breeder: I want to thank you very kindly for the excellent manner in which you helped us out with our horse breeders' meeting. Your talk was a very valuable one and was greatly appreciated by all who were present.

The stallion lien law, similar to the Arkansas law, was adopted and the legislature will be asked to pass the same. Several amendments will be asked for which I think will make the Kansas stallion law more practical, although it looks as though they were going to eliminate the veterinary examination for soundness.

The following officers were elected for the ensuing year:

President, George B. Ross, Sterling; first vice president, B. P. Waggener, Atchison; second vice president, A. L. Smith, Lawrence; third vice president, Charles Jones, Girard; fourth vice president, J. H. Lee, Harveyville; fifth vice president, W. H. Rhodes, Manhattan; sixth vice president, M. A. Smith, Cawker City; seventh vice president, George B. Allen, Meade; eighth vice president, J. C. Robison, Towanda; secretary, C. W. McCampbell, Manhattan; treasurer, N. H. Holdeman, Meade.

C. W. McCAMPBELL.
Secretary Kansas Horse Breeders' Association, Riley County, Kansas.

MARE OWNER EDITIONS.

Two issues of the American Breeder in February and two issues in March will be termed "Mare Owner Editions." We expect to incorporate some new features that will not only be interesting to mare owners, but to all farmers and breeders. It is the intention ,to make these four issues good, big papers, full of live, up-to-date material, and we solicit the patronage and assistance of the owner of every good stallion and jack to send in the names of their mare owner friends whom they wish to help them encourage the use of better sires. If better stock is to be bred the stallion and jack owner must work with his mare owner customers with confidence.

We do not believe that an inferior sire is a benefit to any community or to its owner. An animal which will not produce good colts will cast a reflection upon the recommendation of its owner. Farmers are realizing that inferior stock is usually raised at a loss, while it is the better individual that nets a profit. We make these statements in order that no one shall be deceived. We are not soliciting the co-operation of anyone who stands sires that are not a benefit in live stock production.

The locality must be taken into consideration, however, as an excellent sire in one section of the country might be unsuitable in another. There are localities where an individual might be justified in maintaining an animal that would not be up to his own real standard. We could name several hundred individuals who have paid for subscriptions for their mare owners who have written us that this was the best money they have ever spent.

It must be remembered that this publication prints articles and discusses subjects that are never mentioned in other publications. Mare owners usually appreciate these papers, coming especially when they have more time to read, and giving them what no other paper has. We not only encourage the particular individual whom we can assist in being up to date, but co-operate with him in developing better stock throughout the community. A few good workers in a locality can make a wonderful change.

There are breeders who do not understand how to get business, yet they may own the best individual in the whole country.

This is the last call for the mare owners' editions. It is open to anyone whether a first subscriber or not. Those who are not regular subscribers can include their subscription for four issues, at the regular rate of ten cents for each mare owner, if ordered in clubs of ten or more. Each subscriber will get four issues. At this clubbing rate additional subscriptions will be ten cents each. We notify each one on such clubbing lists who it is has paid his subscription. All subscriptions for the mare owner editions must be received at this office by February 5 so that we may know how many papers to print.

A BREEDERS' PUBLICATION.

During the last year a campaign was made to interest breeders in owning stock in the Graham Publishing Company, which publishes the American Breeder. The stock was sold in small blocks so that it could be scattered out and interest many individuals. We were well pleased with the responses of the campaign. We can now advertise to the world that the American Breeder is owned by breeders. There is no more stock for sale. Of course a lot of good men let a good proposition slip by—as often occurs in such cases.

We can see why a lot of men hesitated in buying stock in this publication, for the per cent of publications of a national character that ever live to be one year old is very small. It requires extraordinary conditions and a vast amount of money to establish a publication like this, and those who do not understand fully what these conditions were are astonished that the growth of this publication should have been so phenomenal from the very start. The circulation has increased by leaps and bounds. We doubt if there is another publication in the country that can boast of such a substantial subscription list or an equal list of breeders who co-operate with us in securing subscriptions. We are quite sure that no other publication enjoys the same spirit of loyalty among its readers as is shown in the letters received at this office from subscribers. If it were not for these influential breeders over the country, who have stood solidly by this publication from the very start, such a strong institution could not have been established in anything like the same time.

FALL BREEDING.

A subscriber writes us that a very fine looking stallion was brought into his community this year and did an extensive business, but for some reason only a few of the mares settled. This subscriber states that he was about to sell a very fine stallion but this competition was a blessing in disguise, as most of these mares were brought to his place and bred this fall, and has made it possible for him to extend the breeding season in his vicinity and cover a greater period of time. This is a good thought and gives one hopes for a better fall season. Every breeder should arrange to have a fall season, for there are a lot of mares that will not fertilize during the spring months but which can be settled in the fall. Sometimes this unnecessary competition results in a stimulated and better business. Mare owners frequently find in this way that their old standby, who has been with them in good and bad times, has their best interest at heart. He has studied the problem from every angle and knows that he cannot cut the prices so that good stallions and jacks can be maintained.

SELLING LIVE STOCK.

There is a buyer somewhere who is just as anxious to pay a fair market value for your surplus animals as its owner is to sell. There is probably no other one thing as much needed in the live stock business as salesmanship. One frequently hears a breeder say that he can not expect to get the big prices that some other individual is receiving. The reason that this individual is complaining is because he has not let the prospective purchaser know in the best way that he has animals for sale. A few breeders expect to find, without spending any money, someone within their acquaintance that will purchase their stock. A little study and experience with advertising frequently proves its value, especially if the advertisement is properly prepared and placed in a publication that reaches the buyers in that particular line. Look through this paper and see what attractions the different advertisements have. Advertising has made more men wealthy than the same expenditures made in any other direction.

Among farmers and breeders there is usually some one in the family that writes a plain hand who would enjoy answering correspondence. With a little instruction a boy or a young lady who has a good memory can take up typewriting and shorthand if the correspondence is heavy, and can be taught to answer inquiries. This is not only a benefit to the advertiser but a good training for the member who does the writing. A little responsibility is a good thing for any young person.

Some breeders change their advertisements each issue. Others place much value on some particular feature that can be kept always in their advertisements; others display a particular herd header; some run a large advertisement occasionally; others keep a small advertisement in their favorite publication the entire year. From a study of the results of advertising we believe that those who have carried their advertisement the year around, always with some distinctive feature, but with an occasional change so that it will be up to date and attract at all times, are the most successful.

During the last few years breeders have been taking notes as to what publication furnishes them the cheapest advertising results. When an inquiry is received it usually gives the name of the publication in which the advertisement was seen. If several papers are being used the name and address of the inquirer is written in a book under the heading of that particular newspaper; then at the end of the selling season the actual buyers of stock are separated and compared with those lists to see just what paper furnished the actual buyers; then the price paid to each paper is considered, and in this way a correct understanding as to the value of a publication as a result getter is measured in dollars and cents.

We are very glad to state that we have had the opportunity of investigating several of these tests and find that the American Breeder furnished the cheapest and most successful advertising in nearly every case. This has been not only with horses and jack stock, but almost any animals or articles needed by breeders and stock farmers. The American Breeder probably reaches more up-to-date horse and jack breeders than any other two publications, so that as a rule the advertiser who only has a few head of stock is soon sold out and we lose his business. But he is a satisfied customer, and when other stock is ready for market an advertisement soon finds its way to the American Breeder. The advertising rates are very cheap, considering the large number of prospective buyers the paper calls on each issue. It takes the message direct to the up-to-date breeders of this country—it places the buyer and the seller in communication. Two issues of an inch ad usually sells a stallion, jack, mare or jennet. The price of this would not buy very much feed and would be a very small commission on a transaction of this kind. Those who have surplus stock can look through the different advertisements in this issue and select about the space they wish to use; count their words, send in their advertisement and we will do the rest.

THE BEST FEMALE PRODUCERS.

The next four issues of the American Breeder will be sent to a very large number of mare owners. We want our subscribers to contribute to these issues. Every one who has had a successful mare, cow or jennet that has raised a large number of offspring that have sold for a good price or otherwise proven valuable, can encourage our new readers. We will welcome articles of this kind for these issues. Animals need not have been extremely good, just so they have been good business propositions. We want our readers to tell us what good results they have had or known with successful females. This will be one of the best stimulants to the breeding business. Don't wait for some one else to write, just begin to write now if you know of a case that is above the ordinary.

SLOW JACKS.

There is probably no one thing as disgusting in jack breeding as to have a "slow" jack. We have been making many investigations in an effort to find something that could be fed to these animals without any serious injury. We have found a remedy that has given some results, but we do not care to publish it yet until it has been tried more extensively.

Those having animals of this kind who wish to experiment, can send us their name and address and we will send them this remedy free of charge, providing those who use it will write us concerning the results of the actions of the animal, as well as future results concerning foal production. We want only about 25 men and the first ones who write will receive this treatment.

THE PERFECT LIVE STOCK BREED

In England there are two breeds of cattle that spring from about the same foundation, one the Shorthorn, the other the Longhorn. One breed is about as old as the other. Shorthorns are now valuable all over the world. The Longhorn cattle are known in their own vicinity. Very few people in other countries know that there is such a breed of live stock. The writer was much impressed with the care and preparation these cattle receive at the Royal Agricultural show and other smaller shows and have received for years and at the fact that the same farms and families are still propagating this particular class of stock. They are very large cattle but not quick developers; neither are they as profitable as meat producers; in fact, they do not compare favorably with the Shorthorn cattle in any respect, yet the backers of this breed of cattle are greatly offended when asked about the merits of this stock. They believe they are the best cattle in the world. The question is, have the few interested breeders miscalculated on the quality of this stock or has the rest of the world been mistaken?

There is material for thought in this example. There are a lot of breeders who are not willing to concede that some other strain of stock has good

THE HORSE BREEDING SCHOOL

NEXT TERM FEBRUARY 17 TO 22

Breeders with money invested in the business cannot spend a week's time and their tuition fee to better advantage. Fathers and mothers need not be afraid to send their boys. Ask any graduate.

Here are some more new letters, published for the first time. We have never had space to print all we get.

I have attended two terms of the Graham Scientific Breeding School and I think it is a wonderful institution. Each session of the term, in my opinion, is worth the tuition asked for a life membership, and it is impossible to make a failure if the instructions given there are followed, and besides being taught to be breeders, we are taught to be gentlemen—to be fair and honest in whatever we do.—A. J. McLarty, Starkweather, N. D.

I think the school is one of the grandest and most instructive schools for all horse owners, both old and young, and boys as well as not. I feel that I have been well paid by attending.—E. A. Gimple, Mankato, Kas.

I have attended the school and am well pleased with the way it has benefited me, and I know it will be of benefit to any man or boy if they would take a course, whether they ever owned a stallion or not.—Wm. Hartman, Baring, Mo.

I was greatly impressed while attending the Graham Breeding School. Each instructor was very strong in his line, and all exert an influence for better citizenship and morals. It is the best place any mare owner or breeder can spend a week's time to learn about barren mares and all mare and stallion diseases. It is worth many times the cost, just for the help that you can give your mare owners. The outside people do not appreciate these men's efforts as much as they should. Attend the school and be convinced.—T. C. Danskin, Colo, Ia.

I have attended the school and am well pleased. I think every one that has stock should attend. I would not take twice what it cost. Send your boys, they will not learn anything bad—some even get religion at this school. I was surprised to see the way it is conducted.W. T. Head, Lizton, Ind.

Having attended the school, I can not speak too highly of it. The instructors are all men of high ideals, not only along the line of scientific breeding, but in a moral way. The members of this school are men that will go home with a strong desire to be more useful, not only in the breeding business, but will have a strong desire to be better citizens. No man need fear to come or send his son on account of the training or morality of the school.—A. W. Shriver, Spivey, Kas.

I have attended the Graham Scientific Breeding School and was greatly surprised at what was done there. Money could not buy what I have learned. I would advise every stallion and jack owner to attend this school.—Frank N. Taylor, Meridan, Idaho.

I have attended the Graham Breeding School and can say it is worth all the money it will cost you, no matter where you live. It has cost me, so far, about $75, and money could not buy the things that I have learned.—J. W. McDonnell, Humboldt, S. D.

I have attended the Graham Scientific Breeding School and I consider the time very well spent. I think the knowledge gained there will be of inestimable value to me, not only in dollars and cents, but in the moral uplift. No father need be afraid to send his son here, because the instructors are men of unquestionable Christian integrity. Every mare and stallion owner should attend at least one term. The lecture on "Diseases of the Foal and Fetus" is alone worth the tuition. May the school continue.—Rolland Knoche, Onarga, Ill.

I am very much pleased with the knowledge gained by my attendance at one term of the Graham Scientific Breeding School.—C. R. Atwood, West Chazy, N. Y.

After attending the school I can recommend same for high class instruction and moral teachings as second to no institution of this kind. No young man who intends to engage or is engaged in the breeding business can afford to miss attending at least one term of this school.—D. B. Coffin, Dunkley, Col.

I think the school is a success from every viewpoint, and I do not see how any breeder can get along without a course.—D. M. Gilchrist, Glasgow, Mo.

I have been attending the Scientific School, and state frankly that I was more surprised at the work that is being done here, not only in horse breeding, but in the making of better American citizens. No father or mother need be afraid to send their boy to this school; if they will get him here he will sure not go astray. We have had several lectures here before this class and any one of them is worth the price of the whole term. If every man and boy (over 14 years old) could only attend this school our mothers could sleep better when their boys went to the city.—H. O. Wyland, Kirkman, Ia.

I have attended the school and will say that every horseman should attend, as what you learn here in one day will pay your tuition.—J. K. Stevens, Park Rapids, Minn.

Having again attended the Graham Scientific Breeding School, will say it was good the first time I came, but still better the second. I do not think any man who will attend this school, and follow its instructions, can keep from being a better man mentally and morally.—Guy W. Armstrong, Galesburg, Ill.

Can certainly recommend the school and its instructors and their high moral character. The lecture on "Germs" was certainly worth the tuition and an "eye opener" to the careless.—Chas. Baldwin, Ada, Kas.

I have attended the school and will recommend it to anybody who is interested in scientific breeding, both from a business and moral standpoint.—A. E. Bennett, Marsland, Neb.

I have attended the school and have learned a great deal about horse breeding, and I think it is a good place for young boys to go, as it is a good moral school.—W. T. Wilkins, Newburg, Mo.

I have attended the school and it was far beyond my expectation. Any one of the lectures was worth the money.—Leon Le Claire, Willow Lake, S. D.

I have attended the school and was more than pleased. I would advise every stockman to come to this school.—H. J. Chrane, Rocky Ford, Col.

I have attended the school, and my opinion is that for the average man who has not thought very much upon this subject, it would probably be very much to his interest, both intellectually and financially, to do the same.—G. B. Chandler, Buffalo, Kas.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demontrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs. Physiology of the Generative Organs. Cells. Infection. Breeding Questions. Breeding Instruments. Foaling. Scientific Mating. Horse Judging. Mule Judging. Barren Mares. Barren Stallions. Abnormal Conditions. Diseases of the Foal and Fetus. Diseases of the Male and Female. Contagious Abortion. Feeding. Testing Breeding Stock. Determining a Mare's Breeding Condition. Buying Breeding Stock. Hereditary Defects. Horse Breeding. Rectal Examinations for Abnormal or Diseased Conditions; also for telling whether a mare is in foal or not. Getting the Semen. Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL

225 West Twelfth St., Kansas City, Mo.

features, and that their selection may not be the best in every particular. Every intelligent breeder should be willing to listen to an explanation concerning good qualities in any breed of live stock. There is no one breed absolutely perfect in every respect. The inferior characteristics of a strain of stock can be largely eliminated by a more careful selection of sires, but if the breeder thinks he already has perfection in his breed, he is not likely to exercise the discrimination necessary for making this improvement.

QUESTIONS AND ANSWERS.

(Continued from page 5).

tion has been given to the conformation. J. Crouch, Lafayette, Ind., is the secretary of the German Coach Society in this country.

FEEDING STALLIONS—I have two stallions, coach and draft, coming 3 and 10 years old. Are not fat at present but are both sound and O. K. They are worked and run in lot for exercise every day when weather is fit. Now I want to begin a line of feed and care that will put them in good shape and flesh by early spring. I have good, sound ear corn, oats, wheat, bran and wheat middlings, also oil-meal, mixed timothy and red top hay and corn fodder and wheat straw and would like to know how to best combine and feed these feeds to best advantage to bring the desired results. I desire to feed as much corn as can be properly used. To what extent can wheat middlings be safely fed to horses? The local veterinary tells me it is unsafe and I would like to feed it if I knew how to use it safely.—Ohio Subscriber.

REPLY—It is not a matter of cost in feeding stallions, but rations must be administered that will give the best results, regardless of cost. Oats and bran, equal parts by measure, with your mixed timothy and red top hay, with a little corn fodder and wheat straw, will give you the best results. The amount of bran can be diminished or increased to regulate the bowels. Begin your feed moderately and gradually increase a little, just enough to keep your horses in a good physical condition. Do not increase the flesh too rapidly.

BREAKING A JACK—I wish you would please tell me how I can break a 5-year-old jack for service. I have brought mares in his lot and he seems to be afraid of them.—Mississippi Subscriber.

REPLY—It is quite likely that you will have trouble with this animal. Tie a good gentle mare in the stall next to him that is in good heat until he gets more familiar with mares. When you are ready to serve put the mare in a pit and put a twitch on her so that she will not make any noise; do not give her any opportunity to fight or frighten the jack, and handle him very gently. This service should be attempted in an enclosure, excluding all men, dogs, cats or other objects that might attract his attention. Be gentle at all times with this anmial.

JACK SERVICES—I have a jack coming 4. How many mares do you think he ought to go to this spring and how often to breed a mare. Some say nine, eighteen and twenty-one days. I see you recommend twenty-first day, if you think it best I will use the twenty-first day this season.—Texas Subscriber.

REPLY—An average of one service a day or no two services closer than ten hours should be sufficient. Mares should be returned for retrial on the twenty-first day after being bred.

WOULD YOU REFUND THE MONEY?

To the American Breeder:—B stands a stallion; terms, colts must stand and suck, but if mare is sold or leaves the country, season is due at once. C breeds his mare, gets her in foal; C sells his mare and pays B the season short one dollar, as that is the way B said he settled for those that were sold before foaling. The mare only went a short distance and when the mare died four days before her foaling time with swamp fever, the colt came dead a couple of hours after the mare died. Now C thinks B ought to give him another season. What is your opinion about this?—Kansas Subscriber. (Subscribers please answer.)

Horse Market Shows Big Gains

Early January Mule and Horse Trading Doubles Same Period Last Year. Sheep and Feeder Cattle Made Price Records. Other Lines Less Active.

The trade in horses and mules the first half of this month was above expectations and in direct contrast to the first half of January, 1912. Dealers in both Kansas City and St. Louis say that the trade this year is making up for the slump it took a year ago, though weather conditions a year ago were responsible for the slack demand. At the two above mentioned markets receipts of horses and mules the first half of this month were more than double those of the same period last year, and there has been practically no hitch in the trade. Good clearances have been reported almost daily and prices are firm. The bulk of the inquiry is coming from the South and Southwest. That trade has opened up unusually early, as planters are anticipating an early seeding season, and dealers supply the planters, the dealers are getting their supplies now. Kansas City and St. Louis being the natural gateways for this trade, they have reported more activity than other markets. One other class of animals in excellent demand is brood mares. Good ones are scarce at markets, and country buyers say farmers are unwilling to part with them at a reasonable figure. The Eastern drafter trade is opening up rather slowly, but weather conditions there have been unfavorable for outside work. Some expressers and chunks have been the principal Eastern requirements. The real activity in farm horses for the Central West will not be well under way before the middle of February. That demand is expected to be of large proportions as farm requirements will be large, and some sections that suffered big losses will have to replace the shortage.

This winter's feeding operations has been a big factor in producing the right class. This is more noticeable on mules in this section than for horses, though in the East horses predominated in feed barns. The constantly increasing spring requirements which assure a good spring market will establish winter feeding of horses and mules on more certain lines. A liberal percentage of the mules in Kansas and Missouri feed lots have already been disposed of and there is plenty of demand in sight to care for the rest. Feeders bought their thin mules pretty high last fall, and in early winter, but so far all reports state that a fair profit has been realized.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up..	$235@285
Drafters, fair to good	150@230
Chunks, good to choice.....	135@165
Chunks, fair to good.....	85@120
Expressers and light draft...	50@110
Plain workers	40@ 85
Southerns, good	120@135
Southerns, plain to fair.....	60@115
Plugs	20@ 55
Mules—	
13 to 14 hands.....$....$	75@120
14 to 15½ hands.....	110@150
15½ to 16 hands.....	140@185
16 to 16½ hands.....	180@265

Sagging Cattle Market.

The cattle market in the past two weeks has been on the down grade and prices now are 25 to 50 cents lower than two weeks ago. The greatest decline has been on the better class of steers or the kind that have become heavy in weight. There the exact position of the market breaks off for the supply of prime finished steers at river markets has been practically nil, and in Chicago only a few have been good enough to bring $9.25. The supply is made up of the short fed variety and many of them have been put through only enough feed to make a showing, but strange as it may seem, the kinds that show the least feed are making relatively the best price level. That to a large degree is due to the fact that killers have to meet country buyers' competition. Short fed steers are selling at $7.25 to $8.25, and above that point they begin to show considerable feed and some finish. A few bunches of Western hay fed steers sold at $6.50 to $7.00, and the large part of the Texas and Oklahoma meal fed steers brought $6.50 to $7.50. A few common Arkansas steers sold at $4.50 to $5.50. Receipts are holding up better than expected, but in the face of the reported shortage in the feed lots, the present run is at the expense of future supplies. Chicago territory is marketing more freely than any other section, and practically the entire receipts there are beef steers. At river markets beef steers predominate, though in smaller percentage than in Chicago. The general weather continues favorable for feeding, and there is plenty of feed to carry cattle on to grass and make good corn beef for next fall.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers.....	$8.50@9.25
Good to choice steers.....	7.75@8.50
Fair to good steers	7.25@7.75
Common to fair steers	5.50@7.20
Meal fed, choice	7.00@7.75
Meal fed. common to fair...	6.00@7.00

Butcher Cattle Prices Firm.

Butcher cattle continue to bring steady prices. The only changes have been made in the shape of fluctuations of about 15 to 25 cents, but that narrow movement is unimportant at this season of the year, as there is a wide range in quality. Buyers, however, appear anxious for all classes of butcher cattle, and the small supplies are sustaining prices. Few farmers have fed heifers this year, and where half fat kinds are offered they receive bids from both killers and feeders. Spring demand will probably be more urgent than at present, as the beef trade then depends on its supply of swell cuts to come from tidy weight heifers. Veal calves and bulls continue in active demand.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice .....$	6.50@ 7.50
Fair to good	5.00@ 6.40
Common to fair	4.00@ 4.95
Canners	3.50@ 4.00
Heifers—	
Choice fed .....$	8.00@ 8.50
Good to choice	6.50@ 8.00

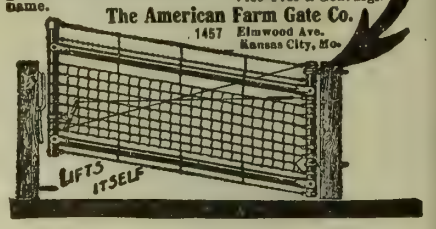
Unprecedented Feeder Market.

Feeding steers up to $8, in January, and the bulk of the thin steers selling at $6.75 to $7.50, is the present status of the stocker and feeder market. Such prices were never paid for thin cattle at this time of the year, and from the

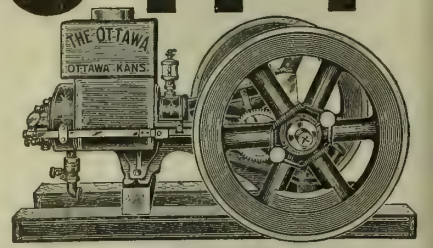
Selling Faster Than Ever Before

To the American Breeder: I like your paper exceedingly well, and am selling horses faster than ever before. We have sold, within a radius of ten miles, nine head in less than ten weeks—something no one has done before—and all horses went to different parties.—John W. Waddill, Adair County, Missouri.

MONEY SAVING GATE BOOK FREE



I want every reader of this paper to have and read my Money Saving Gate Book. You can have one copy free if you will write me at once. This booklet tells you all about my



American Self-Lifting Galvanized Steel Gate

The only gate made with frame and couplings of 2-inch high carbon drawn steel galvanized tubing, equipped with an Automatic Equalizer, which allows the gate to Lift Itself and swing clear over uneven ground or snow, and a Ratchet Stretcher System which insures a tight, rigid gate forever. REMEMBER: This is the gate sold on a Three Years Guarantee. The gate that must be exactly as represented or you get your money back by simply returning it to your dealer. Write me today for my FREE gate book and nearest dealer's name.

present outlook it appears that prices will go higher before they come in for any material drop. The scarcity of stockers and feeders, and a broad general demand, is sustaining the market.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.50@ 8.00
Good to choice feeders	7.00@ 7.40
Plain to fair feeders	6.00@ 6.85
Selected stockers	7.00@ 7.50
Good to choice stockers	6.50@ 7.00
Plain to fair stockers	6.00@ 6.45
Stock calves	5.50@ 7.50
Stock cows	3.85@ 4.25
Stock heifers	4.50@ 6.25
Milch cows	35.00@90.00

Hog Prices Break and Recover.

Hog prices in the past two weeks broke and recovered a couple of times and at the close yesterday were in practically the same position as two weeks ago. Saturday of last week the market broke 20 cents and Monday and Tuesday was marked still lower, the early Wednesday market being the lowest of the season. Thursday prices turned up, and yesterday were 10 cents higher than the preceding day. Prices now are considerably higher than a year ago, and receipts of hogs at the five Western markets thus far this year are about 175,000 short of the same period last year. Average weight now is holding 10 to 15 pounds heavier than a year ago, and this increase to some extent affects the decreased number of hogs marketed. Traders still assert that February and March runs will be light. One of the big packers recently asserted that the hog market now is in practically the same position as it was in 1910 when in the following March prices reached $10.90.

The following quotations are for hogs:

Choice, 250@300 lbs	$7.40@7.45
Choice, 200@245 lbs	7.25@7.45
Medium weight	7.20@7.40
Light weight	6.50@7.25
Common to fair	5.75@6.75
Stags	5.60@7.25
Boars	4.25@6.75
Bulk of sales	7.25@7.40

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Jan. 13	$7.00@7.30	$7.10@7.45
Tuesday	6.95@7.25	7.10@7.40
Wednesday	7.00@7.30	7.10@7.42½
Thursday	7.00@7.35	7.15@7.45
Friday	7.10@7.45	7.15@7.50
Saturday		7.00@7.30

Sheep Advance and Fall Back.

The first week in January sheep prices bounded up 35 to 50 cents to the highest levels ever reached in January. This brought out increased offerings, and prices this week fell back about as much as they advanced in the former week. At the high point last week lambs sold up to $9.30, yearlings $8.00, wethers $6.00, and ewes $5.50. Since then 25 to 50 cents was quoted off, and prevailing quotations now are $8.00 to $8.75 for lambs, $7.00 to $7.50 for yearlings, $5.00 to $5.50 for ewes, and $5.25 to $5.75 for wethers. Traders are predicting higher prices in February, and record breaking prices in March.

SOMETHING DIFFERENT IN STALLION FENCE.

To the American Breeder:—I will give you the description of how I built a stallion fence. First, I got some good heavy 12 foot posts for corners; set four feet in ground and braced well. I set these so as to take in about two acres. Next, I set my smaller posts 10 feet apart and eight feet high. On the outside of these posts and at bottom I stretched 36-inch hog wire; then on the inside of post I put a 48-inch wire, starting about four inches below the top of bottom wire, or 32 inches from the ground. This will put your horse the thickness of post farther away from bottom wire than top and he is not so liable to put his feet in it. I staple these wires good and on top of the post about six inches from the woven wire, put a barbed wire. This will keep the horse from trying to put his head over the fence and cause your fence to sag. I make my gate out of 2x4s and 8 feet long, spiked to a 2x6 frame. I put these four inches apart upright and the smooth side on the inside paddock. I also have my barn so the horse can go from paddock to stall. I also have a barn door gate built as I have mentioned, so I can put a mare in paddock and shut horse in barn. This you will find a good way to catch a mare in heat. She will never go near the gate until she begins to come in. I have this paddock seeded well to grass. I believe this doubly pays for itself every year. Your horse gets exercise, grass and fresh air, and I would say 20 per cent more colts.—L. E. Ditto, Mercer County, Ill.

Each a Lucky Car

By R. E. Olds, Designer

In every make an occasional car proves almost trouble-proof. No breakdowns, no repairs.

The man who gets it tells his friends he got a lucky car.

But every buyer of Reo the Fifth gets a lucky car. This is how I insure it.

How I Do It

A lucky car means simply a car built with proper care and caution. I have spent 26 years in learning all that is necessary.

I have all of my steel made to formula. Then every lot is analyzed twice to prove its accord with the formula.

Then the finished parts are tested. In every part I require over-capacity, not less than 50 per cent.

The gears are tested in a crushing machine, to prove that each tooth will stand 75,000 pounds.

Springs are tested in another machine for 100,000 vibrations

Added Cost

I use big tires—34x4—to save you tire expense and trouble. This year, by adding 30 per cent to my tire cost, I have added 65 per cent to the average tire mileage.

I use in this car 190 drop forgings, to avoid all hidden flaws. Steel castings would cost half as much.

I use 15 roller bearings—11 of them Timken, 4 Hyatt High Duty. The usual ball bearings cost one-fifth as much, but ball bearings often break.

I use a $75 magneto to save ignition troubles.

I doubly heat my carburetor—with hot air and hot water—to deal with low-grade gasoline.

I use a centrifugal pump, instead of a syphon, to insure positive circulation.

I use 14-inch brake drums for safety. Also seven-leaf springs, two inches wide.

1,000 Tests

The various parts of this car, during the making, get a thousand tests and inspections.

Each engine, for instance, is tested 48 hours—20 hours on blocks, 28 hours in the chassis.

Fitted parts are ground over and over, until we get utter exactness.

Each body is finished with 17 coats. It is deeply upholstered with genuine leather, filled with the best curled hair.

The electric dash lights are set flush with the dashboard. Thus the car's appearance shows the care we use.

Center Control

No other car has such easy control as you find in this Reo the Fifth.

All the gear shifting is done by moving a handle only three inches in each of four directions.

Both brakes are operated by foot pedals. So the car has no levers, either side or center, to clog the way in front.

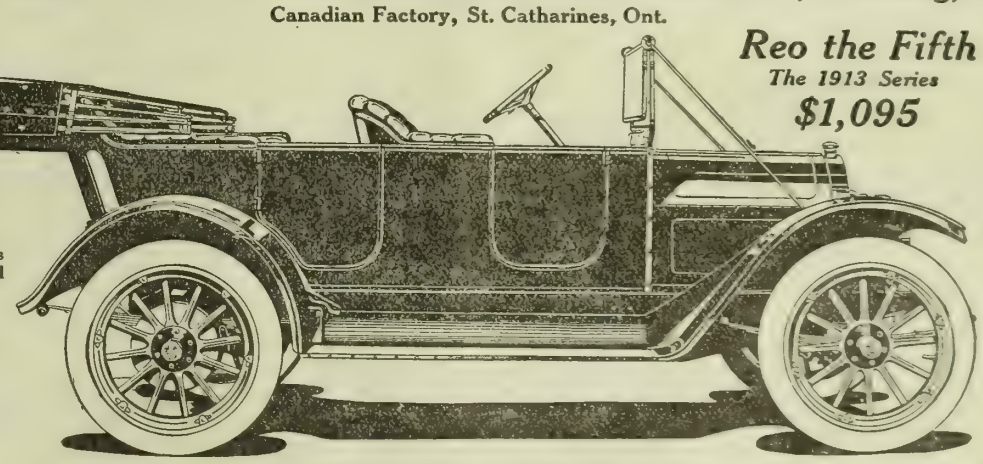
You get in this car the wanted left side drive. The driver sits close to the cars he passes. Yet you shift the gears with your right hand, just as with the old right hand drive.

Costs Me $200 Per Car

Reo the Fifth, without these precautions, could be easily built for $200 less. For the first few months you might not know the difference. But in years to come this skimping might cost you several times $200.

I know this well, for I have built cars for 26 years — over 60,000 of them. I know the cause of troubles.

I save this $200 per car by building only one model, by building all my own parts, by wonderful factory efficiency. And I put that saving into these extremes, to save you after-cost.



If you think that it pays to have a car like this, ask us to send you the details.

Our thousand dealers now are showing the 1913 model of Reo the Fifth. Write for our catalog and we will tell you where to see the car.

R. M. OWEN & CO. General Sales Agents for **REO MOTOR CAR CO., Lansing, Mich.**

Catalog free. We also offer for sale recorded Shire fillies and mares in foal. Address, **B. M. Boyer & Sons, Farmington, Iowa.**

HOW ABOUT A "MARE LAW?"

To the American Breeder: Iowa has had one year's trial of the stallion and jack law—they say for the benefit of the breeder. Maybe it is a benefit to them, but where does the stallioner come in? It is not going to help him any that I can see. It appears to me that it is very risky to own a valuable stallion under this law, beccause if some accident happens to him and he gets some blemish he will be disqualified. Iowa leads the states in the number of pure bred stallions and she reached this position without a stallion law. My idea about a stallion law is to protect the man that pays two or three thousand for a good stallion. Make a law that will encourage him to get the best, but do not rob him at every turn, as the law is doing now. Give him a profit large enough so he can get the best. He has to hire a veterinarian and pay him out of his own pocket, whatever he asks, every year and send in certificate with $1 to the secretary. They say we must have a stallion law because the other states have them, and if we do not Iowa will be used as a dumping ground for unsound stallions. Then let us have the law that prohibits shipping unsound stallions into Iowa. If they are bound to have the law we now have to get better horses, as they claim, then I say place the brood mares under the same kind of law, because we have a lot of blemished brood mares that would not pass inspection. If it is the aim of the Iowa law-makers to get better horses in Iowa and to protect the stallioner, let them pass a law that his service fees will be paid without any expense to him, and if the breeder sells a mare he must give the buyer a receipt from the stallion owner that the service fees are paid, and if he does not do that the man who buys the mare is also liable. We all know that as a rule the stallion men are not rich. I never knew of one who got rich at the business, but they have done a lot of good. They have had the nerve to put their money into good stallions but they have not received the reward. —C. B. Dannen, Marshall county, Ia.

A WORD TO IOWA BREEDERS.

To the American Breeder: I would like the attention of every stallion and jack owner in Iowa long enough to read what I have to say. There are about one-third of the stallion and jack owners in Iowa that do not know about the new stallion and jack law that went into effect one year ago. In traveling not very far I can find several stallions that have not the required certificate of soundness that did stand for service last season. The owners are ignorant of the fact that it is a violation of the law, and that any one doing so shall be guilty of a misdemeanor and be punished by a fine of not more than $100, or imprisoned in the county jail not exceeding 30 days, or by both fine and imprisonment. This law also applies to a stallion or jack that is offered for sale or exchange, as well as one standing for public service. Any one that did not comply with the law and have his stallion or jack registered with the Iowa State Department of Agriculture, A. R. Corey, Secretary, Des Moines, Ia., cannot collect the service fee of his stallion or jack by law, or in other words the man that gets a colt from one of these stallions or jacks does not need to pay for the colt. There is an expense attached to getting this certificate of soundness.

Now I see no reason why we (the stallion owners) cannot get some law by which we can collect the service

FOR SALE OR TRADE FOR LAND.
My property and breeding stock located in Princeton, Kas., 67 miles southwest of Kansas City, Mo., consisting of seven lots 50x150 feet; one 9-room house, and one 3-room house.

Breeding stock: Two jacks (King, 6 years old; 15¼ hands; Brigham; 11 years old; 15 hands). Both black with white points. Good breeders; extra heavy bone; colts to show.

Two stallions (Boquillon 41811 (59377), black; 9 years old; weight 1800 pounds, and David Lill 32329; 13 years old; weight 1200 pounds; bay, solid color.

Plenty of shade and living water. Good stand. No opposition. Want to change on account of health. **W. J. Ford, Princeton, Franklin County, Kas.**

IRRIGATED FARM LAND
With an Abundant Water Supply.
Grazing Land (Watered) and Timber for sale in Southeast Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Oats yields 30 to 80 bus.; wheat, 20 to 60 bus.; barley 30 to 80 bus.; potatoes 150 bushels and up; beets highest sugar content; alfalfa 4 to 6 tons per year and all grasses do well.

The climate here is exceptionally good.

Mining towns make good markets. Eggs average 30c; butter never less than 30c; oats $1.25 and up, per hundred; wheat, $1.50 and up, per hundred. For good values in land, or any reliable information, write
W. L. Morse, Mancos, Montezuma Co., Colorado.

Registered stock a specialty; a limited number for sale. **W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.**

REGISTERED MORGAN HORSES.

My Morgans are large; 15 to 16 hands and 1,050 to 1,300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted. Weanlings to 3 years old for sale by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. **Richard Sellman, Rochelle, McCulloch County, Texas.**

HORSE BREEDING POSITION

Wanted by graduate of Graham Scientific Breeding School. I am a young married man. Have handled live stock, mostly horses, all my life; references furnished. **G. L. Deer, New Market, Indiana.**

fee of our stallions and jacks. The law now in effect amounts to nothing, as it gives the stallion owner a right to file a lien on the colt up to the time it is six months old, and then you are out unless you can sue the mare owner and collect the fee that way. Six months is not enough time as about one-third of the service fees are not paid until the colt is past that age, and if the colt should die when it was about four weeks old, and the mare owner is a dead beat, how will I collect the service fee? And again, we will suppose that the mare owner is a stranger to me, but I have learned that he is a poor man and I am willing to give him time. And then when the colt is about five months old I find that this man is a rascal and will not pay his debts. Then I will go and see him and he will make a good promise, so I wait a little longer until the colt is six months old and then I get nothing. I have been in the business for nine years and know something about it. What we want is a law that will give us a lien on the mare and the colt (if she has one) for two years from the last date she was bred.

I want every stallion and jack owner in Iowa to write to their representative, asking them to work for a law of this kind. Now is the time to write as they are in session at Des Moines. Right now is the time. Don't wait. Some of you may say that you do not have any trouble in collecting the fees for your horse or jack, but your time is coming. It will only cost you two cents now; after a while it may cost you $15 to $30. A stitch in time will save nine. My advice is to take the stitch in time, as this kind of a law will not injure your business—it would protect you, and me and the honest mare owner. F. W. Moeller, Calhoun County, Ia.

A PLAN TO DIVIDE THE RISK.

To the American Breeder:—I keep three stallions and three jacks and think I have a good plan that we stallion owners should all adopt. I have the names of 14 stallion owners in and around Courtland that have agreed to collect one-half of service fee at first service of the mare, balance due when mare has living colt.

(Continued on page 14.)

IMPORTED STALLIONS. BELGIANS AND PERCHERONS.

Have just arrived from Belgium and France with new importation of Belgian and Percheron stallions which I would like for you to inspect before buying elsewhere. Barn in town. **C. W. Babcock, Walford, Benton County, Ia.** Walford is 4 miles southwest of Fairfax on C. M. & St. P. R. R.

PERCHERON STUD

For sale or trade for mare or fillies. Pink Parader 34928; registered in P. S. of A.; 7 years old; weight 2200; a sure breeder, also a good breeder; sire the great horse, Pink 24765. **August Radloff, Libertyville, Lake County, Illinois.**

Our stallions are all blacks and grays; all young; sound and ready for service. Some ton three year olds, as good as grow. All registered in P. S. of A.
Our Mammoth jacks are Kentucky and Missouri bred; all blacks with light points; all two years old and over; all registered and every one has size and quality; all broke to service. We give a liberal guarantee with all stock. Come and see us or write. Barns in town; 50 miles north of Kansas City and 35 miles east of St. Joe on Rock Island and Burlington.

FIRKINS & PARK, CAMERON, MO.

PERCHERON STALLION WANTED.
Also Percheron Mare and Jack.

I want young Percherons, good conformation and action and black preferred.
Want a jack, 15½ hands, standard, with good bone and body and a good performer and breeder.
Give full description and lowest cash price in first letter.
Orville Mills, Cedarvale, Kansas.

SMALL BREEDERS ON SMALL FARM

Near Town, We Have For Sale

4 Black Percheron Stallions, 3 years, all registered in the P. S. A. and weighing 1850 to 2100 pounds. They are all first class and will be priced to move them.
Good jacks also for sale.
C. R. Porter & Son, Novelty, Mo.

FRENCH DRAFT STALLION

for sale; four years old past; 1800 pounds now in common flesh; he ought to make a ton horse when full grown in his old clothes. Lots of good colts to show, and mares in foal. Will sell him cheap for cash, or trade for a good Belgian or Shire. **M. P. Lydon, Cresco, Howard County, Iowa. Rte. 1.**

FOR SALE OR TRADE

One good grade Percheron stallion; color brown; weight about 1800. Registered as sound by Illinois Stallion Registration Board. Write **Wilber A. Terpening, Galesburg, Knox County, Ill. Rte. 6.**

Draft and Coach Stallions

A fine bunch of Percheron, Belgian, French Draft and Coach stallions for sale; priced from $350 up. I have the big ton kind that are right. Come and see me, or write. **J. M. Nolan, Paola, Miami County, Kas.**

YOUR CHOICE OF IMPORTED PERCHERON AND BELGIAN FORD STOCK FARM stallions at $100 profit. Absolutely first cost revealed in plain figures; the best money can buy. Positive guarantee with every purchase. Correspondence, inspection and personal acquaintance solicited. Investigate. **Ford & Harrington, Parker, South Dakota.**

THE BEST VALUE.

Home grown registered Percheron stallions of substance; 2 and 3 years old; grays and blacks. Big straight fellows that will pay you. It is worth a stamp and a moment's time writing to know about these. South Central Iowa.
Fred Chandler, Route 7, Chariton, Ia.

THREE DRAFT STALLIONS

for sale. 6 to 8 years old; 1850 to 2100 pounds; 2 Percherons and 1 Clydesdale; all registered. Good breeders, but their fillies are in their way.
Five Jacks for sale also; the big kind, 15½ to 16 hands; black with light points; yearling to 6 years old.
Five Hereford bulls—long yearlings and good.
J. R. Brooks, Cairo, Mo.

IMPORTED STALLION

for sale or trade for grade horses or mares. Is eight years old; sorrel; sound and a good breeder: colts to show. **W. P. Smith, Monee, Will County, Ill. Rte. 3.**

REGISTERED PERCHERON STALLION

for sale; six years old; dark blue grey; weight 1,900 pounds in breeding condition. Guaranteed sound and a sure breeder. A low down, wide out fellow and a great sire of heavy draft colts. Works on the farm in all harness. Plenty of colts to show. He has great action and can't help but suit. Will sell him cheap. **C. A. Folts, York, York County, Neb. Rte. 1.**

PERCHERON STALLION

for sale. Dark brown; 16½ hands high; good breeder. Colts to show. Broke to work single or double; sired by the imported stallion, Payson (15486) 25937, dam a very much grade Percheron mare. Priced to quit business.
Will take a good Shorthorn, Polled Durham or Red Polled bull as part pay. **E. L. Jones, Forgan, Beaver County, Okla.**

REGISTERED PERCHERON STALLIONS

for sale. These are ton horses and prize winners; of massive build and great action; 3 and 5 years old; kind and gentle. Guaranteed sound and sure breeders. Give them a look before you buy. **R. E. Pratt, Shenandoah, Page County, Iowa. Rte. 1, Box 12.**

BURRESS BROS.

Breeders of Percheron and Belgian Horses.

We have some good, big boned draft stallions for sale of all ages. Our horses are pasture raised and acclimated.

We showed our horses at Nebraska and South Dakota State Fairs and the Interstate Fair at Sioux City, Ia., 1912, and won eighteen prizes.

We still own, and are breeding, the imported mares that we won first and sweepstakes on at Nebraska State Fair in 1908. We also have some good, big, high grade colts that will make ton horses.

Write us, or come and see our horses before you purchase. Barns in town. Carroll is located on the C., St. P., M. & O. Ry., sixty miles West of Sioux City, Ia., and 120 miles West of Omaha.

Reference—First National Bank, Carroll; Citizens' National Bank of Wayne.

Burress Bros., Carroll, Wayne County, Nebraska.

PERCHERONS AND JACKS

for sale. "Don" 72956; black Percheron; foaled 1909; a sure breeder of fancy colts; easy to handle; broken and used every day in farm work; weighs 1,700 pounds in working order. Price $800.

"Coco" (84587); black Percheron horse colt; foaled 1911. $500. These animals have never been pampered or unduly forced. Both are rich in brilliant blood.

"Dan Taylor, Jr." 3194; jack; black with white points; 15 hands; very large boned; fancy head and ears; sure foal getter of dandy mules; quick worker. $1,000.

Will take registered mares or fillies in trade for any of above stock. We have a surplus of stallions and jacks. **Borden Stock Farm, Tonti, Marion County, Ill.**

IMPORTERS OF PERCHERONS

and dealers in American bred draft horses and Standard bred horses and high class jacks. Will sell at right kind of prices and terms to suit purchaser. Give us a look before buying elsewhere.

Fisher & Walker, Evansville, Indiana.

PERCHERON STALLIONS AND MARES.

We have 45 head imported and home-bred Percheron stallions and mares for sale—an extra good bunch of horses. Our stallions are coming 3 year olds (many will weigh a ton now) and some 3 year olds that will weigh 2150 pounds. Good mares from weanlings to 4 years old. **Ben Bohlander & Son, El Paso, Woodford County, Ill.**

A High Grade Percheron Stallion

For sale or trade for young live stock. A good horse to buy and turn out on the range. He is a beautiful seal brown; has fine disposition; will work in any harness; eight years old; weighs 1800. A very sure breeder and a good sire; have colts to show. Is sound and right in every way. For particulars write. **D. L. Steefe, Sedgwick, Harvey County, Kas. R. F. D. 4.**

150 STALLIONS.

Home bred draft stallions, $250 to $650. Guarantee to sell you imported stallions for less money than any firm in America. Come to a live stallion market and see all draft breeds. **A. Latimer Wilson, Creston, Iowa.**

TWO GOOD PERCHERON STALLIONS

For sale or trade; three and four years old. Will trade for good, big jack or good, big standard bred stallion. Also some good, big jennets bred to Jack; 16 hands high with as much bone as I ever saw on a Jack, and a good one. Also good black Jack, coming yearling. **A. M. Perkins, Washington, Davies County, Ind.**

Imported Percheron

stallion for sale. Black; 12 years old, weighs 1800 pounds. This horse is a good breeder and good actor, but has been here 8 years and the county is full of his fillies so must sell or exchange him. **Simon Hinschberger, Rte. 2, Sanborn, N. D.**

SHIRE AND PERCHERON

Stallions and Mares.

Imported long enough ago to be thoroughly acclimated and in thrifty condition. Good horses with quality at reasonable prices. Inspection invited. Will meet you at C. R. I. & P. or Interurban Ry., if notified. **H. P. Wilkinson Bros., Mitchellville, Iowa.**

FIVE REGISTERED PERCHERON

stud colts; all blacks; coming two years old. They won three first prizes in a show of 37 colts, Shelby County Colt Show. All sound; sired by my imported herd stallion, Gringalet (68210) 50724.

Prices $250 to $300 each.

H. O. Wyland, Kirkman, Shelby Co., Ia.

PERCHERON STALLION

To trade for one equally as good. Ouvrard 49255; black; 8 years old; weight 2100 pounds; sound; very sure; extra heavy bone. Reason for trading, his fillies are in his way. Prefer a gray. Must be a ton horse. For further particulars, write **H. W. Bowman, Mt. Carroll, Carroll County, Ill.**

Wanted---Good Draft Stallion

and good jack to work on shares with view of buying. Good business. Lost my stock in fire December 24. Have had three years' experience. Can give best of references. **Geo. Hurley, 927 Chickasha Ave., Chickasha, Okla.**

REGISTERED CLYDESDALES.

One Clydesdale stallion; coming three years old. An extra nice individual and well broken to work. One coming yearling and one coming two year old filly. **Lindley W. Baker, Milton, Wayne County, Ind.**

IMPORTED PERCHERON STALLION.

Black; weight 1700; 12 years old; sound. Price $500, or will trade. His colts took first premium at county colt show. I am going to quit. **J. E. Westlake, Moberly, Randolph County, Mo. Rte. 4.**

Black Percheron Stallion

for sale. Comet 78428; foaled May 3, 1910. This is a show colt, a line bred Brilliant. **A. C. Boyd, Joliet, Will County, Ill. Rte. 3.**

FOUR STALLIONS

For sale cheap. One imported Percheron, one high grade Percheron, one high grade Belgian. All No. 1 breeders. Also the standard bred trotting stallion, Arena 16105; trotting race record 2:11¾; sire of Budd 2:10¼, Giberette 2:16¼, etc. These stallions are sold for no fault—too many of their fillies here. **Ed Dorland, Humboldt, Richardson County, Neb.**

IMPORTED BELGIAN STALLION

For sale; 6 years old; sure breeder. Colts to show. **Chas. Snyder, Argyle, Custer County, S. D.**

FOR SALE 300

200 Percheron stallions;

100 Percheron mares;

all ages and prices (50 herd headers.)

Singmaster & Sons, Keota, Keokuk County, Ia.

IMPORTED BELGIAN

For Sale or Exchange.

One imported Belgian; color, chestnut; 12 years old; weighs 1900 pounds; 16½ hands high. Our reason for selling is that his fillies are in his way. Will sell this horse reasonable, or exchange him for another. **Sauer Bros., Sanborn, N. D., R. F. D. 2, Box 39.**

STALLIONS FOR SALE.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Am offering these stallions because I have adopted the capsule system and have them to spare. **Henry Dreher, Cedar Rapids, Boone County, Neb.**

SEE OUR STALLIONS

BEFORE YOU BUY.

Percheron, Belgian and German Coach.

Our last importation arrived December 28. These with the select lot on hand enable us to offer for inspection at this time a great collection of stallions of strong individuality, rare quality and standard breed types. **There are yours at bed rock prices. OUR GUARANTEE is different to that offered by any other firm.** It will pay you to investigate it if you contemplate the purchase of a stallion.

Mention American Breeder when you write.

OLTMANNS BROS., Watseka, Ill.
Leer, Germany; N. Ft. Worth, Texas.

PERCHERON, BELGIAN AND SHIRE STALLIONS

Imported and American Bred.

We have a fine lot of stallions with plenty of bone and weighing from 1,800 to 2,400 pounds each; 3 to 5 years old; good colors; good terms; good safe breeding guarantee, and a square deal.

Some extra good mares weighing from 1,800 to 2,100 pounds each, and in foal; 3 to 6 years old. Prices reasonable. See us before you buy. It won't take long or cost much. We can save you money. Barns in town.

JUNKENS & O'NEIL, 15 North Hazel St., DANVILLE, ILL.

THE GRAND CHAMPION

HARCOURT

The only HORSE that was ever awarded First Premium three different years at the Ohio State Fair. Also winner of First Premium at the following State Fairs and Expositions: Indiana, Illinois, Wisconsin and Minnesota, also the International.

Stallions and mares for sale at all times.

LONZO McCLAIN & SONS

LIMA, Allen County; OHIO

W. A. LANG & CO.

Greeley, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS and MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible, and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars. Send for our large CALENDAR, mentioning this paper.

WHITE OAK STOCK FARM

American bred Percheron Stallions and Mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to **D. Augstin, Carlock, Ill. R. F. D. No. 2.**

Carlock is on the L. E. & W. Ry., and thirty miles southeast of Peoria, ten miles northwest of Bloomington, Illinois.

CLOSING OUT SALE

OF BREEDING STOCK

that I have been keeping for public service and will now sell at a bargain.

9 Stallions and 2 Jacks

One aged Percheron (Imported), weighing a ton, and a 2-year-old weighing 1,600 pounds.

Two are German Coachers, one from sire and dam that are both World's Fair Champions and one a great show horse himself. They weigh 1,400 and 1,500 pounds.

One extra fine Standardbred 4-year-old; 15½ hands; 1,100 pounds.

One fine Morgan; 5 years; 15½ hands; 1,250 pounds.

One fine combination horse; 9 years; 15¾ hands; 1,300 pounds.

Two high grade Percherons, 4 and 6 years; 1,600 and 1,700 pounds

For prices and particulars address

P. O. Box 237, Kinmundy, Marion County, Ill.

BELL'S HORSES

ANNOUNCEMENT

JANUARY 15, 1913

Finds us in possession of more good Percheron and Belgian draft stallions than we ever owned at this season of the year. Intending buyers should come and see them now.

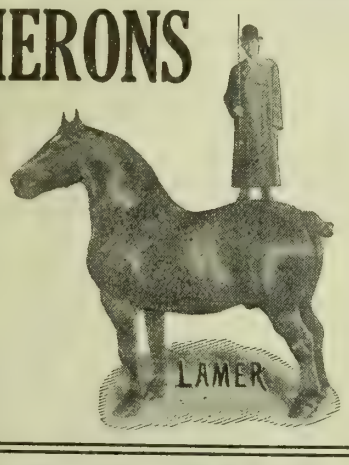
MR. STALLION BUYER

Anywhere—U. S. A. or Canada



Do you want to save money on the next stallion you buy? Of course your answer will be—Yes. Then you will have to buy a ticket direct to HUNTINGTON, INDIANA, the place where you can get what you want at a surprisingly low price. Our new customers say, "If I had only come to your place last summer, I could have saved a great deal of money." Our old customers say, "SOUERS has saved me several hundred dollars and has always treated me the very best." You need not take our word, come to our barns and see for yourself. Get our prices and compare with other importers.

Blue Mound, Kansas

Importers of Belgian and Percheron Stallions and Mares of all Ages and Prize Winners in Both Europe and America.

FIFTY HEAD IN OUR BARNS.

The Last Importation Arrived December 28, 1912.

The **fifty head** are as good as can be found on **either side of the water.** We have a buying partner in Europe who has a large breeding farm and some of our best horses are bred on this farm. **He buys in the dull season,** and buys everything young and sound. **We can sell a better horse for less money** than those not favored with this advantage, as we are the **only ones** connected with a **breeding farm in Europe.** Any one wanting either Stallion or Mare will find it to his advantage to visit our stables. We price them to sell, not to invoice. A good guarantee goes with every sale. Reference, any Bank in Linn County.

W. H. BAYLESS-DERO & CO., BLUE VALLEY STOCK FARM, BLUE MOUND, LINN COUNTY, KANSAS.

(Two Railroads, eight trains per day.)

SKOOG, REED & DeCOW

Imported Percheron, Belgian and Shire Stallions, 3 to 5 Years Old and Well Acclimated and Ready for Business.

Also several yearling and two-year-old Belgian stallions, sired by our herd horse, Clarion D'Appel, that weighs 2400 pounds and from dams weighing over 2100.

Also several good jacks.

Come and see our horses if you wish to buy something good.

SKOOG, REED & DeCOW

HOLDREGE, NEB.

IMPORTED PERCHERONS AND BELGIANS

I have a lot of the best specimens of the two leading breeds. I have personally selected them carefully for big bone, with quality, style, action and breeding, with weight from 1800 to 2200 pounds. I give a gilt edge guarantee, good for two years, with every horse. I am going to sell them down very cheap, considering the quality. Barns are four blocks from A. T. & S. F. depot.

W. H. RICHARDS, D. V. S.

EMPORIA, KANSAS

IMPORTED PERCHERON AND BELGIAN STALLIONS AND MARES

Also Home-Bred Stallions.

I think it is better to have extra good stallions to show when customers come to see, than it is to claim you have them and cannot show. If interested, write or come and see me.

LEW W. COCHRAN, Office 205 Ben Hur Bldg., Crawfordsville, Ind.

Registered Percheron Stallion

For sale, if taken before the first of March, 1913. Two years old; weight 1700 pounds; color, black; star; has good disposition and is well broke to work. This colt is of the low down, wide out type. You seldom find as much bone and quality in the same horse. He is extra well bred. His dam is an imported mare; can show you his sire and other pure bred colts by his sire. If you want a stallion to head a herd of pure bred mares, you can't do better than to come and look at this colt. He was bred to a few mares last season and about 80 per cent are showing with foal. For particulars, write **F. H. Taylor, Sedgwick, Harvey County, Kas., R. F. D. 4, Box 38.**

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

REGISTERED DRAFT STALLIONS AND MARES

for sale; mostly Percherons. Also road stallions, mares and colts at prices to suit your pocketbook and full value; can furnish most anything you want. **E. P. REGISTERED DRAFT STALLIONS

and mares, coming 3 to 5 years. These are good colts of the draft type.

One 11 year blue jack, cheap.

W. L. Lake, Ft. Cobb, Caddo County, Okla.

A PLAN TO DIVIDE THE RISK.

(Continued from page 11.)

I am in a good place to collect. Have a lot of good customers, but this is my objection to the stand and suck way of breeding: Many mares never will breed; many lose their colts; some die. There are a very few that won't pay anything. Now when a horse makes a service on a mare there is just one service less in that horse. The mare owner has received a part of your money that you paid for the horse, as much as if you would buy a binder and cut his grain, if your horse is getting foals for other mares. If he has a brood mare he will get a foal; if his mare is at fault, that is no fault of your horse. You risk one-half of the price when you know your horse is a breeder; is it unfair for the mare owner to risk the other half of the price when he knows his mare is a doubtful breeder or hard to get in foal?

I stand one horse that cost $2,000. He is six years old and when he has served mares that were breeders, has produced good colts. Several breeders came and bred mares to him and said: "I have tried everything else; he is young and might get her in foal; I will try him." He did not get them in foal; I lost the service the same as other good horses had done. He got lots of such mares and now they say he is not sure; still he has lots of mares in foal. Every man that bred to him got part of my investment. Is that fair? I expect to get all the stallion owners in this part of the country on this paper.—John Chadd, Republic County, Kansas.

IT'S THE TRANSIENT MARE YOU LOSE ON.

To the American Breeder: As I have had thirty-five years in the stallion and jack business, I will write a few lines on the subject of collecting service fees, and would like to hear from others along this line. I never have any trouble in collecting service fees on mares that are kept in the country and not traded. I believe I have collected over 95 per cent of the fees on this class of mares, while I believe I have lost 75 per cent of the fees due from the trading class of mares.

Some men will come and breed a mare, who were never known to have anything outside of a wife and several children, except this mare, a mother-in-law, a gun and a dog. They will go off, trade the mare, tell the man that he trades the mare with that she is in foal by a good horse or jack "over yonder." He will go back to the stallion owner and tell him that there is not a colt in her hide. The mare trades around and by the time comes that she is due to foal, she is out of the country and gone, consequently the stallion owner loses his fee. If I understand the Missouri law on collecting service fees, stallion and jack owners have no lien on the mare but hold a lien on the colt until it is 1 year old. If not collected before the colt is 1 year old, then he no longer has a lien on the colt. Now what I would like to have is a law to give the stallion and jack owners a lien on the mare, as well as on the colt, from the time she is bred until the service fee is paid, or until she is known not to be in foal; or make it a penalty for a man to trade a mare after she is bred before this fee is paid, the same as it is under a mortgage. L. A. Johnston, Stone County, Missouri.

To the American Breeder: I have a suggestion which I believe would be a benefit to both stallioner and mare owner; that is, to have all doubtful mares examined by a qualified veterinarian for a reasonable compensation, mare owners to pay for same. And when colts are paid for (say 30 days after colt is foaled) that stallioner deduct the veterinary fee out of the service fee. Let us hear from others.—W. H. Reid, Van Wert Co., O.

DISPERSION SALE

35 Percherons, Pure Bred and High-Grade, 3 Jacks, 1 Standard Bred Stallion and Our Entire Plant, Land, Buildings and Equipment

Neal, Kansas, February 15

The Percherons Include: 5 stallions headed by the imported horse Tatius (45938) 29483; a 3-year-old, weight 1600; a 2-year-old, weight 1500; a yearling, black, weight 1500, and a weanling, black, weight 1000.

25 Mares—1 span imported Percherons, 6 and 7 years, weight two tons; 1 span three-quarter blood black Percherons, 3 and 5 years, weight 2800 pounds, bred to Imp. Tatius; 1 span black three-quarter blood Percherons, 5 and 6 years, weight 3000, bred to Tatius; 1 span gray ¾-blood Percheron, weight 3100, bred to Tatius; 12 other grade Percheron mares, 5 to 9 years old, all bred to imported horses.

The jacks are good ones; 4 to 7 years old; 900 to 1100 pounds; one of them cost $1000.

The roadster stallion is standard and registered; bay; weight nearly 1200; a good combination horse.

Tatius the Old Stallion is a great horse and a great breeder. His colts of all ages will be there to show. He is strongly Brilliant bred, as are all the Percherons.

The Plant is a good one, well equipped (21 lots, barns and dwelling house) and will go to the highest bidder. This is a good locality and our business has been a money maker all the time. Am selling only on account of health.

Write us for complete sale list of stock.

MULE AND JACK IMPROVEMENT

(Continued from page 4).

It was decided that a jack registry was necessary and that someone must start it who had enough prestige to make it a success, and that the rules must require animals to have a reasonable height, a reasonable heart girth and a reasonable bone measurement. Frank B. Graham conducted these records until a few weeks ago, giving to the jack breeders over four years of his time, for which he never received a dollar. One dollar per head was charged for registering; this did not pay the running expenses, but he knew that a record of this kind was necessary; that the breeders needed such a record, and he never hesitated at time or expense to give them his assistance. It was the intention to incorporate this registry about the first of January, 1911, but the Bureau of Animal Industry at that time withdrew its recognition from all American record associations, so the record was not incorporated until September 20, 1912.

We are proud to state that this is the largest jack registry in the world and the most authentic; every application is sworn to and the results are very satisfactory. But there is one thing that we are proud of, and that is that Frank B. Graham has had the confidence of the American breeders to the extent that this record has made the largest growth in the same length of time of any recognized association in America conducted by one man. This is a distinction for any man to be proud of.

A few months ago notices were sent out to the jack breeders who had patronized this association, announcing to them that it was necessary for a record association to be incorporated, so that in case of death the records would be continued without interference, and asked the breeders to name their choice of officers. Thirteen directors have been chosen, and several state vice presidents have been named; others will be named later. The jack breeders have made a good selection of officers. They have selected jack breeders, who are actually engaged in producing this class of stock, and the officers in this association own, at the present time, about 1,000 of the best jennets in America. There are not many other record associations that can advertise a similar fact.

These men are engaged in this proposition because they see the necessity for it. All other classes of live stock have reliable record associations and our advice to every jack breeder is to join this association, which can be made one of the biggest and most substantial of all associations in America. It has the material with which to work—and it will only be a few years until the jack buyers, who actually use this stock, will require these animals to be recorded with the Standard Jack and Jennet Registry of America, because it is founded on solid principles. It has for officers men who are actually engaged with them; they have confidence in them. These officers are located all over the country; they have their friends and horse customers as followers, and with the assistance of the American Breeder, the only jack and mule publication in the world, it is bound to grow and prosper.

In selecting the secretary, William E. Morton, a very wise choice was made. Mr. Morton is a young man with an excellent education; a good bookkeeper and very accurate. We feel that the records of this association are in safe hands and those who expect to register jacks and jennets should send for application blanks immediately and get their stock recorded. The rules now give every breeder a fair chance to record his meritorious animals, but we understand that stricter rules will go into effect in the very near future. There are probably some who are of the opinion that it is not necessary to register jacks and jennets, but we want to go on record as saying right now that this is the time for everyone interested to get their stock in while it is possible. In all classes of live stock registered animals are worth much more than those not registered. For a very small sum and a little time good stock can be placed on record so that in the future when registered stock is wanted it will be easily supplied. The registry fee is $2 for non-members; $1 for members. A membership costs $10. This makes it possible for a member to continue to register his animals for all time to come at $1 each. Breeders having several head, or those who expect to stay in the business, should take out a membership.

As a result of patterning after the law of a state where little is known about the jack and mule business, several state laws do not recognize the Standard Jack and Jennet Registry of America. This state is Wisconsin, where jacks are a curiosity in many localities. A few other states of little importance to the jack breeding industry have copied this law. Every law not recognizing the Standard Jack and Jennet Registry of America is in our opinion unconstitutional. Those having any difficulty with their registry

I Never Had Such a Deluge of Letters

To the American Breeder:—Please discontinue my ad. I never had such a deluge of letters of inquiry in all the advertising I have ever done in my life, and I have done some before. I have letters from eight states to date. I have about 40 inquiries. Please state in your next issue that it is impossible for me to answer all of them and I expect another bunch of letters tomorrow. I expect to dispose of my colts inside of another week. Your paper certainly delivers the goods. Enclosed is check for ad and paper.—Gus Aaron, Leavenworth County, Kas.

ON FEBRUARY 25

40 Good, Big, Rugged, Heavy-Boned Jacks and Jennets

Will Be Sold at

PUBLIC SALE, STERLING, KAN.

Pharoah, Grand Champion at Tennessee State Fair in 1910.

CLOSING OUT SALE

of

JACKS and JENNETS

at

E. G. DAVIS & SON'S BARN

Columbia, Mo.

Thursday, Feb. 6, 1913

40 HEAD

25 Jacks, old enough for service, 15 Jennets

Everything registered, 15 to 16 hands high, 2 to 6 years old. These Jacks are the tops of three states. They were bought at weaning time and several of them cost over $500.00 a head at 5 months old. There are some herd headers in this bunch, good enough to head any herd. As this is a closing out sale everything will be sold without reserve or by bid. You will find more jacks in this sale with 9 to 9½ inch bone than you ever saw in a sale of this size. For catalogue or for other information, address

A. E. LIMERICK & SON or W. E. BRADFORD

Columbia, Missouri

RAISED ON MARES

Young jacks for sale, that were raised on brood mares—a great plan for getting mule jacks that are quick workers.

I want a good Percheron brood mare. Will trade jennets or jack stock.

Stanley Turner, Water Valley, Texas.

DEER PARK BREEDING STABLE.

Has for sale stallions, jacks and jennets. Percherons, Shires, Trotters and Saddlers of the best kind. All registered. Jacks of the good kind from six months old to seven years old; all blacks with white points, and some as good as grows. Am going to close out. Sell the good seed at bargain prices. So come if you want good stuff at a bargain. **Sappington & Brockman, Centralia, Boone County, Mo.**

THREE JACKS FOR SALE.

One registered jack, 16 hands high; black with white points; extra heavy bone; good feet; good head and ears; foaled June 16, 1908. One brown jack; 15 hands high; heavy bone and body; good head and ear; foaled Sept. 4, 1909. One black jack; 15.3 hands high; extra good breeder—jennet jack—foaled in 1903. Will sell cheap or exchange for draft stallion. **W. W. Downing, Hawk Point, Lincoln County, Mo.**

REPUBLIC COUNTY JACK FARM

Three good jacks coming 3 years old, for sale, including two that are extra good. Will pay car fare if they are not.

T. E. Collins & Son, Belleville, Republic Co., Kansas.

A $1,000 JACK TO TRADE

A big, full made black jack with white points; 15 hands standard; six years old, for two good young draft mares in foal. Clydesdale preferred. Tell it all in first letter. **Enos Hayes, Elizabethtown, Hamilton County, Ohio.**

JACKS AND JENNETS.

Three jennets; two with colts by side; ages five, seven and nine; one jack colt; one jennet colt; two one year old past jack colts. Will sell cheap. **O. J. Wilkins, Piggott, Clay County, Ark. Rte. 1.**

EXTRA GOOD HERD JACK

for sale; seven years old; weighs 1125 pounds; serves well on mares and jennets. Also two year old jacks and jennets as large as they grow anywhere. I guarantee them to be right. Come and see them. **Henry Obermann, Freistatt, Lawrence County, Mo.**

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. HUCKSTEP, Eolia, Pike County, Mo.

REGISTERED JACK

for sale; black; seven years old; 15 hands high; weight 900 pounds; sound and sure. Have colts to show. Have more stock than I can handle. The first $500 gets him or will trade for young mules or cattle. J. T. TAYLOR, FOLEY, Lincoln County, Mo.

JACKS AND PERCHERON STALLIONS

Best lot of jacks ever offered at Quiet Glenn; the big kind with herd headers among them a specialty. Buy this fall, get choice and save money. — G. M. SCOTT, Rea, Andrew County, Mo.

---

certificates should correspond with the secretary of this record association. We understand that test cases will be made in the near future, so that breeders need not fear these unconstitutional restrictions. The officers in this association are men of means and the leading jack breeders of the country and can be depended upon to see that the business in which they are engaged gets a square deal.

The directors selected for this association are:

T. E. Collins, Belleville, Kas.
H. L. Duvenick, California, Mo.
S. L. Green, Celeste, Tex.
Tuck Hill, McKinney, Tex.
H. T. Hineman, Dighton, Kas.
S. W. Jetton, Murfreesboro, Tenn.
W. E. Morton, Kansas City, Mo.
C. F. Rice, Indianola, Ill.
U. G. Saunders, Flemingsburg, Ky.
J. H. Smith, Kingfisher, Ok.
B. F. Swaggart, Lexington, Ore.
Lester Swink, Rocky Ford, Col.
J. T Watson, New London, Mo

Following are the rules of entry for this association:

1. Pedigree must give name, color, sex, year foaled in, and name and address of owner.
2. Jacks must measure 58 inches or more from the highest central part of the withers to the ground and measure 62 inches or more around the heart girth in average condition, and have 7 inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size.)
3. Jennets must measure 56 inches or more from the highest central part of the withers to the ground, and measure 60 inches or more around the heart girth in average condition, and have 6¾ inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
4. Any color admitted, provided they comply with Rules 2 and 3.
5. Young undeveloped jacks and jennets may be registered when their sire and dam are registered in this registry, provided the sire fills the above measurements. This will make a uniform type.
6. Each application must give exact measurements of foundation stock, so the certificate cannot be handed out with another animal.
7. Each application must be sworn to before a notary public or justice of the peace.
8. You can give the sire and dam names (barn names) for foundation stock.
9. This registry will not recognize any other jack registry unless the animal meets the requirements of this registry.
10. The fee for registering jacks and jennets in the Standard Jack and Jennet Registry of America shall be one dollar to stockholders and two dollars to non-stockholders for each animal registered. The fee for transfers shall be one dollar for each animal transferred. The fee in all cases to accompany the application. Each transfer shall be recorded before the offspring can be registered.

Note—We are now registering jacks and jennets that fill certain requirements as foundation stock, and it is not necessary to have the sire and dam registered or their ancestry traced, provided the animal fills the requirements of this registry as given in the rules of entry.

Each stud book will have a standard sire list, showing the exact measurements and colors of all sires. These stud books will be sold cheap so that everyone interested can own one and know the qualities of the sires. For the advancement of a breed it is necessary to use good sires.

For blanks, or any other information, address William E. Morton, secretary, 418 N. Y. Life Building, Kansas City, Missouri.

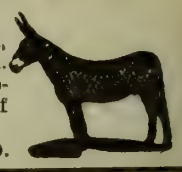
GET WHAT YOUR JACK SERVICE IS WORTH.

To the American Breeder: We wish to commend your article of a short time ago in which you advocate better jacks and higher service fees for the same. The jack men must wake up and look around or they will lose what belongs to them. The jack men and the people generally do not seem to realize that the size and price of jacks have doubled in the last few years. The days of the little jacks that looked like billy goats are gone forever. Jacks used to be stood for $10, but we must raise the price to $15 or $20. You positively cannot stand a $1,000 jack for $10 or $12.50—not a cent less than $15 and make your share. Just think, good mule colts will sell higher, on an average, than most any stock you can raise. A carload of the best weanling mules within 15 miles of our home, would cost you on an average of $125 right now, and we are quite sure that there is not six horse or mare colts here that would bring over $100.

We are the first people that ever stood a jack in this county for $15. We can't get business for a $15 jack if there is a $10 jack around. We have firms here that ship out mules by the hundreds every year. One firm sold $27,000 worth of mules to one man at one sale, a short time ago. We had a commercial club sale here a week ago and sold one sorrel two year old mule for $300; a blue two year old for $290 and a lot of them for $500 and $550 a span. Nothing else sells like good mules. Now you jack men surely do deserve your part of this profit and you will get it if you will only ask it. Don't allow anybody to stand a $350 horse higher than you stand your $1,000 jack. Bradley Bros., Johnson County, Mo.

SUCCESS WITH JACK AND STALLION.

To the American Breeder:—I feel that it is the duty of we stallion and jack owners to contribute a few words for the January 20 issue. I am not in the business very extensively, but am interested in the bettering of the stock in Missouri.



I have a splendid jack, six years old last month. I stood him for two years without the help of a horse and had very good success with him with the use of an impregnator. But I thought that doing his own teasing was having a tendency to make him a little slow, so last spring I purchased an imported Percheron horse, twelve years old, but a good breeder with good blood in him. I found it much more satisfactory work to try the mares with an experienced horse that was easily handled, besides I took care of 70 mares with this horse. I found too, that when I quit using my jack as a teaser, that I never had to wait over 10 minutes for him, generally about 5 minutes.

I have a two-acre lot or pasture with running water in one corner. The horse runs in this during the day, winter and summer, his stable door opening into the lot so that he can go in for shelter. In the evening at feeding time the horse is put up and the jack's stable door opened into this lot, so that each of them have half of the time for exercise. I have been

---

HOME OF THE GIANTS.

75 Jacks and Jennets 75

All black; all registered. The big boned, big footed, heavy weighing kind. All from 15 to 15 1-3 standard. All ages up to six years. Every one guaranteed as represented. Main line Missouri Pacific; 65 miles east of Kansas City. Offices in town.

BRADLEY BROS., WARRENSBURG, MO.

Missouri Registered Mammoth Jacks AND JENNETS

FOR SALE AT ALL TIMES.

As fine a bunch as can be found on one farm. Guaranteed as represented. Prices that are bargains. Come and see them.

J. T. Watson, New London, Ralls County, Mo.

in exchange for land, second county west of Oklahoma in Texas on R. I. Railroad. 100 acres broken, part in wheat. Worth $2,500. Describe stock and price in first letter. **Dr. F. W. Roach, Anthony, Harper County, Kas.**

ONE MAMMOTH JACK

for sale; 16 hands high; 5 years old. **Also One Registered Belgian Mare,** 7 years old; imported; weight, 1700 pounds. **M. J. Ragan, Stockton, Kas.**

I'll Make Any Man Able

to buy my two registered stallions and one registered jack. A bargain for you. This stock is sound and sure. Will sell regardless of their worth as I must give my time to my hogs. **Wilder Carpenter, Grandview Breeding Farm, Marmaduke, Ark.**

BREEDING STOCK

for sale. One black jack; 14½ hands high; one grade Percheron stallion; weight 1600; both 8 years old. Colts to show from both. Stock guaranteed as represented. **Floyd R. Reed, Hull, Pike County, Ill.**

JACK WANTED.

I want to exchange a gray Percheron four years old. Registered in the Percheron Society of America, for a good young jack, not to weigh less than 1,000 pounds. **Mathys Bros., Onawa, Monona County, Iowa. Rte. 1.**

working the horse this winter some to the plow. I use him as the third horse with a jockey stick to keep him from bothering the mares. I do this, not that I need his work, but I believe that a stallion should have some work in the harness. I want to take up the capsule system next season.—T. H. Loy, Lawrence County, Missouri.

RAISING JACKS ON MARES.

To the American Breeder:—I read with approval your article on the house cleaning of the Percheron Horse Society, and think with you that no officer with the least suspicion against him should remain in office. In fact, if he were an honest man he should have at once resigned. However, I want to congratulate you on your stand in the matter.

Some years ago one of the jack registrations needed the same thing, but I hope they have reformed themselves since then. I noticed, however, that the Department of Agriculture withdrew its recognition. In my last letter did I tell you that we are now successfully raising jacks on mares? I have a colt, full brother to first prize jack at San Antonio International, being raised on a mare, and I have never seen any colt make a better growth; the mare runs on the range and comes up for feed. This colt will never know that he is a jack and will serve mares naturally, on the range. I expect the mare to carry him until next fall, and after one winter's feed he will be ready for service.

I have had some 25 years with ranch life and have seen many changes. We need more intelligent care of stock. I think amateur quack doctors kill lots of animals with remedies, when if left alone the stock would have recovered. All stock (dead) should be burned up, of course, if death is suspicious, to prevent further infection. Worn out stock should be mercifully destroyed and not allowed to starve and die a thousand deaths. Worn out horses make good hog and dog feed and their hides more than pay for skinning. In the interest of the horse, stock papers should advocate good roads—of width that can be kept good—wide tires with an axle that will keep out the dust and hold the oil. Thousands of horses are worn out, not with the load but simply because the axle is full of sand instead of grease. There is a simple remedy for this which would save untold labor to the poor beast. The American axle is a disgrace to civilization; it is nothing more nor less than a horse killer.—Stanley Turner, Tom Green county, Texas.

REMEDY FOR JACK SORES.

To the American Breeder:—I saw a piece in the paper of Mr. Smallwood of Missouri wanting a remedy for jack sores. I have a jack that had sores on his legs for a year and I tried everything that I could hear of, but nothing would help him. At last I commenced using slacked lime. I would throw some ime on the sore three or four times a day and in the course of a week, I could see some improvement, and in a short time he was sound and well. Try it.—Texas Subscriber.

OF COURSE HE'S NOT FOR SALE.

To the American Breeder:—I have an imported Spanish jack, registered as Fraigillo, foaled 1900, black with light points, 15¾ hands standard, 16½ hands jack measurement, weight 1,250 pounds, girth 70 inches, flank 70 inches, arm 19½ inches, knee 16 inches, smallest below knee 9 inches, hock 18½ inches, below hock 10½ inches. He will do his own teasing and as quick to serve a mare as any stallion. He is sure and an extra good breeder. Have any of the readers of the American Breeder got one that is his equal in every respect? If so we would be glad to hear from them.—D. A. Sprague, Clark County, Ohio.

FOUR-BOARD FENCE FOR PADDOCK.

To the American Breeder:—Take good heavy fence posts, eight feet long, set in the ground three feet deep, seven feet apart, then use oak fence boards, 1x6 inches and 14 feet long. Nail the top board 5 feet from the ground, the second eight inches below and the third seven inches below, with the fourth six inches; this brings the bottom board 15 inches from the ground and that is all that is necessary. I have used two paddocks of about one acre each with only three pine boards for fifteen years for standard bred stallions, Percheron stallions and jacks and have never had any trouble. Have very often had mules running on the opposite side of the paddock fence. Never make a tight fence around a paddock, as it will make a stallion more vicious and unruly and like a wild animal. They are very intelligent and human like and therefore want to see all that is going on around them and they will be much more contented if they are allowed to do so.—D. A. Sprague, Clark County, Ohio.

ADVISES STARTING LATE WITH CAPSULES.

To the American Breeder:—As I had a chance I thought this suggestion might be some benefit to some beginners in the capsule system. Do not begin until the first of May, because you can breed all the mares in the neighborhood in plenty of time, and above all keep the temperature right and you can not be too clean and careful.—N. S. Cox, Daviess County, Missouri.

WHAT OF THE BIG JACK COLTS?

To the American Breeder:—Last year, through your valuable paper, we had several reports from different parties about large jack colts. Some were 15 hands high at one year old, one that had to be tailed in getting up. Would like to know if buzzards have not pulled his tail before now. Please ask those parties to report again how those large colts have done.—G. B. Reagor, Bedford County, Tennessee.

MULE NEWS FROM MISSOURI.

A special train consisting of 15 new Wabash 40-foot stock cars containing 409 cotton mules, costing $100,225, from Cottingham Bros., Kansas City; bought and consigned to C. L. Bevill, Fayetteville, N. C., were handled by the Wabash from Kansas City to St. Louis.—Moberly (Mo.) Monitor.

J. E. Moore, of Guthrie, made the purchase last week of a lot of big mules. He bought three from W. W. Rauschelbach for $800, two from J. R. Ferguson for $530, two from J. L. Bell for $500, two from George Dickson for $460 and two from Herman Baurichter for $425. Mr. Moore shipped a car load from Guthrie Monday.—Cedar City (Mo.) Chronicle-Reporter.

All records in fat mule sales in Callaway County were broken last week, when buyers representing two East St. Louis commission firms bought 780 head for $16,338.75, or within a few cents of $212 apiece. The largest buyers were Guyton & Harrington, who got 505 head at a cost of $110,138.75. The other buyer was Howard Bailey. The mules were shipped Friday on a special train of twenty cars. Eighteen of the cars were loaded at McCreedie and two at Auxvasse. The shipment was the largest ever made in the history of the county, and probably never before did one firm buy and ship a train load of mules out of the county. The shipment also probably represented more money than any live stock shipment ever made out of the Kingdom.—Fulton (Mo.) Gazette.

ADVERTISING BRIEFS

H. W. Bowman, Mount Carroll, Ill., is advertising in this issue a Percheron stallion to trade for another equally as good. If interested, don't fail to read his ad.

Geo. Hurley of Chickasha, Okla., would like to get a good draft stallion and a jack to work on shares. Anyone having such stock might find it of interest to correspond with him.

L. D. Norris of Redding, Ia., has an imported French Coach stallion advertised in this issue to trade. Don't fail to look up the ad.

A Shire stallion is advertised for sale in this issue by Dr. G. C. Dunham of Kempton, Ind.

J. H. Smith, proprietor of the Kingfisher Valley Jack Farm at Kingfisher, Okla., is advertising fifty registered jacks for sale. Read his advertisement in this issue.

One of the advantages which Oltmanns Bros. of Watseka, Ill., have in their draft and coach horse business is the ownership of a big breeding farm in Germany where the best stock is bred and good colt values are purchased in dull times and developed for exportation. The Oltmanns' farm at Leer, Germany, is famous for its draft and coach horses, and Holstein-Friesian cattle. See the advertisement of Oltmanns Bros. in this issue.

160 acre stock ranch with breeding barn in connection is advertised for sale in this issue by J. F. Kistler, Delta, Colo. Look up the ad.

Chas. Snyder of Argyle, Colo., has an imported Belgian stallion advertised in this issue. If in need of such a stallion look up the ad and then write him.

John L. Oliver of Tuttle, Okla., has a jack to trade and asks our readers what they have. See his ad in this issue.

Four stallions are advertised for sale cheap by Ed Dorland of Humboldt, Neb. Read what the ad says and then write him for full particulars.

If you have horses, cattle or mules that you would like to exchange for a Percheron stallion, look up the ad in this issue of E. H. Parvin, Kidderville, Kas., and write him.

Fred French of Boonville, Ind., has some good stock advertised for sale or trade for cattle or mares. Don't fail to read his ad if you are interested.

Anyone on the look-out for a farm should not fail to read the advertisement in this issue of Chas. A. Galt, Mound City, Kas. He has a farm of 100 acres for sale and will take stock as part payment.

There are always bargains to be had at a closing out sale of breeding stock. Such a sale is to be held at Kinmundy, Ill. See the ad in this issue and write for particulars to P. O. Box 237.

U. G. Saunders, the well known breeder of jacks and jennets at Flemingsburg, Ky., starts his ad in this issue. Mr. Saunders raises all his own stock and sells them worth the money.

HILLSDALE STOCK FARM,
De Sota, Jefferson County, Mo.

We wish to announce that we have serviceable jacks from 14.1 to 15.3½ standard. Jacks that have weighed 1150 priced from $450 to $1100. Also such saddle horses as High Chief 2211, who has defeated second prize horse at World's Fair. 1200 pound horse at $600. Colts, mares, fillies and jennets in foal; ones that produced jack colts this year. We can also sell jennets in carload lots.

Would exchange jack for registered Percheron stallion not over 10 years of age.

We guarantee to be as represented. Buy and sell on commission. Our knowledge, your gain. **Oscar Edwards & Son, De Sota, Mo.**

Stallions and Jacks

for sale. Two extra good jacks and two fine stallions. Jacks both black with white points; 15½ and 16 hands; big bone and large head and ears; good breeders and sure foal getters.

One imported Percheron draft stallion; 8 years old; weighs 1800 pounds; extra good breeder; good disposition.

One saddle stallion; 3 years old; 16 hands; will weigh about 1100; dark bay; goes all the gaits; a good breeder; will make a show horse. Colts and books to show. Reasons for selling: I am in poor health and not able to take care of them. Priced to sell quick. Reasonable terms.

F. C. Kroll, Lexington, Lafayette Co., Mo. R. F. D. 2.

45 miles east of Kansas City on Lexington branch of Mo. Pac. R. R.

JACKS AND STALLIONS

I can furnish a few extra good registered jacks and jennets, also a few choice draft stallions, for less money than any one. **L. Donaldson, Olney, Lincoln County, Mo.**

Big Black Jack

15½ standard; 16¼ tape measure; heavy bone; extra worker and breeder. Let us show you. **Garee & Garee, Noble, Cleveland County, Okla.**

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. **Scott, Abney & Jenkins, Virden, Macoupin County, Ill.**

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. I raise all my own stock and will sell them worth the money. Write for prices today, or better, come and see them. **U. G. Saunders, Flemingsburg, Ky.**

"THE BIG FOUR."

Black jack with white points; two years old the first of last November; 15 hands standard measure. He has as much length and bone as anybody's jack; fine head and ear; big fine foot and bone. He is by Tax Payer, Jr., and out of a 15-hand jennet. He is big enough and bred good enough to head a herd of anybody's jennets; weigh 900 pounds; will make a 1200 pound jack. For photo and price, address, **W. H. Alexander, Lynnville, Giles County, Tenn. R. F. D. No. 2.**

GOOD, SOUND JACK.

for sale, or will trade for pair of mares. A sure foal getter, guaranteed. Reason for selling; am going out of business. **H. V. Somerville, Route 5, Oxford, Miss.**

TWO JACKS, ONE STALLION.

Sound and sure, good breeders and good business getters, at **Public Sale, Saturday, February 1.**

The jacks are 7 years old; 15 hands, heavy boned, [illegible] with light points. The stallion is a dark dapple gray, 16½ hands, 1600 pounds, shows all the saddle gaits and crosses well on both draft and road mares. Would not sell him but am quitting business. Sale in town.

J. E. Price (Phone 513) **Richmond, Mo.**

40 HEAD

Jacks and jennets. Write us for prices. CORSON BROS., POTTER, ATCHISON COUNTY, KANSAS.

SIX JACK COLTS

For sale. Also two Percheron stallions and five Standard bred stallions. 640 acres devoted to live stock. 22 miles from Kansas City and 28 steam and electric cars each way daily. Make appointment with me by phone or mail.

F. M. Lorimer, Olathe, Kas.

TWO YOUNG JACKS

For sale—my own breeding; 5 and 3 years old; black, with light points. The older one has proven to be an extra good breeder; the younger is not broken; they are 14¾ and 14½ hands high; I have their half brother, older, but no better bred, that is 16½ hands, with 10-inch bone. I guarantee every statement I make.

R.J. Dillon, Spring Hill, Johnson Co. Ks.

JACKS FOR SALE.

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention the American Breeder. **S. W. Jetton & Co., Murfreesboro, Tenn.**

KENTUCKY JACK FARM.

Established in 1884.

A fine lot of black mammoth Kentucky jacks; big bone and plenty of weight. Will sell in carload lots for the next 30 days, at special prices. **Joe E. Wright, Prop., Junction City, Ky.**

OUT OF SEASON PRICE

on 14 jacks and jennets from two to eight years old. In this offering will be my herd jack, Klondike; he is a good one; would not offer him only I must change jacks; have some of his colts old enough to breed. **Geo. T. Poage, Garrison, Christian County, Mo.**

JACKS AND STALLIONS.

Forty-five of the best Mammoth jacks in Kentucky from $300 to $1,000. Registered Percheron stallions from $250 to $750. Write for circular or visit the Cloverdale Farm. **H. T. Brown & Co., Lexington, Ky.**

JACKS AND SADDLERS.

We have a grand lot of big bone, Kentucky Mammoth jacks, from colts to 6 years old. Saddlers, stallions, mares, colts and fillies. Write us your wants or visit the Cook Farms. **J. F. Cook, Lexington, Ky.**

Jack and Morgan Stallion

For sale; black Jack; six years old; 15½ hands high. Sorrel Morgan stallion; 16 hands high; weight 1260 pounds; four years old. Colts to show. Going out of business; will sell at a bargain. Write for particulars. **B. R. Lewis, Coffeen, Montgomery County, Ill.**

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. **Lewis Swink & Son, Rocky Ford, Otero County, Colorado.**

---

100 WEANLING MULES

For sale. The very choicest kind, Mules in town. Also few choice jacks and jennets. No trades. **L. W. Hoyt, Barry, Pike County, Ill.**

KINGFISHER VALLEY JACK FARM.

50 registered, big boned, heavy bodied black jacks and jennets, from colts to 16 hands. Best breeding. Prices and terms right. **J. H. Smith, Kingfisher, Okla., R. 3, Box 17.**

EIGHT GOOD YOUNG JACKS

For sale, from 1 to 4 years old. Could use a good young stallion in exchange. **R. B. Miller, St. Michael, Buffalo County, Neb.**

JACK FOR TRADE.

What have you to trade for a 3-year-old jack; extra sure; good breeder; colts to show. Send for photograph. **John L. Oliver, Tuttle, Okla., Box 164.**

A FEW GOOD JACKS

for sale; two to seven years old; good height, bone and color. **G. H. Minton, Forest City, Holt County, Mo.**

JACK FOR SALE.

Stands 15.3; weight 1100 pounds; 7 years old; large bone; good performer. Sure; warranted sound and right. **A. Calender, New Lyme Station, Ashtabula County, Ohio.**

H. P. Wilkinson & Bros. invite the attention of our readers to their offering of imported Shire and Percheron horses of both sexes. These animals were selected in the old country by H. P. Wilkinson himself. He bought just such horses as he would have selected were they for his own personal use and, as a result, buyers will find on the Wilkinson Farms high-quality

Here is a sample of the letters received from customers by the American Farm Gate Company of Kansas City, Mo.: "During the month of July your company shipped to us on trial two (2) of your 12-foot self-lifting galvanized steel gates. After thoroughly testing these gates we placed an order with you for 100 of the same kind. At the present writing the greater part of these gates are in use, and are giving excellent satisfaction. We have had quite a little experience with the various grades and makes of farm gates on the market, and after thoroughly testing all others, believe that in your gate we have found the ideal gate for our use. You may look for an order from us in the near future covering our requirements for the coming year. Yours very truly, Double U Company, L. H. Fitzhugh, Purchasing Agent, Post City, Tex."

A liniment that makes good so consistently that it will hold customers year after year must possess an abundance of merit. Absorbine is continually making new friends but it also holds the old ones because it does everything that is claimed for it in a mild and pleasant manner. F. B. Loomis, 1052 Richard street, B. C., writes May 22, 1912: "I have been using Absorbine ever since 1892. I started using it the season of 1892 with the mare Nellie Mason that I was racing that year, and have stuck to it ever since. I can't say too much for it and I keep it in the stable all the time."

Al E. Smith of Lawrence, Kas., writes us as follows about the good jacks he advertises regularly in these columns: "I have two-year-olds, and a number of them 15½ to 16 hands standard measure; will mature to 1200; three-year-olds weighing 1100 pounds; 4 and 5 and 6 year olds over 16 hands and weighing over 1200 pounds. Have over forty head of big black Mammoth jacks to choose from. No one is able to show as large a bunch with the bone, breeding style and finish found in these. A number of these are good enough to head any jennet herd. Took all the prizes on jacks and jennets of any age at state fair. I sold eighteen jacks in Missouri last year. My jennets are very large, some over 16 hands. These jacks are bred to breed the large high class mule. It would pay anyone wanting a good one to see these before buying. We raise most of our feed and do most of the work in taking care of this stock, therefore can sell for less money, for we are not at the expense many dealers are. My jack farm is two miles west of Lawrence. Will gladly meet buyers at any time at trains."

R. B. Miller of St. Michael, Neb., has eight young jacks advertised in this issue for sale, or trade for a stallion. Look up the ad.

Two young jacks are advertised for sale in this issue by R. J. Dillon, Spring Hill, Kas. Don't fail to read it.

Louis Knopp of Cole Camp, Mo., has a Percheron stallion advertised for sale in this issue, or will trade for a saddle stallion. He also has a jack for sale. Look for the ad.

Taylor & Jones, of Williamsville, Ill., write us under date of Jan. 7, as follows: "We feel we were never in better position to please parties wanting good Percheron, Belgian or Shire stallions or mares. Our barns are filled with a choice lot of all the draft breeds, both sexes, and we invite inspection. We never had horses do better than ours have done this fall and winter and with our low prices and our very liberal guarantee, we feel we can interest anyone wanting anything in our line. Write for our little booklet, just printed. It has information of interest to horsemen and especially to those who are planning to buy."

J. G. Truman, Mgr. Trumans' Pioneer stud Farm, Bushnell, Ill., writes: "I am pleased to say that the carload of imported Shire, Percheron and Belgian stallions that we had on exhibition at the short course last week held at the Iowa Agricultural College, at Ames, arrived home in first class condition. The exhibit was from start to finish a grand success. The horses were very highly complimented upon by Professor W. H. Pew, the students and the onlookers in general. At the head of the Shires was the International grand champion, "Lockinge Hengist;" the Iowa State Fair grand champion, "Carlton King," three years old; "Lion Heart II," second at International, and the yearling colt, "Carlton Royal Grey," first at the Iowa and Illinois State Fairs and International, 1912. The Percherons were headed by the Minnesota State Fair grand champion, "Karvoi," in his two year old form weighing around 1,900 pounds, and the Belgians were headed by "Emier," two years old, weighing over a ton, a noted prize winner in Belgium, and winner of the gold medal given by the Belgian Society of Belgium at the recent International. Our Mr. W. E. Truman was in charge of the exhibition and reports that greater interest was taken by the students and farmers than he had ever before witnessed, which shows that the draft horse trade and interests are in a flourishing condition."

J. M. Nolan of Paola, Kas., invites inspection of his stock at all times. He has Percheron, Belgians, French draft and Coach stallions from $350 up for sale.

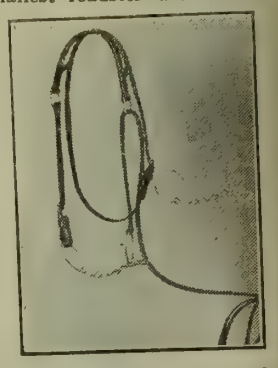
Look up the advertisement in this issue of C. A. Folts, York, Neb. He has a registered Percheron stallion that he offers to sell cheap.

Dr. F. W. Roach of Anthony, Kas., has some land that he wishes to exchange for jacks or stallion. Look up his ad; you may be interested in his proposition.

An imported stallion is advertised in this issue for sale, or trade for grade mares. If in need of a stallion, write for full particulars.

M. J. Ragan, of Stockton, Kas., is advertising a big mammoth jack and Belgian mare for sale in this issue. Look up the ad.

Anyone having a Shorthorn, Polled Durham or Red Polled bull to dispose of, and would like to turn it in as part payment on a Percheron stallion, should look up the advertisement in this issue of E. L. Jones of Forgan, Okla., and write him



Rob't Means of Hersman, Ill., is advertising a good Hackney stallion for sale in this issue; also one Percheron stallion to trade. See his ad.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

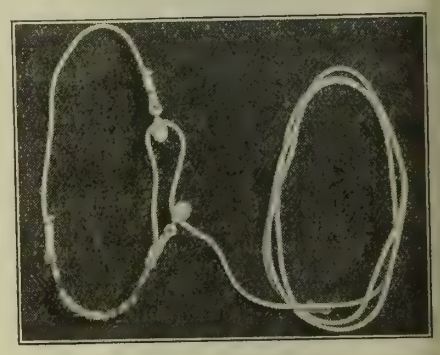
Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."



"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG

Assumption, Christian County, Illinois.

"CONQUEROR" STALLION BRIDLE

GUARANTEED TO HOLD ANY STALLION OR JACK.

This bridle is made of especially selected material, absolutely the best on the market.

F. C. Kroll of Lexington, Mo., is offering his breeding stock consisting of stallions and jacks, for sale at reasonable prices and easy terms, as his health is such that he cannot handle them. Don't fail to read the ad.

If you are in the market for a road stallion, don't fail to read the ad in this issue of Fred Hammer, Coatsburg, Ill.

An imported Percheron stallion is offered for sale or exchange in this issue by Simon Hinchberger, Sanborn, No. Dak.

Five hundred dollars is the price J. E. Westlake, Moberly, Mo., is asking for his imported Percheron stallion. His ad appears in this issue.

If you are in the market for a Percheron stallion, look up the ad in this issue of R. E. Pratt, Shenandoah, Ia. He may have just what you are looking for.

Kentucky Rex 1467, sired by Rex McDonald, is advertised for sale in this issue by O. T. Karr, Quitman, Mo. The price is $500.

L. Donaldson of Olney, Kas., is advertising a few choice stallions, jacks and jennets for sale in this issue. Read the ad.

A. C. Boyd of Joliet, Ill., has his black Percheron stallion, Comet 78428, advertised for sale in this issue. He says this is a show colt. Don't fail to read the ad.

One black jack and a grade Percheron stallion is offered in this issue by Floyd R. Reed, Hull, Ill. If you are in the market, look up his ad, and get in touch with him.

A registered Percheron stallion is advertised for sale in this issue by Earl J. Gossard, Kempton, Ind., for $300. This stallion is sold for no fault, but must change.

Lonzo McClain & Sons of Lima, Ohio, owners of the grand champion stallion, Harcourt, start their ad in this issue. They have stallions and mares for sale at all times and if you are in the market, don't fail to investigate what they have.

Five registered Percheron stallion colts are advertised for sale by H. O. Wyland, Kirkman, Iowa, at prices ranging from $250 to $300. See his ad.

Garee & Garee of Noble, Okla., have a big black jack that they would like to dispose of. Their ad appears in this issue.

Read the new advertisement in thfs issue of Fred Chandler, Chariton, Iowa. He has home-grown Percherons worth the money.

A good grade Percheron stallion is offered in this issue for sale or trade by Wilbur A. Terpening of Galesburg, Ill. Look up the ad.

Look up the advertisement in this issue of W. W. Downing, Hawk Point, Mo., it gives a good description of the three jacks he is offering for sale, or he will exchange them for a draft stallion.

The well known importers, Oltmanns Bros., of Watseka, Ill., start their advertising in this issue. They are advertising their stock at bed rock prices and guarantee every animal. If you are in the market for a stallion, it would undoubtedly pay you to investigate their stock.

J. P. & M. H. Malone of Chase, Kas., invite inspection of their stock. They have Percheron stallions, jacks and jennets for sale, and there is quite a few prize winners among them.

The well known firm of Sappington & Brockman, Centralia, Mo., begin their advertising in this issue. Look up their advertisement, it tells something about what they are offering.

If you are in the market for a jack that has been raised on a brood mare, Stanley Turner, Water Valley, Texas, can supply your needs. Read his ad in this issue.

Scott, Abney & Jenkins of Virden, Ill., start their advertisement in this issue. They have a lot of jacks and mules that they will sell at reasonable prices.

A French draft stallion is offered for sale in this issue by M. P. Lydon, Cresco, Iowa, which he will sell cheap for cash or trade for a good Belgian or Shire. If you are interested, look up his ad and then write for further particulars.

O. J. Wilkins of Piggott, Ark., is offering three jennets and two jack colts cheap. If you are in the market, don't fail to investigate this.

F. D. Maddex of Arcadia, Neb., has 160 acres of hay land that he wishes to sell or trade for pure bred Percheron mares. He prices this land at $20 per acre.

Read the advertisement in this issue of C. F. Rice, Vermillion, Ill. He is offering some good jacks and a German Coach stallion at reasonable prices.

Don't fail to read the advertisement in this issue of J. R. Brooks, Cairo, Mo. He has three draft stallions, five jacks and five Hereford bulls to sell.

A big $1,000 jack is advertised in this issue to trade for two good draft mares in foal, Clydesdales preferred. Anyone having a surplus of mares of this sort would do well to get in touch with Enos Hayes, Elizabethtown, O., the owner of this jack.

Some registered Clydesdales are offered for sale in this issue by Lindley W. Baker, Milton, Ind. If in the market for a Clydesdale, read the ad and then write him.

Henry Obermann of Freistatt, Mo., invites any of our readers interested in jacks and jennets to come and see his stock. He guarantees them to be right. See his ad.

Mathys Bros. of Onawa, Iowa, would like to exchange a Percheron stallion for a good young jack. Read his ad and if you have a jack that you wish to dispose of in this way, write him.

Anyone in the market for Chester White hogs would do well to correspond with C. E. Thompson, Elberfeld, Ind. His advertisement appears regularly in our columns.

W. J. Ford of Princeton, Kas., is offering his property and breeding stock for sale in this issue. The ad tells pretty fully what he has and he will be glad to give further information to anyone interested in this proposition.

T. E. Collins & Son, Prop's, of the Republic County Jack Farm, at Belleville, Kas., start their ad in this issue. They invite inspection of their stock. If you are in the market for a jack or jennet, don't fail to write them.

Bell Bros., Wooster, Ohio, write: "Among the sales made during the past two weeks we are pleased to announce the sale of the International Reserve Champion and first prize Belgian mare, "Sarah de Dottignies," to Mr. Andrew Harp of Van Wert, Ohio. This mare has beyond question, the greatest record of any draft mare imported to America this year, having won first at the West Flanders show in Belgium, first and championship at the Ohio, New York, and Michigan State Fairs, and first at Brockton, Mass., winning over last year's International champion. Messrs. W. E. Weigle & Son, Butler County, Pennsylvania, after inspecting several importing barns, purchased the International tenth prize two year old Percheron stallion, "Komite." Messrs. O. Fish & Son, of Paulding County, Ohio, have purchased the three year old Belgian stallion, "Baccus d'Hulencourt," prize winner at the Ohio, New York, and Michigan State Fairs. W. H. Reed, of Van Wert County, Ohio, gets the gray Percheron stallion, "Hilaire." This stallion, as a three year old, served in the stud of Auguste Tacheau, prominent French breeder, and has been very successful as a sire.

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it.

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.
SPOHN MEDICAL CO.,

Stallion Blankets

Made to Order—Get a Fit

A good, substantial blanket is a necessity for all valuable animals. Our blankets are treated with a preparation to prevent horses from tearing them. In ordering, send measure from top of collar to the tail and heart girth measure. We can fit any horse, jack or mule.

Blankets made of best heavy material, substantially lined. Surcingle material sewed to blanket to prevent tearing. Leather front fastener. Express paid. Price each, $4.00; three blankets for $10.

Kansas City Impregnator Co.

12th and Central Sts. **Kansas City, Mo.**

A GOOD MULE. A GOOD MARE OR GELDING.

If you need one or a trainload we can supply you. We are the largest dealers at the Kansas City horse and mule market and can sell at prices that will suit.

We handle all grades of mules. Have sold mules to every state in the country in the last twenty-five years. Mule and horse departments in charge of recognized experts.

Inspection of our stocks in our three big barns at the Kansas City Stock Yards invited. Students of the Graham Scientific Breeding School, who have visited our barns for lectures on mule and horse types, and readers of the AMERICAN BREEDER particularly welcome.

New HUDSON "37"

Furnished Complete---No Extras to Buy

Which Shall It Be?

Will you prefer an old car, slowly and gradually improved, or a new car built upon the experience of 48 engineers in 97 factories—Such a car is the HUDSON "37."

Two kinds of cars are on the market this year, both of which types should receive your careful consideration.

One has been slowly developed from the models of years ago. It has been improved as improvements have been made in motor car designing. The valves have been enclosed. Self starters have been added; electric lights included; upholstering made deeper; probably the wheel base lengthened. But usually the car is as it was with all of the value and many of the shortcomings of the cars of earlier date.

Refinements have been brought to a high degree in cars of that type. They give good satisfaction. They are dependable up to a certain point. But they lack many of the things that have been learned in motor car building because it has been impossible to incorporate all of the new ideas into the design of other cars.

THIS NEW CAR WITHOUT SUCH FAULTS.

The other type of car is the one that has been designed with a definite purpose of incorporating only the good things that have been learned in the past ten years of motor car building. None of the old faults were included. Simplicity was made possible by this form of construction.

When this car was started, 48 expert engineers, gathered from 97 factories, trained in Germany, Italy, France, England, Belgium and Austria, combined what they knew in the perfection of the one car. It is their four-cylinder masterpiece and is the HUDSON "37."

WORKED UNDER HOWARD E. COFFIN.

These men were guided in their work by Howard E. Coffin, America's foremost automobile engineer. He had built six cars, all of them successes. His work is known to every motorist. His cars have been the stepping stones in automobile development. Under him these 47 engineers were capable of doing greater work because of his inspiration and the rivalry of each man with his associates focusing their experience on one car.

This is the type of car we ask you to see when you investigate the HUDSON "37."

DON'T BUY A CAR BECAUSE OF EQUIPMENT.

Yet the HUDSON "37" is as fully equipped as it is possible to furnish an automobile.

The custom now of fully equipping an automobile is liable to cause some to misjudge values. We can advise against your choosing a motor car because of its equipment for the very reason that HUDSON cars are fully furnished with the best equipment obtainable.

But in other cars you might be deceived as to value. Equipment does not indicate value.

Furnishing a speedometer, demountable rims, windshield, clock, etc., or giving a self-starting device, has no important bearing upon the character of the car. They are desirable on an automobile but they do not affect the power, speed or comfort or the easy riding qualities of the car. They have nothing to do with the stamina of the car. They do not affect the simplicity of the design. They do not guarantee the perfectly operating motor, all of which are more essential to your motor car satisfaction than is the possession of all the equipment that is put on even the highest priced cars.

Electric Self-Cranking—Electrically Lighted

WHAT SHOULD A GOOD CAR COST?

With the cheapest cars giving the best equipment, one is liable to be confused as to what price it is necessary to pay for a good car. The very cheapest cars, of course, are not to be had at a low price. Brains cost money. Materials are costly. Workmanship is an item that even in the larger cars makes it impossible to give a quality that will stand up under all conditions and that will meet every desire of distinction, finish, luxury and safety. In the HUDSON "37" is combined all of these features at the lowest price at which it is possible to furnish them.

See the car. Compare it with any other automobile you have in mind. Up and down in the scale of prices, your conclusion must inevitably be that it has all of the features that the costliest car possesses. And yet the cost is low.

WHAT THESE 48 MEN HAVE DONE.

The HUDSON "37" is electrically self-cranking and electrically lighted. It is fully equipped; has 12-inch upholstery, top, rain vision windshield, a motor which develops 37-43 horsepower, speedometer, clock, 36x4 inch wheels, one 18-inch wheel base, tools and other equipment.

Therefore it has the best quality we know how to produce. Every detail of luxury is developed to the highest degree. The car is entirely operated from the driver's seat. Lights are controlled from the dash. All oiling places are conveniently located.

The price of either the Five-Passenger Touring Car, the Torpedo or Roadster models is $1875, f. o. b. Detroit.

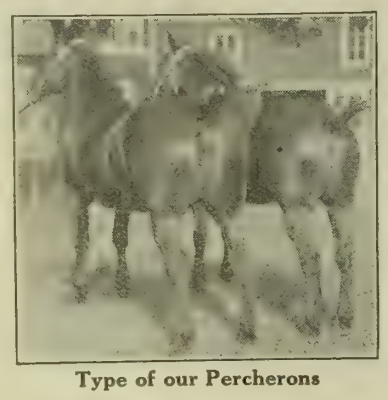
THE IMPROVING POWER OF PURE BRED SIRES.

Fourteen years ago a Kansas breeder owned a pony mare weighing 780 pounds. She was bred to a fine registered draft stallion; the filly from this union developed into a good mare, which was bred to another fine registered draft stallion and the cross produced the above gelding which weighed 1,600 pounds and sold for $242. If every mare was bred to an outstanding individual, American horse stock would increase rapidly, both in quality as well as in financial returns rendered to owners of mares.



Grahum Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

Always headquarters for the Best in

STALLIONS and MARES

Percherons and Belgians

In addition to the large number of Prize Winners at the French and Belgian shows this spring in Europe and at the various state fairs in this country this fall, we have a very large lot of good young stallions and mares of extra quality and bone, that we will price very reasonable.

We can show you 150 head of horses of the different breeds, the best lot ever imported to America. Sold with a reliable guarantee.

J. CROUCH & SON, Props. LAFAYETTE, IND.

TRUMANS'

CHAMPION STUD

The world's greatest collection of Shire Stallions and Mares, Percherons and Belgians to suit the most critical buyers; Hackneys of Richest Breeding and Strongest Individuality.

Fifth 1912 Importation of Shire and Percheron and Belgian Stallions arrived, Oct. 29. Thirty-four years in the business and not one dissatisfied customer.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us.

Address for illustrated catalogue and other information, mentioning the American Breeder.

Trumans' Pioneer Stud Farm

Bushnell, Illinois

Wolf Bros. Big Boned Imported Percherons and Belgians

We landed September 1st with a great lot of Percheron and Belgian stallions and mares. We showed at the great Nebraska State Fair September 5th and won the following prizes:

Two champions, one reserve champion, eight first prizes, seven seconds, one third and three fourth—twenty-two ribbons in all.

THESE PRIZE WINNERS ARE ALL AT OUR BARNS AND FOR SALE AT VERY REASONABLE PRICES.

If you are figuring on buying a first-class stallion or a pair of imported mares and want to see the best horses, you cannot afford to miss the opportunity to see ours. Special low prices made for the next 60 days. Address, for all information

Wolf Brothers

Albion, Boone County, Nebraska

TAYLOR & JONES

Williamsville, Sangamon Co., Ill.

Our new horses are now in the barns, and we have an extra good lot of Belgians, Percherons and Shires. We invite buyers to call and look them over. We buy the best we can buy, and if there were any better to be found we would handle them. Our guarantee is safe, and we can protect a buyer from loss for the full purchase price. Come and see us. It won't take long or cost much, and we feel sure we can save you some money.

TAYLOR & JONES, Williamsville, Sangamon County, Ill.

PETER HOPLEY & SON,

ATLANTIC and LEWIS, IOWA,

Importers of PERCHERONS and SIRES

We have been making from one to three importations a year since 1884 of the best stallions and mares that we could find in France and Great Britain. **We have now the best lot of both breeds** of stallions and mares, nearly all two-year-olds, that we have ever had on our farms at one time. **They excel in weight, bone and quality.** We have two-year-olds weighing in moderate flesh **up to 1,950 lbs.** We have secured a number the get of the most noted sires in France and Great Britain. **We have a number of top show horses.** We want you to come and look them over, and you will agree that what we have said is conservatively stated, and in spite of our selections we are able to quote very moderate prices. Remember, our horses are all kept at the farms between Atlantic and Lewis, on the main line of the Rock Island, 60 miles east of Council Bluffs.

PARAMOUNT STOCK FARM

Imported and Home-Bred

PERCHERONS, BELGIANS AND SHIRES

My new importation of stallions and mares, which I personally selected, arrived last month. This importation, numbering over 40 head, comprises the best lot I ever imported, and with those already in my barns and pastures, makes Paramount Stock Farm one of the best places in America to come for strictly high class stallions and mares. Among them are prize winners and tops that cost a lot of money. Come to the farm, 2 miles north of Hudson, 9 miles southwest of Waterloo, and see them. Address, mentioning the American Breeder,

Facts For Horse Breeders

Improvement of Stock, From Farmer's Standpoint, Mostly Made in Recent Years. Influences of Our Growing Mule Trade and of More Intensive Farming.

Those who expect to raise horses are much interested in the future horse market. There are a few who believe that the automobile will displace horses. Individuals who have paid little attention to horse production have always been with us. When the locomotive put in its appearance a great many expected to see the horse go out of existence; the bicycle had a few followers. There is no power that will ever wholly take the place of horses.

During the early settlement of this country little thought was given to horse breeding. The western part of this great domain was a pasture paradise. It was not necessary to pay much attention to horses for they were raised very cheaply. It was only necessary for ranchmen to let a band of mares run, without giving any care or attention excepting the branding iron. The demand was not for horses of extra quality, at that time, so that practically all development in horse breeding covers only half a century. During that time the markets have fluctuated greatly. This is one reason that horse breeding is not farther advanced. The cheap method in which horses were produced afforded an opportunity to overstock the market.

This is the history of every new country during the period of its settlement. In European countries these great fluctuations in horses are never known. The prices usually remain stationary. Horses (from the farmers' standpoint) have not been considered seriously in this country until this last, and still present, land boom. In '73 and '93 horse stock on ranges was killed like jack rabbits. In '93 it was carried to the extreme, and horse areas were nearly depopulated. In the western country grass was wanted for cattle and sheep. Little did these ranch men and others think of what they were doing. Since that time there never has been a surplus of even the inferior stuff in the western states.

Nearly every week in the year horses and mules are shipped from Kansas City to the western states. There are nearly 160,000 irrigated farms, most of which have been watered in the last 15 years. This has taken an enormous number of horses. The irrigation projects are only nicely started. These irrigated farms, as a rule, are very intensely farmed. As a result of the great scramble for land practically everything of any value is now owned, and has a consideration greater than ever was known in this country. Cheap pasture is a thing of the past and this will have a tendency to eliminate the inferior stock. The population in this country is increasing every year. The foreign immigration to this country is phenomenal. The writer has visited a number of foreign countries and find that great numbers of the people still intend to come to this free country of ours. This means a greater production of farm and live stock products, for these people must be fed and as the country becomes more thickly settled, it will be farmed better as a necessity.

In Belgium the average farm consists of about three acres of land. This is where the heaviest draft horses in the world are used and produced. If we follow the example of this productive section, large serviceable horses will be in great demand for farm purposes. Those people have learned that to farm those small tracts of land successfully, a considerable power is necessary. Only about one-third of the United States is considered horse or mule producing territory; that is, this much of the United States produces more horses than are consumed—the remainder is horse buying territory. In addition to the sections which depend on purchasing horses and mules, we find that mule production is retarding the increase in horses more than any other factor. One-fourth of the mares in the United States were bred to jacks last year. This stops one-fourth of the increase, and the mule industry is increasing each year. If it continues to increase for ten years with the same proportion that it has multiplied in the last ten years, we do not know where the horse market will go to in this country. This country owns and produces more mules than the balance of the world; they are being shipped from here to nearly all nations that use mules. A great demand will be for larger mules, as a rule, for export purposes. If American mules can be exported profitably, as is now being done while mules are higher in price than ever before in American history, with such a wonderful outlet, what need the horse breeders fear as to price?

During the last two years the germ has been discovered that is making many mares barren. Experiments have been carried on that show beyond question of a doubt that this germ can be carried from a diseased mare to a clean, healthy mare, from two to four days after the diseased mare has been served. This is an alarming condition and it can only be remedied by a better understanding on the part of those who maintain stallions and jacks. Mare owners should not patronize stallions or jacks unless the owner of such stock makes a careful examination of all mares and absolutely refuses to breed those that are diseased. Barren mares have caused a greater loss in agriculture today than any other cause known. After having an opportunity to confidentially investigate a great many service record books covering many states, we have come to the conclusion that only one mare produces a foal old enough to wean out of each three mares bred. This would not lead us to believe that horses were increasing rapidly.

Another serious drawback is that the high prices are taking many valuable young mares out of the breeding ranks leaving in their stead to be used as brood mares, animals which are neither very valuable as producers nor liable to be regular breeders. The value of a good producing dam of any kind has never been fully realized by the American farmer.

The statistics even do not give a fair idea as to horse production. Owing to the great changes that have taken place in this country, farmers that formerly used two horses to a small implement are now using from three to five, and heavier and better as a rule. Farm help was never scarcer or higher and every place a horse can be utilized to save the wages of a hired hand, it is done. This country is just going through its proper settlement which we believe will last for many years. There is no other country like this. Each year we are finding that many new lines of development are very profitable. It is the development that stimulates this demand for men and teams. The average wages of a man and a team (team weighing over a ton and a half) in the large cities is over $6.50 per day, and so great is this demand upon our draft horse stock that the quality of these horses is not as good as was found on the streets a few years ago. The farmers are finding it profitable to farm their land better. The staple crops of this country are usually high all over the world.

With the present prospect for future development there does not seem likely to be a surplus of good horses, but the producers of these animals should give this question more thought. The demand is for certain market requirements. Too many farmers are raising horses of an inferior type that are not very profitable. A majority of this plain stock is a drug on the market and much of it is produced at an actual loss. This will never properly be remedied until the farmers themselves create a demand for better sires. All live stock improvement among the common classes is made through the use of better sires. A well bred sire and an outstanding individual has a great value to every producing community. If a stallion sires fifty colts per year that are worth at maturity $100 more per head than those sired by inferior sires, what is the value to that community in one single year? We have not placed this value too high. This margin can be proven in a community where good horses are bred. It is very easy to add $100 to the offspring of an average mare by using an extra good sire and developing the progeny.

Encouraging the Use of Scrubs.

Every owner of a good stallion or jack can benefit himself and his community by sending in a good list of mare owners for the mare owner editions. One extra colt should more than pay the subscriptions for one hundred customers. A large number of them have sent in their lists. We are wondering why others have not done likewise. If you want scrubs to flourish, do not send in mare owner editions. If you want to improve the stock in your vicinity, get busy. We will do the rest.

Ten cents each in clubs of ten or more. Each mare owner will get two papers in February and two in March. Send your lists today. The mare owners' edition will not be sent for several days. This space in the mare owner edition will be occupied with an introduction to mare owners. Otherwise the paper which goes to the mare owners will be exactly like this one.

SCIENTIFIC BREEDING SCHOOL.

The next term—February 17 to 22—will be the last and only term in Scientific Horse Breeding before the breeding season. Those who wish to be thoroughly equipped with practical work should be on hand at that time. A demonstration where breeders are expected to take part in the real work, makes this school very valuable. It is one of the most interesting sights that any horse breeder ever saw to see a large class of stallion and jack owners working on a mare while she is being dissected. It gives them lasting memories of these organs and their functions. In fact, it is the real foundation for all horse breeding subjects. There are a lot of men in the breeding business that have been opening the mouth of the bladder instead of the mouth of the womb.

A very large class is expected and preparations are being made for the best term of school ever held. It will begin every morning at 7:30 and last until 10:30 at night, consisting of demonstrations, lectures, lantern slides and illustrated work. It is remarkable how much real information these students can accumulate in one week, and it is made so plain that any one who will apply himself, can understand the work. This is the important feature.

Don't forget the date, and remember that this will be the last term before the breeding season. Fathers and mothers need not be afraid to send their boys to this school. The influence around them will be as good, and in many cases better, than they have at home. They will learn les-

sons that will be very valuable to them and their families—lessons that they cannot learn anywhere else that we know of. Any one who attends this school will very likely go home a better man, in more ways than one, than he was when he came. There are numerous surprises connected with this school. The tuition fee is $25 for a life membership. Any breeder who wishes to attend and is not absolutely satisfied in every respect, can have his tuition fee refunded, and he alone is to be the judge.—Advertisement.

IMPROVING THE STOCK.

To the American Breeder: As I like this paper better than any other stock and breeding paper I have seen, I will contribute a few remarks as the editor has asked the subscribers for expressions on subjects of interest to others.

I believe the American Breeder is trying to help every horse breeder to produce better horses and mules and better methods, and I am sure if we will all try, that there is plenty of room yet for improvement as to better stock.

This part of the country is principally a mule country and people are more particular about a jack to breed to than a good stallion. It seems to me that they should be equally as particular, or more so, about the stallion, as we have got to have the good big mares to produce the big mule. There are very few registered stallions in this county of any breed. I think if the mare owners would demand better sires and refuse to use the scrubs, the stallioners would get better individuals. Whenever a mare owner uses the mongrel sire instead of a good one, he is encouraging scrub stock, but to refuse the service of a scrub and use better ones he is encouraging better horses and we certainly need more of them here. There are lots of good draft horses standing in dealers barns, that, if it wasn't for the scrubs being so thick, would be out in the stud improving our stock. But there are so many here that would use a scrub at $5 instead of a good draft horse at $15. They can't see the $25 to $100 difference when they are matured.

Yours for better horses and mules and better methods of producing them. T. J. Cunningham, Newton County, Mo.

WINDOW SURFACE FOR FARM BUILDINGS.

Many farm buildings are poorly lighted; while a few are overlighted and cold. The amount of window surface required is rarely if ever estimated in a practical way. Guesses or convenience or cost are the usual methods of determination. Yet the relative amount of window surface and light admitted is so important, so necessary to good sanitary conditions that state laws are being passed prescribing the smallest window surface admissable in dairy barns, in order to safeguard our milk supply. The following amounts of window surface are recommended for the different farm buildings: Allow one square foot glass to twenty to twenty-five square feet of floor space in horse, cattle and large swine barns.

Allow one square of glass to every fifteen feet of floor space in dairy barns and poultry houses. In very cold climates the large glass area in dairy barns may make the use of storm windows advantageous. To be the most effective, windows should be long vertically and have narrow jambs. E. W. Hamilton, Agricultural Engineer, Idaho Experiment Station.

An "automatic cream separator," with a little built-in engine to run it, is among the latest aids to the dairy man being advertised. Labor savers have a welcome place in dairying.

ANOTHER WHO STUDIES HIS BUSINESS.

To the American Breeder: Enclosed find a few lines in praise of your valuable paper, as I have been a reader for some time and never have failed to find something of importance in each issue, and when my paper don't come on the day it is due, I am always dissatisfied. I read every article from cover to cover, and find that breeders all over the country have some of the same experiences that I have. I have been in the breeding business for five years and find that there is always something to be learned.

Last year was my first experience with capsule breeding; only bred a few mares but got along with it fine and had good success. One mare which seemed to be in perfect health was bred several times each season for two years by natural service, and failed to conceive, but last year one capsule did the work.

I have three stallions and one jack; one Percheron, one Standard Trotter, one German Coach and one Tennessee Mammoth black jack. This stock is sound and right in every way. I like the breeding business and have gone to a big expense to encourage raising better horses in our locality. I find too many men who would rather breed to inferior grades than to pay the price of a good sire, which every reading and thinking man knows is standing in his own light. If I continue in the breeding business I intend to attend the Graham Scientific Breeding School, as I feel the need of more knowledge on these lines. I shall continue to read your paper and advocate its principles. Wishing the American Breeder and each of its readers a successful year, I am. —FRED FRENCH, Warwick County, Ind.

FEED FOR STALLIONS.

To the American Breeder: It seems to me one of the greatest troubles with most people in handling stallions is the feed. There are so many men that think they haven't time to feed and care for them properly. They will have them away off in some dark stable very unhandy to get to, and just throw in a few ears of corn and possibly a little oats. Just think of it yourself; if you had to sit down to a little bread and water you would soon get tired of that and your insides would soon be flapping together.

This has been my experience: Give them plenty of mixed feed, such as oats, cut hay or straw, or some good bright cut up cane and a little shorts, mixed well with water. Give them a reasonable amount of your other mixed feed and then pour this on top and turn it over in their feed box and see them go after it. It surely is a feast for them. And not only that, but it keeps their bowels regular. One of the secrets of feeding is to use the feed that will digest. Give this once or twice a day and you will have a good, strong horse that will go out and make a big season and get 80 per cent of mares in foal.—JOHN W. WADDILL, Adair County, Mo.

SUGGESTS SPRING STALLION SHOWS.

To the American Breeder: There are a lot of people who think that the American bred horse is not as good as the imported. But I think he is better, and you will all agree with me. But there is better pasture in summer in Scotland and England than we have and they don't have to feed so much grain. But we can grow them just as large as they can. I have raised horses in both Scotland and America and have had 3-year-olds weigh one ton and have had foals weighing 1050 at 9 months old, and took first prize at state fairs.

The only fault I find with American farmers is, they will not feed their colts. That is what I tell them. If they will buy a good mare and then look for a good sire, and then not forget the oat bin, I will assure them they will raise a good colt. But I don't see why they don't have spring stallion shows in this country so breeders could show their stallions, and it would encourage the farmers to look at them. I think it would be a good thing to help to encourage them, and then it would show where to get good sires to breed from. G. M. Clark, Lancaster County, Neb.

PLANS FOR A COLT SHOW.

To the American Breeder: My imported Belgian is 3 years old and weighed 2100 pounds at 3. My Percheron at 3 weighs 1920 pounds. The jack is 15½ hands high and weighs 1050 pounds. They are all sure breeders. I used the capsule system last year and had very good success with it and expect to use it more this year. I have been in the breeding business about ten years; have three registered Percheron mares, all of which will bring colts this spring.

I intend to hold a colt show this coming fall and offer such premiums that will encourage the farmers to come and bring their colts, and also to encourage them to take better care of their mares and colts. I expect to hold these colt shows at my farm four and one-half miles southeast of Ottawa, where I stand these two horses and jack, and advertise before so that everybody that has a good colt can bring them, and it will also be good and cheap advertising for my breeding stock. It will bring people that have been breeding elsewhere, and if I show the kind of colts I think I will, it will bring lots of new customers that have never seen the horses and jack. The success of such colt shows will encourage other stallion owners to offer premiums, and in this way colts from different horses may compete in these colt shows, and by getting a good bunch of colts together it gives the farmers an idea of the kind of horse they want to breed to.

A good start in having a colt show will prove a drawing card the first year and a feature thereafter, and will be an incentive to better breeding and better feeding, and this is sure to be a general improvement of the horse stock of the neighborhood. The draft horse of good size and quality will sell for more than any other farm animal per pound and the better the horse is at the time of sale, the more money he will bring. Anything we can do to encourage the farmers to produce better colts, and give them better care and feed, is sure to result in better prices and a larger market for that community, and be a cheap advertising for the stallion owners. W. W. Alexander, Franklin County, Kas.

ENDORSEMENT OF AN EXPERIENCED MAN.

To the American Breeder: I have been in the stud horse business for over forty years, and have learned more from your paper than I ever knew, but will not be satisfied until I take a course at the Horse Breeders' School.

One of my customers has a filly colt 10 months old that weighs 990 pounds.

I am trying to get a bill before our legislature in regard to breeding. T. H. Broughton, Pottawatomie County, Iowa.

The corn exhibits of thirty of the prize winners in the Missouri state contest, just decided by the Missouri Corn Growers' Association at Columbia, will be submitted in competition with those of thirty-five other states at the National Corn Exposition at Columbia, S. C., January 27 to February 8.

QUESTIONS AND ANSWERS

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

GRINDING CORN FOR HORSES—Should corn be ground into meal for horses?—West Virginia Subscriber.

REPLY—For a general healthy condition we would not advise grinding corn for horses whose teeth are in prime condition. To fatten animals it might be an advantage, or if the teeth were not in perfect order, it would be very profitable to grind the feed.

FEEDING BROOD MARES—I have four Percheron brood mares each weighing about 1,500 pounds. I let them run out during the day on good pasture and in stalk field; since January storm bringing them in barn on ground floor, box stalls, feeding oats, straw and six ears of corn twice a day. I think about February 1st will change the feed to oats and hay; first feed some oats with half ration of corn, then all oats until after foaling. Which is the best to continue feeding?—Illinois Subscriber.

REPLY—We are glad to see owners of mares pay more attention to the feed and management of their stock. As long as your mares have plenty of exercise and allowed their freedom during the day, it matters not so much what kind of feed you give, provided no severe change is made. All changes should be gradual. The mares should be kept in a good, thrifty condition. As a preference of feed we would advise oats and bran, equal parts by measurement, with prairie hay, and if alfalfa or clover is made a portion of the feed, less bran should be given. As these mares advance in pregnancy they will become a little more irritable and we would advise watching them closely to see if one is a severe fighter. If she has a tendency to kick she should be separated from the rest.

CONTROLLING A HORSE—We have a fine standard bred Arabian gelding; five years old; large and spirited, though not vicious or mean in any way, still is hard to control when automobiles rush by. He has ran with us several times and scared us badly, yet never quite "ran away" entirely. Can you suggest some plan, device or bit by which we can drive him with safety, single or double—usually we drive him with a mate.—Nebraska Subscriber.

REPLY—If you will get a "Conqueror" bridle you can hold this horse anywhere. We would suggest that you lead him around an automobile and teach him the word "whoa" so that when he hears that word he will stop, and do not use it at any other time except when you intend for him to stop still. A horse has so much the advantage of a man with an ordinary bridle that it is not advisable to try to hold a bad horse that way. Another very good method is to take the Rarery tackle. This is an arrangement that takes their front feet away from them and causes them to fall. When the word "whoa" is used, and the horse does not stop, pull the rope and the horse falls on his nose. This should never be used with a new horse except on very soft plowed ground, as he is liable to be severely injured. After they become accustomed to this arrangement, which should consist of a lesson of not more than 30 minutes each day for a week, they may be used anywhere with this arrangement without very much danger. This is really the only way to

make a horse safe. After an animal has been used with these pullies, and he realizes that if he does not stop when he is spoken to that he will fall and be absolutely helpless, they usually respond quickly.

THOROUGHPIN—I have a two-year-old filly with soft swellings in the hollow on the outside of its hocks, caused (I think) by a little plowing last spring. One is smaller now. Are they spavins and can I take them off?—Idaho Subscriber.

REPLY—The description of the location of the enlargements would indicate that your animal has developed thoroughpins, which is perhaps due to her being put to work too young. It is not likely that they will cause lameness provided you do not aggravate them by continued work. They are very difficult to remove and we do not believe you are justified in attempting it.

UNTHRIFTY STALLION — I have a stallion here that is thin in flesh and for the past two months has been grunting and groaning when he dungs and now his left hind leg has swelled from the belly to the hock. He eats good and is always ready for his feed. I feed oats and bran mixed with just a little corn. What can I do for him? Don't say, call a veterinarian, as there is none here.—Florida Subscriber.

REPLY—Your description does not point out any certain ailment so, inasmuch as you do not have acess to a competent veterinarian, we are only able to suggest a general treatment with the hope that you may be benefited. If your stallion has been receiving good care and remains unthrifty we fear he is suffering from some chronic ailment that may prove incurable. Give every attention to proper food, water and exercise with plenty of grooming. If constipated or infested with worms, give him a purge of one ounce of powdered aloes. Follow this with two ounces of elixir of iron, quinine and strychnine three times a day for a week or ten days and then discontinue and give Fowler's solution in the feed three times daily, giving one-half to three-fourths of an ounce at each dose.

DISEASED FEET—I have a jack that has been in Oklahoma for three years. When I got him he was almost a skeleton and so lame he could hardly travel, especially in front. I wondered if he had been foundered or alkalied. The wall of the hoof would itch and peel off. The bottom of the foot had a crumbling appearance. I have been oiling them with linseed oil once a day for four months. He has improved very much since, both in flesh and the lameness is fast disappearing. The soles of the feet are beginning to look healthy, but the hoofs crack and crumble yet. I have been advised to apply what I would term muriate of copper to the soles of the feet. This consists of copper dissolved in muriatic acid. Will you advise me through the American Breeder?—Missouri Subscriber.

REPLY—We do not believe your jack will be benefited by applying the preparation of copper mentioned. You will do better if you will either soak or poultice his feet for several days or until they are soft, and then apply the oil for the purpose of preventing them from drying out again. The oil will be more effective if you add to it about one-fifth oil of tar. Following the soaking with an occasional cantharides blister about the coronet so as to stimulate a more rapid and healthy growth of the hoof.

AZUTORIA—We have a mare about eight years old that became suddenly ill and we were compelled to take her out of the harness and left her with our veterinarian. The mare suffered from azutoria, the doctor told us. We now have her at home and while she eats well, and apparently is not suffering, she is unable to use her right hind leg properly. The leg is always in a flexed or bent position and when she walks the muscles appear knotty, as they also feel when we raise her front foot and compel her to use both hind legs. Will she outgrow this condition or ought we assist nature, and if so, would appreciate suggestions from you. The attack came on the mare about ten days ago.—Wisconsin Subscriber.

REPLY—Azutoria is regarded as a disease that primarily affects the muscles and often times the nerves controlling the affected muscles become involved. Such cases are frequently followed by marked atrophy and paralysis of the parts, greatly interfering with proper support and movement of the limb. At this time you should begin a system of gradually increasing exercise, first allowing the animal the freedom of a lot or pasture. In a short time if the animal shows strength and some improvement it should be driven to a light rig and gradually accustomed to drawing weight. The weakness and subsequent atrophy must be met by forcing the muscles back again into action and if the system is carefully and patiently pursued, nearly all cases of threatened atrophy can be checked. One should not continue the work too long at a time so as to produce exhaustion. Short, sharp pulls followed by rest give the best results. During the treatment apply some stimulating liniment to the parts and in so doing make use of plenty of hand rubbing.

WARTS—I have some spring mule colts whose noses and upper lips are covered with warts about the size of pin heads. What can be done for them? —Nebraska Subscriber.

REPLY—If such small warty growths are snipped off rather closely with a pair of scissors and the parts touched with a pencil of lunar caustic, it will nearly always cause them to disappear.

ABORTION—What is good for a mare that won't carry a colt to the proper time?—Texas Subscriber.

REPLY—Various agents are used to ward off or prevent abortion, but perhaps the most dependable agent is some preparation of black haw. Begin two months before the usual period of aborting and give a teaspoonful in the feed three times a day. As you near the danger period gradually increase to three teaspoonfulls and if threatening symptoms appear this may be even doubled. Continue the agent until the usual aborting period is past and then gradually reduce the amount until finally discontinue it.

LAME JACK—I have a jack that I suspect has rheumatism and would like your opinion on him and your treatment. We noticed him being first sore about two months ago, as though his feet had been trimmed too short. About six weeks ago he was taken bad and would lie down all the time until you would make him get up and when he did get up he would set his hind feet forward and would jerk his front feet up as though they were paining him. He seemed so sore he could scarcely walk but when he was lying down he did not seem to be in any misery. We bedded him heavy and kept him blanketed. He stands up a good part of the time now, but is still very sore. Local veterinarian pronounced it founder, but he was getting his regular feed, water and exercise. His appetite has been good all the time and he drives well.—Kansas Subscriber.

REPLY—The symptoms you describe are very much like those of laminitis and your veterinarian should be able to determine this point. If no improvement has resulted from the treatment already given, we would suggest that you give him a half ounce of salicylate of soda three times a day for a week or ten days. Large warm poultices applied daily to his sore feet during the period should aid in relieving the difficulty if laminitis is present.

RHEUMATISM—I have a very large two year old jack that got lame in his right foreleg about the first of October last; was lame about three weeks and apparently got well. Then in a few days he was lame in his right hind leg and was lame about the same length of time and got all right. Has done the same way in the other legs. He now seems to be all right and is apparently in good health. I had a veterinarian to see him and he said it was rheumatism, so he treated him but did no good. Would be glad to hear from you in regard to the trouble.—Missouri Subscriber.

REPLY—The symptoms you describe are quite typical of rheumatism and it is very likely that the diagnosis is correct. You should first see that your animal is housed in a warm, dry place that admits a plentiful amount of sunshine. No good can be expected to follow medication if the animal is kept confined in dark or damp quar-

Best Producing Females

We wish to encourage our readers to recognize and properly value, and care accordingly for their best breeding stock. We will be glad to have those interested in helping, to send in particulars concerning the profitable female. We are not asking that these individuals be "world beaters." We would like to hear from every community that has an especially profitable female, whether it be a cow, sow, ewe, jennet or mare. Here are some letters from our readers which illustrate what we mean:

To the American Breeder: I have a mare that has raised ten colts. We sold her first colt (mule) the fall of 1901 for $90, since then have sold seven of her colts for $1,310, have one mare and a colt coming yearling left. The young mare is an extra fine one. Will foal a mule this spring. The coming yearling is good enough every way for a stallion if his mother only had pure Percheron blood in her. This colt weighed 725 pounds at 5 months. R. A. Carpenter, Chariton County, Mo.

To the American Breeder: I have jennet, Queen of Oakwood, by imported Taxpayer. I have sold from her up to date, one yearling jack for $750; one three year old jennet for $450; one two year old jack, $1,100; one two year old jennet, $900; one yearling jack colt, $500. I have on hand one two year old jack, I think worth $2,000; one four year old jennet worth $400, and one suckling colt, I think worth, $500, a total of $6,600. I think the above record is pretty good for one old jennet. Allen B Harlan, Maury County, Tenn.

To the American Breeder:— I bought a mare five years ago last July. She had a mare colt sucking when I bought them. The next spring she had a horse colt, the next four springs she had a mule each year and is now in foal to an imported Belgian horse. The mare colt I sold when two years old for $150. The horse colt I still own. The first two mules I sold when two and three years old for $265 and the two mules coming one and two years old, I still own. This mare raised two colts before I got her. She weighs 1,450 pounds, will be 14 years old next spring. She is black and her horse colts and also mules are all black. She does her share of the work in summer and I have never had to breed her more than once for each colt. She has raised four mules and four horse colts in succession and is now in foal. G. W. Ostrander, Knox County, Neb.

To the American Breeder:—The great Percheron show and brood mare, Bess 18667, owned by Geo. R. Kinnan of Elkin, Pa., died from an attack of azutoria, January 23.

Her owner informs me he has sold $4,775 worth of colts from her and five of her offspring in his stables yet. Her colts have been sold into several different states and like their dam, they have all made good.

This mare has been shown at 27 leading fairs. She has won 25 first premiums and two seconds. She was 18 years old; never refused a feed in her life; made half a team ever since she was two years old, and was noted for her intelligence and great powers of endurance. Geo. R. Kinnan, Indiana County, Pa.

To the American Breeder: — I owned a trotting bred mare that I began breeding at five years old. She was a sure breeder, raising 13 colts and dying at the age of 19 years. She missed only one year, and that was because she was bred to my two year old stallion, which got no foals that year. This mare not only had 13 colts, but raised every one of them and every one was raised without a barb wire mark. This latter, I consider very remarkable for colts are always running against wire fences.

I had another, a part Clydesdale mare, that foaled me 15 colts, but lost several of them, at, or near foaling time. Her colts were also always getting cut on barb wire.

The former mare was a small mare about 950, but raised very nice road horses when bred to road stallions and good general purpose horses, when bred to my Percheron stallion. One pair of her colts (full sisters), took first prize at the Sioux City fair for fine driving team. Lester Jones, Edmunds County, S. Dak.

MORE BIG JACKS.

To the American Breeder: I saw in the American Breeder, January 20, D. A. Sprague, Clark County, Ohio, giving a description of his big jack. I think I can beat him a little in size and age. I have a registered Spanish jack, 5 years old, 16¼ hands standard, weight 1,250 and thin, girth 70-in., flank 70-in., arm 20½-in., knee 16¾-in., smallest below knee 11-in., hock 20-in., below hock 14-in. H. C. Bradstreet, Putnam County, Ind.

To the American Breeder: In the 20th of January issue, I notice that Mr. Sprague of Ohio, gives measurements of his jack that I consider good, but not perfect by any means. In comparison, will give measurements of my Taxpayer jack, coming 4, August 4; black, white points, 16 hands, standard, weight 1,080, in winter condition, girth 72, flank same, arm 20, knee 17, bone below knee 9, hock 20, below hock 10½. I purchased this jack as a herd header and believe I have made no mistake. I know neither Sprague or myself own the best in the world, but think they will average quite well with others.

I, like Mr. Reager of Tennessee, am anxious to hear of the 15-hand yearling reported last year. W. F. Burnett, Jackson County, Ill.

To the American Breeder:— How are these measurements for an "Arkansaw" jack colt at 8 months of age? Ears from tip to tip, 30 inches; girth, 53 inches; flank, 53 inches; arm, 16 inches; knee, 12 inches; smallest place between knee and ankle, 7 inches; height, 13 hands; weight, 420 pounds. This colt's dam is a 14-hand jennet and his sire is a 15½-hand Kentucky jack—all black with white points. John W. Carlson, Logan County, Ark.

MISSOURI MULES.

To the American Breeder:—The mule should be raised on the farms of Missouri and other states becaues they are the next thing to the cash in your pocket or on deposit in bank. I never heard of a mule getting foundered. They don't have the colic, thousands of horses die annually from colic and founder. You will see many horses cut on wire, to one mule. You will see one hundred horses blind to one blind mule and you will see one hundred dead horses to one dead mule. I don't know what becomes of them, but don't think they die. They are the farmer's friend and financial helper. The farmers that raise mules are all making money. Raise the good kind, give them plenty to eat, and they are sure to make money. One team of mules will outwear two teams of horses on the average. Missouri raises the best mules in the United States. The Missouri mule is looked for now by the buyers of the world. Raise the mule and make money. M. V. Dillingham, Union County, Mo.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED,
225 WEST TWELFTH STREET,
Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Chicago Representative,
JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates.

1 inch: 1 month, $5.00; 1 time, $2.80.
½ inch: 1 month, $2.80; 1 time, $2.00.
Rates for longer time or larger space furnished on application.

Subscription price, per year, $1; three years, $2; clubs of four, per year, $3.00.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter, November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

All persons are warned not to reprint any part of this paper without giving full credit for the same to the American Breeder, Kansas City, Mo.

CLOSER RELATION BETWEEN BREEDERS.

The owners of every good stallion or jack should have a list of all the mare owners, extending out as far as this breeder expects to command business. These names should be in alphabetical order. Any date book for keeping them will do. Two or three pages should be given to A and a reasonable amount of pages to B and so on through the book, so that when one wanted to find a man by the name of Brown, he would look in the Bs. This man's post office address should be given and his telephone number and if possible the numbers of the land on which he resides, or at least, the name of the farm upon which he lives. Every breeder should get a county map showing the section and township lines and study the location so that he may be better posted in case of an emergency call. Mare owners should be instructed to communicate with the owners of the breeding stock, so that in case an accident or an abnormal condition would arise communication can be established quickly. Frequently a mare has difficulty in foaling and the mare owner can call this stallion owner, who will, in return, advise him when to get a qualified veterinarian. A great many mare owners ruin their mares by trying to remove the colt themselves, or they may wait until the mare is nearly dead before sending for a veterinarian, unless properly advised.

Every stallion or jack owner who owns good stock should have his telephone number on his bills and all advertising.

Owners of scrub stallions and jacks need not go to this precaution, for in many cases it would be just as well from a financial standpoint if the progeny should not live. Breeders should study their service record book closely and notify the owner of each mare when she is due to foal; this may be done with a postal card that has been printed for this purpose, leaving blank the name of the mare and date of foaling. Or the telephone may be used for this purpose.

Good horses and mules are too high in price for us to take chances on losing them through ignorance and neglect. We hope to help establish a better feeling and a more perfect understanding between the owners of good sires and those who patronize them. They should all work together in harmony and treat each other on the square.

FEMALES NOT PRODUCING.

A part of the high cost of living can be attributed to the slack methods of breeding live stock in this country. The annual estimate of farm animals furnished by the Department of Agriculture, shows a decrease in the past year of 6,462,000, or three per cent in the number of head, while the total value is $492,500,000 greater than a year ago—an increase of nearly 10 per cent. A three per cent net decrease is not very extensive, but if the females were producing as nature intended, there should be a reasonable increase above consumption. It is important to note how many mature females there are in this country without any progeny. There is no other subject connected with agriculture so sadly neglected as that of animal production. This decrease can be attributed largely to the slack methods of our breeders. This country is increasing in population very rapidly, and unless more attention is given to this subject the supply of meat will be greatly curtailed.

It may be necessary to include the equines in the dressed meat division, the old horses being fed up for food. There are about 50,000 horses eaten every year in Paris. Practically every nation speaking a foreign tongue eats horses. There are in this country a very large number of foreigners who would welcome the opportunity to partake of the horse. Horse meat is not bad food after the appetite is accustomed to its use. Horses are not subject to tuberculosis and some other diseases which affect our meat producing animals. Physicians have advised horse flesh, largely for tubercular patients in foreign countries.

There is one of two things that American people can do, that is pay more attention to the females so that they will produce with more regularity or make some radical changes in the food supply.

FARM HOME EQUIPMENT.

In this day of activity and continuous study from a financial standpoint, one particular section of the farm home has been sadly neglected. That is the kitchen. There is no other part of the farm home as necessary as a well equipped kitchen. One may visit the average home and the front or introductory part of that dwelling may have an excellent appearance, but entirely too frequently the kitchen is the badly neglected part.

Men who labor should have an abundance of well prepared food in order to preserve the strength and vigor necessary in this day. A few dollars spent in properly equipping a kitchen is the very best improvement that can be made on any farm. Every kitchen should be piped with water so that in cooking, one need not travel a great distance in supplying the most used article in cooking—water.

Another thing necessary is to have a good stove—one that can be lighted easily and quickly—with numerous containers so that different articles may be kept at a proper temperature. A good reservoir should be provided where the dishes and other vessels can be boiled to properly sterilize and destroy all infection. The arrangement of the kitchen should be as convenient as possible to the dining room to save as many steps as possible. It is safe to say that if the head of the family would spend $10 in the kitchen of the average farm home, it would be the best investment he ever made. This improvement will last a lifetime and many extra dishes of a palatable nature will be prepared. Such an arrangement would cause any cook to be delighted with her work and to learn all the things about preparing the necessaries of life. Most of the serious stomach trouble that is now entirely too prevalent, along with constipation, which is a familiar thing in nearly every home, can be prevented with just a little expense and some additional thought. The high cost of living can be greatly reduced with the modern ways of preparation and a reasonable amount of study.

The next necessary thing in a farm home are good beds. Those who toil long and hard require a considerable rest. This cannot be had in any place so well as in a good bed. This bed should be located in a room well ventilated, with an abundance of light during the day time. Light, and especially sun, is a great germ destroyer. Do not keep the blinds pulled down to prevent the dust from blowing in the house. As a rule, it is necessary in every sleeping room that it be well ventilated and have a reasonable amount of daylight.

A little thought in this direction will keep a great many men at home; they will enjoy these extra meals and an excellent place to sleep; they are more easy to get along with. A man who has plenty of rest and a well satisfied appetite, is more peaceful. Our American women in this free country of ours are not as happy and contented as they might be; too many of them have a dejected, worn out look. If they and their husbands would think about these extra steps and have a little better means and methods for doing their work, and think of their general health a little more, the result would be happier families more robust children and better communities.

THAT FALSE MODESTY.

Realizing the great necessity of reaching owners of mares, and trying to help them raise a greater percent of foals, and better individuals, the writer sent out an article to one of the best farm papers in America without asking, or expecting, any compensation. The article was returned with a letter stating that it went into details too much and could not be printed in that publication, as all members of the family read it. In Europe these subjects are discussed freely among breeders of live stock. The ladies speak of ordinary breeding subjects as a matter of business; they realize that a gentleman will respect intelligent people. In this country it is a common practice for an entire family to talk about breeding chickens, dogs and other animals excepting horses.

Is it that horses are so much like humans that they are placed in the prohibited list? We do not understand why this difference exists, but we do know one thing and that is, that 75 per cent of the surgical operations performed (barring accidents) are the result of ignorance concerning infection. If mothers, wives and daughters knew as much about these subjects as they should, there would be less suffering and more healthy children. Which is the best, to consider a woman as an intelligent, happy, healthy individual, or one who must endure untold suffering because of ignorance?

Articles will appear in this publication from time to time on the subject of infection. We hope that every father, husband and son will invite his entire family to study these subjects and know the dangers of infection.

Through the microscope, wonders have been developed. We wish to call attention to one particular disease that has been called a "harmless" condition, but which is one of the most serious diseases known to mankind. This is gonorrhea. Some physicians have said that it was no worse than a bad cold. Any physician making a statement of that kind should be barred from further practice. In most cases the patient never entirely recovers from this disease. A young man may encounter this condition and be cured of the discharge, but he is not cured of the disease, as a rule. He still harbors the germ in his system. After he marries the wife suffers the consequence of his early career, to the extent that a very large per cent of the cases of female trouble are the results of this infection. When children are born, statistics show that a very large per cent of "child blindness" is the result of this infection.

This is only one of numerous conditions that every mother, wife and daughter should understand. There are not many who wish to bring this suffering into a family, for it is in many cases permanent through life. If every individual could understand the exact condition in these respects, the virtue of the people in general would be greatly advanced. If the American people are not to be taught these dangers through the papers that are willing to explain the exact situation in plain language, how are these conditions to be eliminated?

The medical fraternity is well versed in technical language and understands the exact conditions, but that information does not reach the public in time for prevention—the thing most needed.

The writer, through his investigation of scientific horse breeding subjects, has had access to all such knowledge, and we feel it our duty to make some statements along this line. Just recently a mother notified this office that she did not want the American Breeder to visit her home; that she did not feel that it was the proper material for her family. This home is not far distant, and the editor wishing to understand more about the situation, visited that section. He found a child who will never see and another one of the family with an incurable disease. If that mother had known a few years ago, what we are trying to teach through these few short statements, there would be a different home. As it is, this mother must nurse through life two of the most disagreeable cases which could be described. One may say, "as for me and my family we would not encounter these conditions," but every man that raises a family is responsible for it. It is absolutely impossible for him to guard all members through life. The only lasting protection that can be given is education. Risks, which the ignorant might take, will never be taken by those who know. One little germ may be the means of exterminating a whole family.

CLOSE OF WINTER MEETINGS.

The six or eight weeks just closing is a season of state agricultural meetings throughout the corn belt. These meetings are held, as a rule, at the capital of the state or at seat of the state agricultural college. In some cases, as in Kansas, there are two or even three sessions, the first session in Kansas being held at the agricultural college and the later two sessions at the capital.

In each state there are from ten to thirty organizations more or less agricultural in their nature, which carry out programs, or at least hold business meetings during these winter sessions. In many cases this big list of organizations will hold all of its meetings within one week and frequently that week is called "Farmers' Week," and the entire town and institution at which the meetings are held is given over to the entertainment of visitors. The benefit of these

meetings is very great, but there is often this drawback, that too much is crowded into too limited a time. To report any one of these meetings anywhere near full would require several pages of this paper. In fact, a full report of a single association, which often includes a list of prizes won in some contest which the association conducts, would take as much as two pages. Inasmuch as the American Breeder has a large number of subscribers in every state in the corn belt, and has some subscribers in every state in the Union, not to mention Canada and several foreign countries, it is evident that we cannot make special mention of these meetings, much as we would like to. Much of the information given at these meetings in the form of papers and addresses, we have already been able to offer to our readers, and as fast as possible we will cover additional ground, giving such information as we have not already reached, and in that way will contribute to the best of our ability to the great work which all of these state agricultural colleges and associations are doing. We would like, however, to print the names of the newly elected officers of every one of these organizations, or at least the name and address of the secretary, so that any seeker for information as to what any particular state association is doing, will know where to apply.

A Big January Horse Business

Nearly a Third More Than For January, 1912. High Point Knocked Off Prices for Beeves. Thin Sorts Hold Their Own. Hogs Lower Again.

The volume of business transacted at the principal horse and mule markets in the past two weeks has been large. Combined receipts of horses and mules in St. Louis and Kansas City in January were close to 27,000, or nearly 33 per cent larger than in the same period in 1912. This large supply has sold with prices fluctuating only $5 to $15 a head, the principal break occurring on the week end trade when buyers had left with filled orders. Prompt recoveries occurred and the general price position of the market is net unchanged. The South has been the principal buyers, though there is considerable demand for good heavy drafters and farm mares. Southern buyers say that plantation owners and farmers are buying more mules now than ever before, and that they are preparing for the biggest seeding season ever known. This foreshadows another active buying season in the horse market when harvest preparations have to be met. The South is taking a much better class of mules than ever before. While their main demand is for the lighter weight classes it is not uncommon for some heavy mules that cost $250 or better to be included in shipments.

The demand for farm horses is just beginning to open up for the central belt. Losses of last summer, together with the fact that feeders have fattened a great many horses during the winter, make spring trade prospects unusually bright. A good many farmers have adopted the policy of buying mares, so that they can at a later period become producers. Eastern markets have not received as many horses thus far this year as in January, 1912. That trade has been backward owing to unfavorable weather. Eastern buyers, however, assert that they can care for all the good heavy drafters offered this spring.

While the average run is not burdened with quality, the pluggy kinds have not been much in evidence. This is the poor season of the year for plugs, and the fewer offered the better.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$235@275
Drafters, fair to good	150@225
Chunks, good to choice	135@165
Chunks, fair to good	85@120
Expressers and light draft	50@110
Plain workers	40@ 85
Southerns, good	125@145
Southerns, plain to fair	65@125
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 85@135
14 to 15½ hands	125@165
15½ to 16 hands	160@200
16 to 16½ hands	190@285

Big Break in Cattle Prices.

In the second half of January steers broke to new low levels for the season, and at the low point were 35 to 75 cents under two weeks ago. In the past three days, however, moderate recoveries occurred so that the net decline for the above named period was 25 to 50 cents. Heavy, thick fleshed steers were the greatest losers, and the light weight kinds that attracted bids from both killers and country buyers lost the least. Fairly liberal receipts, together with a let-up in demand for beef, were factors that caused the slump in prices. However, since the middle of December, it has been the policy of packers to depress prices, and in that time they sent prices down 75 cents to $1.50 a hundred pounds. The condition of the market is such now that feeders will have to offer small supplies or there will be still further declines. At river markets the run has been largely medium weight grades, though in the East heavy classes have predominated. The most important supply source for the next six weeks for river markets will be Colorado, the Panhandle and Oklahoma. Most of those offerings will be in the 1,000 to 1,200-pound class, so that choice heavy native steers should be given a chance to clear at higher prices. Prime steers are quoted at $8.50 to $9, fair to choice $7 to $8.45, and common up $5.75 up. On the quarantine side several car loads sold at $7.75, the highest price ever paid for that class in January. The bulk of the quarantine steers are bringing $6.50 to $7.25.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.50@9.00
Good to choice steers	7.50@8.45
Fair to good steers	7.00@7.45
Common to fair steers	5.75@6.85
Meal fed, choice	7.00@7.75
Meal fed, common to fair	6.00@7.00

Butcher Cattle Prices Steady.

In the past two weeks prices for butcher cattle fluctuated 15 to 25 cents, and in the past two days developed enough strength to close steady with two weeks ago. Receipts continue moderate, and it is keeping buyers in the saddle to get enough of this class of cattle. The bulk of the cows are selling at $5.25 to $6.50, and heifers at $6 to $7.25. Improved demand is expected as the season advancess, as no large supply is expected and killers will need all they can get to meet urgent requirements. Veal calves sold up to the highest level of the season, $11.50 being paid in Chicago and $10.50 in Kansas City. Since

Here's a Letter to Think About.

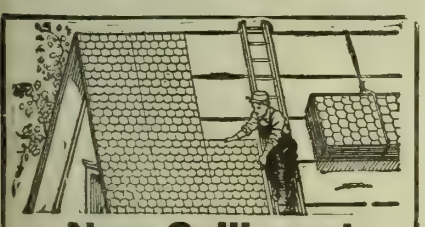
To the American Breeder: Last fall I sold two jacks through my ad in your paper, to the first men that came to look at them. I then answered L. W. Hoyt's ad in the American Breeder and found what I was looking for, the best jack colt that I have ever seen. While at his place, in Barry, Ill., he and his neighbors told me that he had bred 1,100 mares in that town and that he was a graduate of Graham's Scientific Breeding School. We took long drives through the country examing the mares and found better than 90 per cent were in foal, while in Iowa, I do not think 50 per cent are in foal, under the old system. I not only had a profitable and educational trip, but a very pleasant one for "Lee," as the boys call him, is the prince of entertainers.—Wyatt Carr, Story County, Iowa.

Sunshine Lamp 300 Candle Power FREE

To Try In Your Own Home

Turns night into day. Gives better light than gas, electricity or 18 ordinary lamps at one-tenth the cost. For Homes, Stores, Halls, Churches. A child can carry it. Makes its own light from common gasoline. Absolutely SAFE.

COSTS 1 CENT A NIGHT



We want one person in each locality to whom we can refer new customers. Take advantage of our SPECIAL FREE TRIAL OFFER. AGENTS WANTED.

Now Selling at FACTORY Prices

FREIGHT PREPAID

This is a special 30-day sale of 10,000 sheets of Edwards Steel Shingles. Our direct-from-factory prices are suprisingly low. And we now pay all the freight. Here is a great bargain—an opportunity to buy the most durable, fireproof roof for much LESS than the commonplace kind.

Edwards STEEL Shingles

outwear FOUR ordinary shingle roofs, are ten times easier to put on, and yet, THEY ACTUALLY COST LESS THAN WOODEN SHINGLES. They cost LESS, mind you.

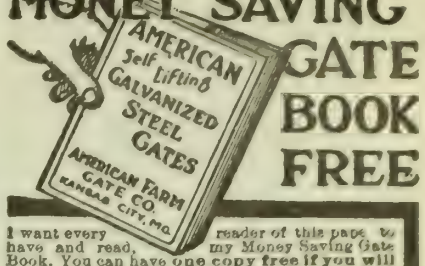
Do not judge Edwards Steel Shingles by common galvanized iron roofing—the kind that rusts. We have invented a method that absolutely prevents rust from ever getting a foothold, as 100,000 delighted owners of Edwards Roofs have found out. It's the famous Edwards Tightcote Process applied to genuine Open Hearth Steel.

STEEL Shingles Easily Put On

You don't have to nail these steel shingles, like wood shingles, ONE AT A TIME. Put on as high as 100 at once, for they come in big sheets ready to nail on sheathing or old roof. Much easier than putting on wood shingles. No extra materials to buy, no painting to do, no tools to borrow. Your hired man can do the job.

No Danger of Fire

No, Sir, you don't ever hear of any building burning up if it is roofed with Edwards STEEL Shingles. It's the man who roofs with wooden shingles or composition paper who loses by fire his house or barn.



Why risk life and valuable property when you can make your buildings practically fireproof simply by roofing with Edwards STEEL Shingles?

Every Edwards roof is guaranteed against lightning by a $10,000 bond.

WRITE! Send postal at once for our latest Roofing Book No. 2364 and Special Factory Prices. Give size of roof, if you can. (94)

WALLACE'S MAMMOTH POLAND CHINA

BRED SOW SALE, FEB. 19

AT

BUNCETON, MO.

One of My Double Expansion-Bred Brood Sows, the Best Money Making Type of Hog in America.

FROM A HERD OF 500 HEAD, that I honestly believe I can prove to you is the greatest herd of Poland China hogs in America, I have selected this Superior Offering of 85 Sows and Gilts, all Showing Safe in Pig.

I have never said so before, but now I am ready to tell you that when I began six years ago, to build the Wallace herd of Mammoth Poland Chinas I went into it with the determination to put together the greatest and best herd of Big Type Polands, not only in Misosuri but in the United States.

I honestly think I am going to offer eighty-five sows, the like of which you never saw go through one sale in all your life. I know it is an easy matter to get together thirty of forty good sows, but it is quite another matter to find one hundred good ones in one herd. This offering of eighty-five head has been selected from TWO HUNDRED SOWS that are all good ones.

Every one of these sows will be bred in the royal purple. Every one of them will be showing down heavy in pig to the service of one of the greatest quartet of herd boars that money could buy. More than half of them are tried sows that have raised one or two litters. The others are big, handsome fall and spring gilts, mostly of my own breeding, and are out of my choicest brood sows.

You must not blame a hog breeder these days for feeling a little "Swelled Up." Good hogs are better than a gold mine, with corn at forty cents, and the more a man has the richer he feels. I have sold more than one hundred boars since September 1st. They went to thirteen different states and some to South America. They put more than three thousand dollars in the bank for me. Besides this, I have fed and put off about that many fat barrows (cull boars), that went to market weighing 350 pounds at eight months old. Do you know anything that will make money like good hogs?

There is some controversy just now as to who has the most and best hogs. One man claims to have more than any other two breeders, I have no quarrel on this score. I invite you to see all the others and then come to see me. I am "from Missouri" and want to "SHOW YOU" a great herd; not the old-fashioned kind, but the new fashioned kind. The latest improved, up-to-date hog that has been bred for vigor, size and quality and beauty, not for color and spots regardless of what kind of mixing of blood it takes to get them.

I am not inviting you to come to see a lot of show hogs in elaborate show condition, but a genuinely substantial offering of the most useful, money-making kind of hogs that we know anything about. They are the kind that outgrow, outweigh and outsell all other breeds of hogs. They put over ten thousand dollars in the bank for me last year.

I ask you to come and see a herd of more than five hundred head on one farm, the produce of the greatest collection of brood sows and herd boars that money and good judgment could bring together.

The sows are not corn-fattened; they have been fed a judicious balanced ration that will insure the best results at farrowing time and help them to raise their pigs properly.

They are now safely in pig to my four great herd boars, Grand Leader, Expansion Wonder, A Monarch and Big Wonder.

I will sell them with an absolute guarantee as to health and future usefulness.

Write me at once for illustrated catalog, mentioning the American Breeder, and if you cannot come you can send a buying order to my auctioneer (Col. R. L. Harriman) in my care.

W. B. WALLACE, Bunceton, Cooper County, Mo.

N. B.—Attention is called to Bert Harriman's sale on February 18, 1913, at Pilot Grove, Mo. Parties from a distance can attend the two great sales at one trip.

early this week demand slackened and prices fell back 50 to 75 cents.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice. .	$6.65@7.50
Fair to good	5.25@6.60
Common to fair	4.25@5.20
Canners. .	3.75@4.25
Heifers—	
Choice fed	$7.50@8.00
Good to choice	6.75@7.40
Plain to fair	5.50@6.70
Common. .	4.50@5.50
Veal calves	4.50@9.75
Bulls. .	4.00@6.50

Feeders Move Readily.

Notwithstanding the break in fat steer prices demand for stockers and feeders continues active at firm prices. Extreme high sales have been less frequent than in preceeding weeks, but the average list is on a high level. Both countrymen and traders say they expect to see March prices the highest ever known. Young breeding cattle and stock calves continue high and very few have been offered recently.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.50@ 7.85
Good to choice feeders	7.00@ 7.40
Plain to fair feeders	6.00@ 6.85
Selected stockers	7.00@ 7.50
Good to choice stockers	6.50@ 7.00
Plain to fair stockers	6.00@ 6.45
Stock calves. .	5.50@ 7.50
Stock cows. .	4.00@ 5.25
Stock heifers	4.50@ 6.50
Milch cows	35.00@90.00

Stronger Hog Prices.

The hog market in the past two weeks made the highest and lowest mark of the past two months. In the past three days the general market has shown considerable strength and unable to get past the $7.50 lull to any noticeable extent, general conditions favor higher prices later. Both traders and countrymen are predicting $8 or better for the second month this year. Packers, however, are showing no disposition to let prices get that high and before 8 cents is paid there will be some curtailment in supplies. Medium and light weight hogs last week sold at a premium over heavy hogs, the weightier class being in much larger supply than trade requirements justified. Heavy hogs will predominate from now on and it is quite evident that the light weights will take the price lead. Shippers are slowly getting back in the competition and Eastern markets will draw increased supplies from Western points.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., Jan. 13.	$7.00@7.40	$7.00@7.45
Tuesday	7.10@7.52½	7.00@7.45
Wednesday	7.00@7.50	7.00@7.42½
Thursday	7.15@7.55	6.90@7.40
Friday	7.10@7.52	7.00@7.40
Saturday		6.90@7.37½

The following quotations are for hogs:

Choice, 250@300 lbs	$7.40@7.50
Choice, 200@245 lbs	7.35@7.52½
Medium weight	7.40@7.52½
Light weight	6.65@7.50
Common to fair	6.00@7.15
Stags. .	5.75@7.50
Boars. .	4.25@6.75
Bulk of sales	7.40@7.50

Sheep Prices Unsettled.

The sheep market has been unsettled in the past two weeks, and the main tendency has been downward. Compared with the middle of January prices are 50 to 75 cents lower. In the past two days about 25 cents of the decline was regained and the market is headed up again. The big movement from the Arkansas valley is under way, and the large part from the San Luis valley has been marketed. Choice lambs are quoted at $8 to $8.40, fair to good $7.50 to $8, common to fair $7 up, yearlings $5.50 to $7.50, wethers $4.50 to $5.50, and ewes $4.25 to $5.15.

January Live Stock Receipts.

Receipts of live stock at the five Western markets for the first month this year were short on cattle, hogs and sheep. Hogs decreased 369,000, or 17 per cent; cattle, 70,000, and sheep 131,000. Cattle and sheep made a better showing than was expected, and hogs were fewer than expected. St. Louis showed an increase in cattle, and Omaha an increase in sheep, but all other points reported decreases. The combined receipts of cattle at the five Western markets in January was 642,650, and hogs 1,775,900, and sheep 935,250. But for the liberal supplies marketed from below the quarantine line 5 per cent fewer cattle would have shown up at river markets. The shortage in hogs is the result of the recent large losses from cholera, and a general scarcity of hogs in the country. All markets showed about the same relative decrease, indicating that no one section of the country suffered greater losses than another.

SWEEPSTAKE 28006 WEIGHS 1,200 LBS. FIRST AND CHAMpion boar at Iowa, 1912, heads our herd of Chester Whites. WE SHIP C. O. D. AND PAY ALL EXPRESS CHARGES. Choice, growthy pigs of both sex, no akin. Catalog free. We also offer for sale recorded Shire fillies and mares in foal. Address, B. M. Boyer & Sons, Farmington, Iowa.

CENTRAL SHORTHORN BREEDERS' ASSOCIATION.

To the American Breeder: This letter is intended for all Shorthorn breeders who have any interest in the Central Shorthorn Breeders' Association and desire its meetings continued. This association was the outgrowth of the Missouri and Kansas Shorthorn Breeders' Association and under its present name has held fourteen annual meetings, most of which were successful and useful.

During the late years the attendance has been small and the benefit of these meetings restricted. Last year no meeting was called because of the ill health and absence of the secretary. The president of the association, Hon. A. C. Shallenberger, and others are very anxious to have the meetings continued and a greater interest in Shorthorns awakened.

With the hope of realizing this desirable result, a meeting is hereby called for Tuesday and Wednesday, February 11-13, 1913, in the hall of the Stock Yards Exchange Building, Kansas City, Mo. Will you not come and help put new life in this association? This is absolutely necessary or it will be abandoned. B. O. Cowan, Secretary, Chicago, Ill.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

JOHN R. TOMSON, Dover, Ks.

My herd of Shorthorns are now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

NEVIUS' SHORT-HORNS AND POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, - CHILES, KANSAS

GOOD SHORTHORNS

Reds and Roans.

1 car load of bulls for sale.
1 car load of heifers for sale.
These are rugged, blocky, good feeders—the kind the country needs.

H. C. Lookabaugh, Watonga, Okla.

AUCTIONEERS

MAKE BIG MONEY.

There's a School
THAT SHOWS YOU HOW.

Next Term Opens August 4 and Lasts Four Weeks.

THIS IS THE BIG TERM FOR ACTUAL PRACTICE IN SALES.

Tuition remains the same, $50 down and 25 per cent of the first $200 you make out of auctioneering.

or cash. Smooth 160 acres Western Kansas land, worth $3,000 and good city residence worth $1,600; town of 4,000. Will sell either property and take good Shire stallion as part pay. Address, **Box 327, Dighton, Kas.**

BARGAIN IN A 320 ACRE FARM.

For sale or exchange, within seven miles of good railroad town and 250 miles of Chicago, in central Wisconsin, fine black loam, clay subsoil; good water; 2000 cords of wood; diversified farming; crop failure unknown; greatest dairying country in the world; $22.50 per acre, one-fourth in live stock, one-fourth cash, and balance on time at 7 per cent. Address 215 Reed Street, Red Oak, Iowa.

Southwestern North Dakota Grain and Stock Land.

1,120 acres; 95 per cent plow land of deep chocolate loam. Very productive and unsurpassed for retaining moisture. In all prairie, what you want. First crop of flax on new breaking will net you $8 to $15 per acre. Price, $25 to $28 per acre. Will take for half of payment pure bred horses. Percherons preferred.

Also one of the finest 640 acre farms in the famous Durum wheat belt, Lamoure County, N. D. 540 acres of this is plowed. Write me for further particulars, stating what you have to offer.—**W. G. Fick, Verona, N. D.**

IRRIGATED FARM LAND

With an Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southeast Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Oats yields 30 to 80 bus.; wheat, 20 to 60 bus.; barley 30 to 80 bus.; potatoes 150 bushels and up; beets highest sugar content; alfalfa 4 to 6 tons per year and all grasses do well.

The climate here is exceptionally good.

Mining towns make good markets. Eggs average 30c; butter never less than 30c; oats $1.25 and up, per hundred; wheat, $1.50 and up, per hundred. For good values in land, or any reliable information, write

W. L. Morse, Mancos, Montezuma Co., Colorado.

Management of Brood Sows

Feed and Care During Gestation. Special Ration Requirements For Gilts. Exercise, Ventilation, Lice and Worms Among the Things to Be Considered.

Written by John M. Evard, Iowa Experiment Station.

To produce strong, healthy litters it is not only necessary that the sows be fed correctly upon feeds that furnish sufficient muscle, bone and energy making materials, but that they be handled wisely during the period of gestation.

The mother sow needs food for three important purposes: First, for her own maintenance; second, for growth on her own body; and third, for the nourishment of the fetal pigs. Corn lacks muscle and bone formers and in addition is too concentrated (not bulky enough for breeding swine). Tankage, meat meal, linseed oil meal, skim milk, buttermilk, bran, oats, middlings, shorts, soy beans, clover and alfalfa are the logical supplements to corn in the middle west. At the Iowa station we have found that most excellent rations for gilts carrying litters are:

1. Corn 88 to 90 per cent, meat meal or tankage containing sixty per cent protein, 10 or 12 per cent.
2. Corn 75 per cent, finely cut clover or alfalfa 25 per cent.
3. Corn 80 per cent, oats, chopped clover or alfalfa 10 per cent, meat meal or tankage 10 per cent.

For old sows the proportion of meat meal or tankage can be cut down practically one-third to two-fifths and still get excellent results.

Stronger, healthier litters having more hair, more color and more bone have been the result whenever we added a suitable protein and ash supplement to corn. When we selected our supplements wisely we also got cheaper pigs. At present prices for purchased protein and ash supplements, meat meal and tankage are our cheapest sources.

Above all things, excepting the food supply only, an abundance of exercise is most important. All classes of pregnant animals do well only when abundant opportunity for exercise is allowed. The general tone and vigor of the mother is reflected in the offspring; the better the general health and condition of the dam the stronger and more vigorous the young. Range on pasture is perhaps the best of all. Allow the sows to follow cattle for a while, but be sure to remove them when they tend to become clumsy and heavy. Scatter the feed over the ground, such as sheaf oats, soy bean hay, etc., and let the sows gather it. Feed on the side of the field opposite the sleeping bunks. Allow hay in racks, the eating at which is conducive to light exercise. Shut the sows from the houses in the middle of the day rather than allow them to huddle up and snooze peaceably. Schemes to induce exercise cost little, yet the returns are considerable.

Warmth, dryness, ventilation and sunlight are the essentials of an ideal hog house. Such conducive conditions can be secured with a little forethought. Good, dry bedding is needed and to be kept dry must be changed regularly. Arrange the houses so as to avoid draughts and heavy winds, preferably placing them in sheltered nooks. Although the hog can stand considerable cold yet the breeding hog does not have the fat which would ordinarily keep the fat hog warm, neither does the breeding sow have such a warm coat as the horse, for instance, that roughs it. We have found in our experience that sensible shelter saves many cents.

We hog men cannot afford to feed our hard earned corn and other grains to lice and worms. Crude oil is cheap, costs not more than $4.00 a barrel, is easily applied and does the lice up brown and black, hence why hesitate. It kills the nits at one application and can be used in winter because it is an oil and does not evaporate. An old broom, a sprinkling can and a couple of hurdles handled by two active men is sufficient equipment for ridding the farm of hog lice.

Worms are a serious drawback. I know of no better remedy than Santonin 6 grains, calomel 4 grains to a hundred pounds of hog given once on an empty (12 hours off feed) stomach and repeated in 10 days if necessary. It is not well to use any worm medicine upon sows within a couple of months of farrow, because all pregnant animals in advanced stages have some tendency to abort when given a strong laxative. The thing to do is to tend to the worms in time.

Laxativeness of the bowels is highly desirable as costiveness is a menace. Plenty of exercise combined with laxative feeds such as tankage, oil meal, bran, alfalfa, hay, etc., will largely solve the problem. However, if it does not, a week before farrowing an emergency remedy of an ounce of Epsom salts per hundred pounds of hog will help considerably.

The essentials of brood sow management may be briefly summarized: Provide suitable food, but do not overfeed. Emphasize the protein and ash constituents. Keep the sow growing nicely but do not fatten. Devise schemes to induce exercise. A dry, warm, well ventilated bed in a sheltered house is in order. Kill off the lice and drive out the worms because you cannot afford to feed parasites. Avoid constipation by natural feeding management, but resort to emergencies if necessary. Practice gentleness with your brood sows, speak kindly in their presence, recalling always that good treatment bespeaks contentment with its corresponding profits.

MISSOURI ASSOCIATION OF COUNTY FAIR MANAGERS.

The annual meeting of the Missouri Association of County Fair Managers was held in the Agricultural Building at Columbia, Mo., on January 15, 1913.

A live stock classification for county fairs, prepared by the secretary, will be sent free for the asking. This classification was prepared that there might be a uniform distinction between the different classes and each class so clearly defined that the awards properly made would fix in the mind of the spectator the requirements for each class.

The association prepared a bill at this meeting to promote and foster fair associations in Missouri, to establish a fair commission, so that all fairs shall become educational and auxiliary, and providing for the payment by the state of 40 per cent of all certified premium lists; and appropriating the sum of $60,000 therefor. This bill was turned over to a committee on legislation to be introduced in the General Assembly now in session.

The officers elected for 1913 are as follows: President, J. Allen Prewitt, Independence, Mo.; vice-president, Jack Harrison, Auxvasse; treasurer, B. E. Hatton, Columbia; secretary, B. A. Trowbridge, Columbia.

WE'RE EATING MORE MUTTON; RESULT.

Increasing consumption of mutton in the United States has been stimulated by the relatively lower prices for that kind of meat than for beef and pork.

In 1912 about 15 million sheep were marketed at the twelve principal Western markets, about one-half million more than in 1911. About three-quarters million fewer sheep were sent back to the country for feeding purposes than in 1911, making an increase in the number slaughtered in 1912 of about 1¼ million.

Increased slaughter has reduced the flocks of the West materially and now sheep prices are the highest ever known in January.

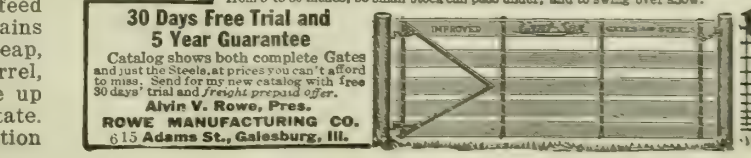
"Can't-Sag" Gates Save You BIG MONEY

Cost only one-third as much as ordinary iron, wire or gas pipe gates, but last twice as long. Neat in appearance—best and strongest gate made—light, easy to handle, opens both ways. Boards are double bolted between eight angle steel uprights and double truss braces. *Guaranteed never to sag.*

Cost Less Than All Wood Gates—Last 5 Times as Long



Can't Sag Gates are furnished complete, ready to hang, or just the Gate Steels which include everything except the boards. Patent self-locking hinge feature—reinforced two piece malleable hinges. Six Triangular Truss Braces make gates extra strong.

Improved Elevating Attachment permits the gate to be raised full length from 5 to 30 inches, so small stock can pass under, and to swing over snow.

30 Days Free Trial and 5 Year Guarantee

Catalog shows both complete Gates and just the Steels, at prices you can't afford to miss. Send for my new catalog with free 30 days' trial and *freight prepaid offer.*

for sale. Five years old; weight 1,900 pounds; registered; sound; sure; gentle. Will give terms, or trade for young stock. **F. P. Anderson, Morrisonville, Christian County, Ill.**

QUESTIONS AND ANSWERS.

Continued From Page 5.

ters. What will relieve one case of rheumatism will have no effect upon another, yet ordinarily half ounce doses of salicylate of soda three times a day will help the average case in from ten days to two weeks, and if the case is recent often improvement can be noted earlier. It is well to use agents like iodide of potash, giving one dram in the drinking water three times a day. Do not give it in the feed. This may be alternated every other day with four ounces of sulphate of magnesia twice a day which may be dissolved in a small amount of warm water and given by means of a two ounce syringe by the mouth.

BROKEN WIND—Is operating on a horse, cut in the wind, a success?—Ohio Subscriber.

REPLY—As to whether or not relief will follow an operation for broken wind depends on the nature of the affection sought to be relieved. Roaring can be relieved in the majority of cases by operation.

INJURED WITHERS—About six weeks ago a stallion playfully chewed the withers of a coming two year old filly, getting loose during the night. Withers swelled largely and finally broke on either side and apparently the parts bruised literally rotted away, leaving a raw sore on either side about eight inches long and two inches wide, from which a great deal of puss is constantly emited. Is this likely to be an incurable running sore, or, if healable, what treatment would you prescribe?—Utah Subscriber.

REPLY—You need the services of a competent veterinarian to successfully handle a case of this nature, as it is very likely some of the ligaments are injured and surgical treatment will be needed. If neglected there will very likely result a case of chronic fistulous withers.

INJURED EYE—Five months ago a groom hit my young horse in the eye. The eye swelled badly and then swelling went down. Since then it swells around the eye every few days and the eye waters badly. No signs of injury to the ball only the lid below. Give suitable wash and treatment.—Ohio Subscriber.

REPLY—Apply a large, clean pack to the eye and keep frequently wet with ice water for a number of hours. Do this often as necessary to relieve the inflammation. Use a saturated solution of boracic acid in the eye three times a day.

INJURED COLT—I have a two year old light harness colt that has a very strange way of handling himself. His trouble came on him in the month of September while on pasture. He drags one front right foot almost every step. The other front foot he seems to handle all right. His hind parts are affected in both limbs, but more especially his right leg. When you attempt to back him, he will swing his body back as far as he can and then drag his hind feet afterwards. This colt was worked in the spring of 1912, was turned out to grass in May and was not taken up until the latter part of November. He eats hearty and has maintained his flesh both on pasture and since. He ran as a stud until after this trouble came on. About the middle of November I had him castrated and he is well of that, but his other trouble is no better. Twice in the past two weeks he has had to be helped up. He just seems to be partly paralyzed. Our local veterinary says he has cerebro-spinal meningitis. But it does not compare with some other descriptions of that disease. He says that nothing but nerve tonics can be given and that is uncertain as to results. If you can gain from the description what the trouble may be, please advise what to do.—Indiana Subscriber.

REPLY—We fear your veterinarian is in error concerning the nature of the trouble with your colt. We suspect he has been injured in some way and that the difficulty is in the region of the shoulder. The peculiar action of the hind limbs is very likely due to the injury in front. Why not ask your veterinarian to call in some good, competent graduate to advise in consultation, as a personal examination is necessary before any one could prescribe intelligently.

RETAINED AFTERBIRTH—I have had some trouble with the retention of the afterbirth in my mares. Can I feed in any way so as to assist nature

DISPERSION SALE

35 Percherons, Pure Bred and High-Grade, 3 Jacks, 1 Standard Bred Stallion and Our Entire Plant, Land, Buildings and Equipment

Neal, Kansas, February 15

The Percherons Include: 5 stallions headed by the imported horse Tatius (45938) 29483; a 3-year-old, weight 1600; a 2-year-old, weight 1500; a yearling, black, weight 1500, and a weanling, black, weight 1000.

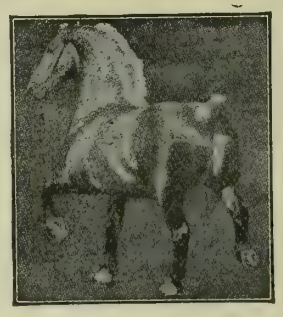
25 Mares—1 span imported Percherons, 6 and 7 years, weight two tons; 1 span three-quarter blood black Percherons, 3 and 5 years, weight 2800 pounds, bred to Imp. Tatius; 1 span black three-quarter blood Percherons, 5 and 6 years, weight 3000, bred to Tatius; 1 span gray ¾-blood Percheron, weight 3100, bred to Tatius; 12 other grade Percheron mares, 5 to 9 years old, all bred to imported horses.

The jacks are good ones; 4 to 7 years old; 900 to 1100 pounds; one of them cost $1000.

The roadster stallion is standard and registered; bay; weight nearly 1200; a good combination horse.

Tatius the Old Stallion is a great horse and a great breeder. His colts of all ages will be there to show. He is strongly Brilliant bred, as are all the Percherons.

The Plant is a good one, well equipped (21 lots, barns and dwelling house) and will go to the highest bidder. This is a good locality and our business has been a money maker all the time. Am selling only on account of health.



Write us for complete sale list of stock.

AUCTION SALE

OF PERCHERON AND BELGIAN STALLIONS

AT CARROLL STOCK PAVILION AT 1:30 P. M.,

TUESDAY, FEBRUARY 11, 1913.

(Four Belgians; one Shire; balance Percherons.)

We will sell 25 head of stallions ranging from two to five years of age; all blacks, greys and bays. A few of these are high class grades having several crosses of pure blood and will make ton horses. Our horses are pasture raised and possess big bone and size, combined with quality and action.

We showed our horses at the Nebraska, South Dakota and Sioux City fairs in 1912, and won 18 prizes. These horses have been inspected under Nebraska stallion law. Carroll is located on the C. St. P. & M. & O. Ry., 60 miles west of Sioux City, Iowa, and 120 miles northwest of Omaha.

For Particulars, Address

BURRESS BROS.

THE BEST VALUE.

Home grown registered Percheron stallions of substance; 2 and 3 years old; grays and blacks. Big straight fellows that will pay you. It is worth a stamp and a moment's time writing to know about these. South Central Iowa.

Fred Chandler, Route 7, Chariton, Ia.

PERCHERON STALLION

for sale. Dark brown; 16½ hands high; good breeder. Colts to show. Broke to work single or double; sired by the imported stallion, Payson (45466) 25937, dam, a very high grade Percheron mare. Priced to quit business.

Will take a good Shorthorn, Polled Durham or Red Polled bull as part pay. **E. L. Jones, Forgan, Beaver County, Okla.**

STALLIONS FOR SALE.

One 6-year-old black Percheron; weight 2,212 pounds, in breeding condition, with good style and action.

One dapple gray Percheron, 6 years old; weight 2,110 pounds; got the best action of any draft stallion his weight; lots of quality and good colts to show. Am offering these stallions because I have adopted the capsule system and have them to spare. **Henry Dreher, Cedar Rapids, Boone County, Neb.**

in this at foaling time?—Colorado Subscriber.

REPLY—A mare should be fed a rather laxative diet during pregnancy, especially the last six weeks or month of gestation. At this time some alfalfa hay is in order and a small amount of old process linseed meal should be fed with the grain. Start in with a tablespoonful and gradually increase until a handful may be given. You will find by giving this attention you will have less trouble.

LOCAL ITCHING—I have a fine registered horse and at times he takes spells of gnawing or biting himself on the stifle joint and also on the elbow. When he is biting himself he will jump and go around as if he had pain. He keeps himself sore.—Texas Subscriber.

REPLY—See that this animal is given opportunity for regular exercise and is not fed too highly on heating grains; also that his stall is kept in a sanitary condition and no filth permitted to accumulate on the body. Apply to the parts affected three times a day a solution containing eight ounces each of witch hazel and alcohol to which one dram of lysol has been added. Give internally one-half ounce of Fowler's solution in the feed three times a day.

INFECTED PENIS—I have a large Percheron stallion, 11 years old, very active and served eagerly all through season. Never more than two mares a day. After end of season I noticed a sort of rash or skin pealing off all over penis and when a mare was brought to serve he was eager to tease and mount, but it seemed sore and he dismounted without having entered. I led him around and in a little while let him mount again. This time he entered a few inches and discharged, but it seemed to hurt and the penis softened very soon and fell limp. Upon examining mare it was found that he had deposited a thick gray discharge that resembled thin well cooked oat meal, white. Have noticed nothing wrong with him since but have bred no more mares. He is feeling fine and is eager after mares as ever. What is the matter with him, if anything? How can I get him to put out his penis so that I can wash him if it is necessary? He seldom does of his own accord. I notice that it has a sort of cheese on it, but isn't that common to all stallions when not used for breeding?—Minnesota Subscriber.

REPLY—Your stallion was perhaps suffering from an infection, possibly genital horse pox. You should cleanse his sheath with a warm bran mash, using a one-half of one per cent lysol solution to rinse the same. It is not necessary to have him extend the penis in order to cleanse the parts, but by bringing a mare into his presence may help if this is desired.

PURPURA HEMORRHAGICA — I have a mare four years old, never has been worked, or used, on pasture most of time, always been healthy, that came up four days ago with her legs swollen to almost double their size, clear up to her body and body was swollen some, running at the nose a watery discharge, her respiration was labored and she seemed to have a cold, she stood with her head very low to the ground, was very stiff and seemed like she was in great pain. She would not eat, but drank water freely, though difficult for her to swallow, bowels acted well and she did not seem to have fever. A Mexican here applied lard to the swollen legs and then rubbed them with hot bones. He then gave her a good osteopathic treatment and she seems a little better. I never saw anything like it and wish to ask you if you can tell me what is the matter with her and what should I have done for her?—New Mexico Subscriber.

REPLY—Your animal apepars to have a blood disease called purpura hemorrhagica. Give laxative, nutritious diet and give one dram of the fluid extract of nux vomica every three hours.

CHOKED HORSE—We have a horse that was choked about four weeks ago. The veterinary probed her throat with a hose and her throat has been sore ever since. There has been a discharge at the nostrils and when she eats grain some of it works through the nostrils. What can I do for this horse?—Ohio Subscriber.

REPLY—About all that can be done at this time is to keep the animal on soft non-irritating food, as very likely the region of the throat was wounded during the attempt at relief of the choke.

ABORTION—I have a Jersey cow

A BREEDER'S SALE

of

Percheron, Belgian and French Draft Horses

On Thursday, February 20, 1913,

at State Fair Grounds, Lincoln, Neb. Positively no pontponement (rain or shine).

32 HEAD OF STALLIONS AND MARES—32

As good if not the best offering that will go through any sale ring this year.

10 mature stallions, 10 mares, 2 two year old stallions, 3 two year old fillies, 7 weanlings.

From the studs of Wm. Parr, Ruskin, Neb.; J. C. Day & Sons, Superior, Neb.; Frank Davidson, Ruskin, Neb.; Geo. Barber, Oak, Neb.; L. Wall, Ruskin, Neb.

Catalogues now ready. Send for one, mentioning the American Breeder.

PERCY BAIRD CLERK, RUSKIN, NEB.

Col. F. M. Woods, Auct.

I AM CLOSING OUT on account of my health and age.

Here are the Bargains:

One imported dapple gray Percheron stallion, weight 1985 pounds; foaled in 1903; good and sure breeder and easily handled; colts to show. His registration numbers are (59513) 57977.

3 good young jacks, all Mammoth bred; black, with white points; all broke and quick servers. One is 3 years; 16½ hands, standard; weight 1165; very lengthy; 9½ inch bone; 16 inch foot; 56 inch head; 35 inch ear; a herd header. One is coming 3 years; 15½ hands, 9½ inch bone and will make a good herd jack. The other (same age) is very heavy; broad backed, wide out and square, with a 10 inch bone in front and 12 inch behind; 14¾ hands.

6 good jennets; 1 to 8 years old; 14 to 15½ hands; all bred that are old enough.

Would take good cattle or mules on a trade.

G. B. WEAVER, ROUTE 1, HARRISONVILLE, MO.

SEE OUR STALLIONS

BEFORE YOU BUY.

Percheron, Belgian and German Coach.

Our last importation arrived December 28. These with the select lot on hand enable us to offer for inspection at this time a great collection of stallions of strong individuality, rare quality and standard breed types. **There are yours at bed rock prices. OUR GUARANTEE is different to that offered by any other firm.** It will pay you to investigate it if you contemplate the purchase of a stallion.

Mention American Breeder when you write.

EMPORIA, KANSAS

HOMEWOOD STOCK FARM

Percheron, Belgian, Shire Stallions and Mares

Now is the time to buy a good stallion or mare. We have the kind you have been looking for. Our horses arrived home in October and are now perfectly acclimated and in the best of condition to do you a lot of good.

The Percherons are two and three years old, with size, bone and draft horse quality—many of them weighing over a ton, and not fat.

Our mares are of the best brood type; all are in foal and plenty of ton mares to select from. Every animal guaranteed sound, and a satisfactory breeder. Others say we have the best bunch of two-year-old Percherons they ever saw; you will say the same. Come and see us or write for full particulars. You will find horses right, terms right and prices below others of equal merit. We have also a lot of big, heavy boned, American bred stallions at surprisingly low prices. Don't buy until you have seen our stock.

Homewood is on the main line of the Big Four and I. C. R. R., twenty-three miles south of Chicago. Trains hourly to and from the city.

ALEX GALBRAITH & SON :-: DE KALB, ILLINOIS

Formerly of Janesville, Wis.

that has aborted twice in the last year and a half. The last abortion was one year ago. They would occur at four and one-half to five months and she is three and one half months advanced now. Please tell me what to do to tide her over that period.—New Mexico Subscriber.

REPLY—Abortion is difficult to overcome in cases that become chronic such as you have. Try two drams of the fluid extract of black haw in the feed twice a day, and as you near the time when she aborts, increase to one-half ounce twice daily.

HIDE BOUND—I know of a horse in my neighborhood, that is five years old, is poor, has rough hair, poor appetite, dull appearance and does not eat hearty. Some of my neighbors say he is hide-bound. Is there any such thing as hide-bound? If so, what is the remedy for the disease? —Tennessee Subscriber.

REPLY—A horse may become emaciated and unthrifty from various causes resulting in the skin becoming harsh and tight on the body. The treatment is in the direction of overcoming the cause of the condition, such as correcting the disease producing it, noting the condition of the teeth, etc. The animal should be placed on nutritious feed, with plenty of grooming and such remedies given as will promote a better state of thrift.

FOUL SHEATH—I have a Percheron stallion seven years old. The right side of his sheath is about twice as thick as the other side for about three inches at the bottom. When I first noticed it about three months ago the sheath was frothy at the bottom. I supposed he had a foul sheath and cleaned him out with warm water and bran; in two or three days I washed it with salt water. This I did nearly every day; sometimes using cider vinegar instead of salt water. It got some better at the start, but now stays about the same. I cannot see any sore nor feel any on the inside. He is in good shape and feels well; serves a mare as quick as ever. When he is left a few days without washing out it gets pretty bad; it looks like it was swollen a little up close to his belly, but I can feel nothing. His tail looks nice and his testicles normal. What can be the matter and what would you advise me to do. I can run my hand and a wet rag clear up on the inside and it does not appear to hurt him. The sheath seems a little hard where it is enlarged.—Nebraska Subscriber.

REPLY—We would infer from your description that this animal's sheath has been foul and that there must have been considerable inflammation of the skin lining of the sheath, as evidenced by the exudation. Use a one-half of one per cent lysol in the bran when washing and when the sheath has been cleansed apply a solution of sugar of lead to the interior of the sheath, using a solution containing one ounce to a quart of water.

DISCHARGE—On the 27th of July I noticed in the stall of my imported stallion a discharge of white stuff, not like semen, but tougher and more stringy. I had a licensed veterinary to treat him for four weeks and I did not let him serve any mares in that time, but I do not think it did him any good. After the four weeks I commenced letting him serve mares again and he still drips white looking stuff. This stuff does not smell bad for the horse is not sick, always feels good and will get ready and serve a mare just like he always did and the strangest thing to me is, nearly every mare he served after that four weeks got in foal. What will I do about this? Will the horse ever come right again? He is an excellent breeder. I have been careful not to breed any diseased mares, as I examine nearly every mare that hasn't a little colt by her side.—Ohio Subscriber.

REPLY—Your veterinarian should submit the discharge to a microscopic examination in order to determine its character and source, which is the

only way to determine whether or not it is harmful to the animal.

LEAKING NAVEL—We have a lot of trouble with leaking at the navel. How could we prevent that? Or what treatment should we give it? I stand a horse and my patrons are eager to find out some remedy.—Nebraska Subscriber.

REPLY—Nearly every leaking navel is an infected navel and the secret of successfully handling these cases is in way of prevention. Owners of mares should be extremely careful that clean places freshly bedded with bright straw are provided at foaling time, and that a prompt plan of systematic disinfection of the navel of every colt be made a part of the work. If this is faithfully persisted in the complaints of navel ill will largely subside.

INFECTED NAVEL—I had a mule colt foaled in 1911 that died in less than two days from something wrong with its kidneys. Its urine was bloody. In 1912 I lost another mule colt from the same mare and same jack with the same disease. Can you tell me the cause and if there is any cure or preventative? They seem to be all right at first with the exception of the bloody urine.—Missouri Subscriber.

REPLY—Your mule colt died of an infected navel which extended to and involved the bladder. Treatment for these cases lies in prevention by arranging for the mares to foal in scrupulously clean places, and repeated applications of antiseptics to the navel of the foal for several days after birth.

DRENCHING PREGNANT MARE—What effect will it have on a mare, that is with foal, to drench with a quart of linseed oil and two ounces of turpentine?—Kansas Subscriber.

REPLY—Drenching any animal with a large dose of any agent, particularly linseed oil, is a hazardous undertaking for the reason that some of the medicine may pass into the trochea and produce an intractable case of pneumonia. One should be very guarded about giving purges to pregnant animals for the reason that abortion may be induced by their action.

BLEEDING—Why do some horses and jacks bleed at end of penis during service? Does this affect them seriously?—Texas Subscriber.

REPLY—Hemorrhage is usually induced by a rupture of some of the small vessels within the urethal canal. Occasionally there are ulcerated spots along the course of the uretha and inasmuch as the penis is surcharged with blood at the time of copulation, it will be appreciated that hemorrhage occurs easily. As a rule these hemorrhages are only slight and do not produce serious harm, but should not be ignored in bad cases.

FOUNDERING MULE—I have a mule that is nine years old, weighs 1,100 pounds, that has a chronic founder, was foundered three years ago and is lame at times and goes lame every time I have her shod. The sole of her foot is too low and it can't be cut down. Is there any way to cure it or even give her present relief? She is in good flesh, healthy and feels good.—Arkansas Subscriber.

REPLY—Cases of chronic laminitis are difficult to treat but for service should be improved by proper shoeing. The general principles lie in applying a shoe that rests upon the wall and frog—bar shoe. Let it be shaped so that it will be off the roller motion pattern, and when set be placed back a little so as to shorten the toe a little. This will enable the animal to break over easily. A sole leather pad should be applied under the shoe for the purpose of protecting the sensitiveness of the sole, the irregularities being carefully packed with pine tar and oakum for the purpose of keeping out the dirt as well as to aid in keeping the horn soft.

VARIOUS QUESTIONS—I have a colt seven months old that has a bunch on its stifle about the size of a man's fist. It came there when the colt was about one week old. It also has the diarrhoea. I am feeding shreded corn fodder, a little alfalfa hay, one quart of oats, one quart of bran and a double fistful of flour once a day. Bran and oats three times a day. When I leave the flour out the colt gets awful loose and as long as I feed the flour the colt seems all right. I also have a four year mare that throws her stifle out ever few weeks. When I find it out she is standing in the barn and it will not stay in until I turn her out for four or five hours. Is there any cure for this or will it always bother?—Ohio Subscriber.

REPLY—You need a veterinarian on the ground to help you out. The growth may be the nature of a tumor, in which case it very likely can be dissected out. Again it may be an enlargement due to distention of the capsular investment of the joint which would be a more difficult condition to treat. You should discontinue such food as tends to disturb the bowels of the colt, such as silage, bran and alfalfa hay. Feed good clean oats and flour and the best of prairie hay. These conditions are chiefly corrected by careful attention to the diet. A cantharides blister applied to the stifle of the mare bothered with displacement of the patilla every three weeks will have the effect of strengthening the parts and will perhaps overcome the trouble in a few months. You are located in a state where veterinarians should be accessable.

INCREASING JACK SERVICES—We have a very good jack and about 20 head of mules. This country is, however, not educated to the value of mules and therefore I wish to ascertain whether the jack (six years old next spring) would benefit by serving more mares. Last season he served about forty times during the season, with no more than one service a day and sometimes would stand a week without a single mare coming to him. Ought we arrange to give him a service every two or three days during the season, or are these stretches of a week or ten days a benefit to him? We are unable to state that he abuses himself and have found no symptoms, and while he serves every mare brought, the time varies from 15 to 45 minutes. He will serve much quicker the day following a service than he will the first service after a rest of a week or ten days.—Wisconsin Subscriber.

REPLY—If you wish to increase patronage of this jack, get a few extra good mule colts and keep them where the farmers can see them and

Pioneer Stock Farm

We have on hand at all times Percherons, Belgians, Shires and German Coach stallions and mares; imported and home bred stallions and mares weighing up to a ton or better. JUNKENS & O'NEIL, 15 North Hazel St., **DANVILLE, ILL.**

W. A. LANG & CO.

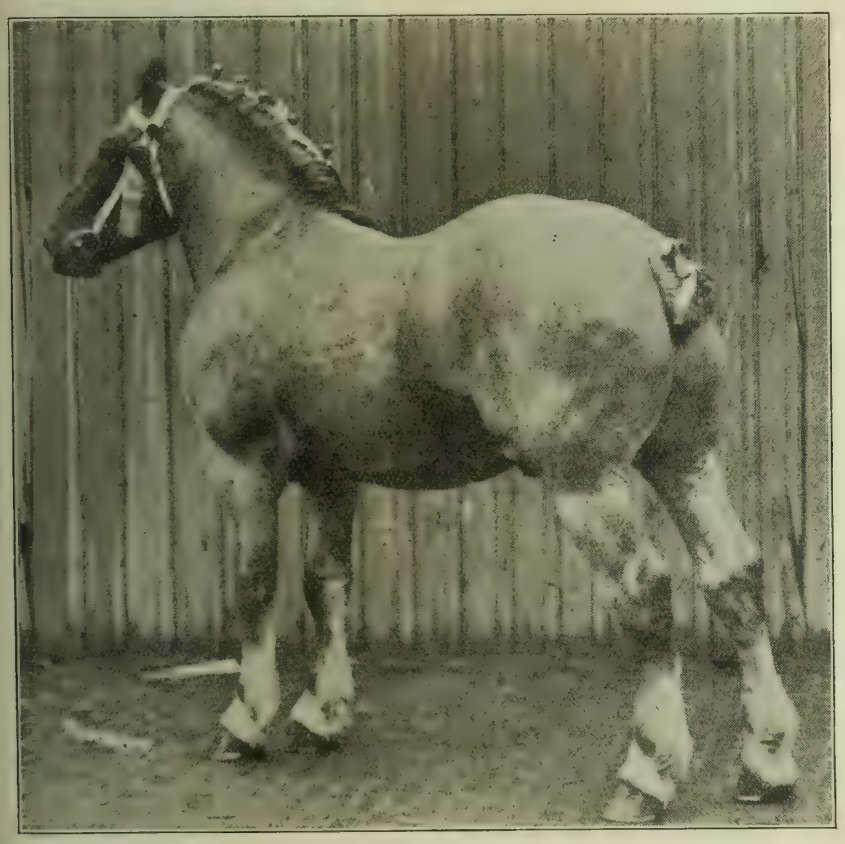
Greeley, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS and MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible, and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars, mentioning this paper.

tell them what these colts are worth at weaning time. There are a lot of mares in every community that will not raise profitable horse colts that can be bred to a jack and give a better margin of profit. Of course the better the mare the better the progeny will be. Your jack could double the number of services very easily, but we would not advise arranging for extensive service without further compensation. Do not allow your jack to run in the same yard where the breeding and teasing is done.

COLLECTING SERVICE FEES—I have a very fine pacing stallion and use him for breeding purposes and advertise him stating that all parties disposing of mares after being bred to my horse, forfeits insurance which is due at time they part with the mare. Now I have collected one claim this winter without any litigation, and have two others to collect. One of them keeps putting me off and the other one wrote me a bad letter stating he would not pay insurance until the mare had a colt, and he did not think she would have a colt, but when he traded her off he claimed she was with foal, and he made a good trade by her being with foal. That mare was a dangerous mare to breed. He also told me that the parties and he had an understanding that they would tend the season with the mare, and he was to give $75 for the colt at weaning time. The mare never was returned to the horse; now according to the laws of Ohio, can I collect this claim? This man is plenty able to



(Continued on page 17.)

HORSE BREEDING WITH CAPSULES.

Practically every line of business is adopting new but yet tried improvements. Every line of business that prospers must keep up with the times. The use of capsules is a great benefit to the mare owners as well as stallion or jack owners. Mares may be assembled at any advertised hour so that every one interested will know when a service can be had. Sometimes it is not convenient to take a mare to the horse on a particular date, but this method offers an opportunity to take the mare on the following day. It is not necessary to make dates as it is with the natural service.

Many good mares are injured by an excess of service, so that the per cent of foals will be small, but with the capsule service it is only necessary to make one service a day to breed all the mares in the community. With this number of services it is impossible to injure a matured stallion and he will discharge live spermatozoa at each service as a rule. When a stallion discharges fertile semen, one drop contains so many spermatozoa that it is impossible to count them all. It only requires one spermatozon to get one mare with foal, so that a single discharge of the stallion may be divided up into many capsules and breed a large number of mares at one service, with better results than can possibly be had with the natural service. There are many mares that have a closed cervix that will not permit the semen to enter the womb, where it must be deposited before fertilization can take place. These mares will not get with foal by the natural service (no matter what kind of a stallion or jack they may be bred to) without some assistance. When stallions are not bred excessively, the colts have more vitality and a greater per cent of them live and make good horses. The capsule system is well established. Thousands of breeders are using it successfully.

We are publishing a few statements from breeders giving their experience with this method of breeding. We will print the names and addresses of these individuals so that any ones doubting these statements may go and see them and visit the mare owners and find out for themselves whether it is a

Send Coupon for "Horse-Trainers' Book" FREE

Prof. Jesse Beery, known from one end of the country to the other as the World's Master Horseman, having retired from the arena with an independent fortune, is giving the world the priceless secrets of his marvelous success. A copy of his wonderful "HORSE-TRAINERS' PROSPECTUS" will be mailed, free of charge, to all who are ambitious to master this highly profitable and intensely interesting profession.

Vast Audiences Thrilled by Beery Exhibitions

The thrilling exhibitions given by this King of Horse-Tamers and Horse-Trainers have never been equalled. His mastery of fierce, man-killing stallions, without whip, curb bit or other cruel devices, has astounded the world. The most unruly horses—kickers, tricksters, balkers—subdued while multitudes watched, wondered and applauded. Medals, trophies and honors of all kinds, showered upon Prof. Beery by admiring thousands, bear eloquent testimony to his matchless skill.

Learn Beery System by Mail, at Home

The Beery Correspondence System of Horsemanship is the only instruction of the kind in the world. The lessons are simple, practical and complete. Learn in spare time, right at home, to take the most vicious horse and subdue him in a few minutes. Prof. Beery can teach you how to break any horse of bad habits—teach a horse to drive without reins. How to tell the disposition of any horse on sight—judging a horse right the first time! How to cure shying, kicking, biting, balking, fear-of-automobiles-and-trains and all other bad traits forever.

Bang! Bang! Bang! "Who's Afraid?"

Break a Colt in 8 Hours!

The lessons in Colt-Breaking alone are worth the price of the entire course. You can train a colt, in 8 hours, to be absolutely trustworthy. There is big money in breaking colts and curing horses of bad habits.

Graduates Making Big Money

The success of Prof. Beery's graduates is remarkable. Big demand everywhere for competent horse-trainers. Many graduates making $1,200 to $3,000 a year. Owners pay $15 to $25 a head to have vicious, dangerous, tricky horses cured of bad habits and colts trained properly. Many graduates own profitable training stables. Others making all kinds of money buying cast-off kickers, balkers and tricksters for a song, handling them a few days and selling at top-notch prices.

Coupon Brings Prof. Beery's Great "Horse-Trainers' Prospectus" FREE

If you want to get into a big money-making profession—if you own unruly horses with bad habits—if you enjoy travel—if you are a natural-born trader and can buy cast-off horses cheap to sell at big profit when trained, send now, today, for this grand Free Horse-Trainers' Prospectus. Tell me all about your horse. (41)

success or not. Mare owners should study this system as well as stallion or jack owners, for it means more and better colts for them. A few statements follow:

I am no reporter for papers, but you know how I stand on the capsule breeding question. I am satisfied that in the last two years I have made $500 per year more by the capsule system than I could possibly have made in the old way of breeding. I will tell you what I think of most importance, is for the stallioner to run his own business. If we go to a merchant and he says his goods are worth so much, we can take it or let it alone and it should be the same with us. I have a good trade and don't keep track of the capsule colts. If I have, say six or eight mares to breed, I make my own choice as to which I breed natural and use capsules on the rest, the best I have ever been able to do was thirteen in thirty minutes and caught nine that paid me all right and then we generally breed all the old non-breeders with this method and of course that is bad.—F. C. Goodrich, Scottsville, Kas.

I am a new beginner in the capsule breeding system. I only bred a very few mares that way and had fairly good luck. I am going to try the three services a week plan this year. I have fully 85 per cent of mares in foal from last year's service and I lay my good luck to the Graham Scientific Breeding School, as I have attended two terms.—E. A. Wallace, Dallas City, Ill.

I have used the capsule system and would not stand my horse the old way. In fact, I think it the only proper way to breed. I have sold my horse and if I have to labor under the present stallion law, will remain out of the business. Am waiting to see what our law makers will do this winter.—H. L. Van Ornum, Forman, N. D.

In regard to capsule breeding, I used that method this season with a Carlson Extractor on several mares that had missed for from three to five years, and had good success with it. There is no doubt with me but it is the surest way to get a mare in foal.—Collings Bros., Bainbridge, Ind.

I know the capsule system is a success if it is handled with care and cleanliness, but don't get it into your heads that you can cause all the old worn-out non-breeding skates to bring colts. In three years using capsules, I have succeeded in foaling 60 per cent of mares and jennets. I wish every mare owner would take the American Breeder.—G. B. Weaver, Harrisonville, Missouri.

The capsule system, as taught by the Graham Scientific School, is of untold value to anyone standing a stallion or jack, as well as to the patrons of such animals, as the stallioner can give his stock more attention and time. The educated stallioner is certainly the safest to patronize, as he is able to insure more safely against disease. — E. O. Lynn, Neosho Falls, Kas.

In regard to the capsule system, will say I have grand success. I have gotten mares in foal the last two seasons that had not got in foal with the natural service. If I had a spayed mare I could use, I would never let my horses cover any mares besides her and I would not run any risk whatever of giving my horse any disease. Also, Mr. Graham, we are in need very much of a good veterinarian, as our veterinary has sold out and moved away; extra good place for a good one. For further particulars, write the undersigned—W. W. Barger, Lacona, Iowa.

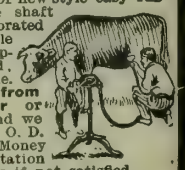
Will say this for the benefit of the readers of the American Breeder in regard to capsule breeding. We have used the capsule system for the last three seasons and have never gotten less than 75 per cent and our natural breeding was about 48 per cent. We had a little trouble in getting the farmers started but now when they come to the barn they ask for the capsule. We have four horses, one standard, two Percherons and one Belgian. We bred 491 mares the season of 1912 and 80 per cent were bred with the capsule. We would not do without the capsule for any price. Would recommend it to all horse owners.—Ditgen & Schmitz, Andale, Kas.

I have used the capsule system of breeding for three years as per instructions of the American Breeder and have had splendid success. I do artificial breeding three times a week. I have never had a single complaint.—S. R. Schmitz, Mayview, Mo.

I have four head, two stallions and two jacks; have been here for six years. I have a large business worked up; breed some five hundred mares each season. At first I tried to breed all mares that came in, by natural cover, but this I soon found I could not

IMPROVE YOUR STOCK

It Pays to Clip



Horses, Mules and Cows. They are healthier and render better service. When the heavy coat that holds the wet sweat and dirt is removed, they are more easily kept clean, look better, get more good from their feed and are better in every way. The best and most generally used clipper is

The Stewart Ball Bearing Clipping Machine

It turns easier, clips faster and closer and stays sharp longer than any other. Gears are all file hard and cut from solid steel bar. They are enclosed, protected and run in oil; little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head, highest grade.

French Coach stallion; 12 years old, and a 4 year old black jack. **E. Joy, Golden City, Barton County, Mo.**

BREEDING STOCK

for sale or trade for farm land. Registered German Coach stallion, two good jacks and two mares. Address **Dr. Philip J. Schoene, Corner Main and Cusad St., Summerfield, St. Clair County, Ill.**

SADDLERS.

40 saddle stallions, mares, colts and fillies of the best Denmark and Chief breeding. Special prices on stallions for the next 30 days. **J. F. Cook, Lexington, Ky.**

WANTED.

Man to stand jack during breeding season. Must be familiar with using capsule system; know how to keep breeding records; must be sober; industrious; not over forty-five years old and single. Correspondence solicited. **Bert H. Whiteley, Muncie, Indiana.**

Lake View Stock Farm

For sale, 15 jacks as good as any one has, from six months to five years old and from 14 to 16 hands high. I can sell them for less than any one. Write for particulars or come and see them. **T. H. Early, Centralia, Boone County, Mo.**

OAKWOOD FARM.

The home of imported Taxpayer (for which I paid $3,250 at auction).

20 Jacks, Imported and Native.

Two to six years old; 14½ to 16 hands with lots of bone, substance and quality. Have some attractive offerings in young jacks, and jennets with foal; descendants of imported Taxpayer. All stock registered and warranted. **Allen B. Harlan, Columbia, Tenn.**

For Sale or Trade

Nine jacks from six months to 10 years old and six jennets. The reason for selling all of this stock is trouble in my family. These jacks are heavy boned and short legged. **W. C. Fithen, Richville, Ottertail County, Minn.**

Two Good Jacks

For sale. One 16 hands high. 7 years old. The other jack is 5 years old and 14 hands high. Price reasonable. Colts in the country to show their breeding. Address **Wm. H. Knox, Bowling Green, Clay County, Ind.**

10 MISSOURI BRED JACKS

Sucklings to five years old; black with white points. The good kind. Nine jennets of the right type; two years old and up. All jennets of breeding age with foal. Correspondence solicited. Visitors welcome. **Guy W. Fisher, Frankford, Pike County, Mo.**

Page Avenue Jack and Jennet Farm.

Three good herd jacks for sale; weight about 1,000; plenty of bone and frame; first class breeders and good ages. Also young ones for sale from colts to two year olds. Two of these jacks are half brothers to Missouri Wonder, sired by Silver Dick Bland. **J. R. Reynolds & Son, Guthrie, Callaway County, Mo.**

GRANDVIEW JACK FARM.

50 head of black Mammoth jacks and jennets for sale, from 1 to 7 years old. In the offering will be my herd jack, Monster, 16½ hands; very heavy bone and body. This jack is good enough to head anybody's herd of jennets. Would not offer him but his colts are old enough to breed. Would exchange for one as good.

Also one imported Belgian stallion and one registered black Percheron. **C. McNulty, Stockton, Rooks Co., Kas.**

JACK AND JENNETS

For sale. Ten jacks, ages from colts to 8 years old, four of which are 2 years old and one 3 years old; of good size and conformation.

Ten good jennets all in foal to Thompson's Wonder 2154; 16½ hands high. Prices reasonable. **W. L. Graham, Mackville, Washington Co., Ky.**

Three Black Jacks

With mealy noses, big ones—jacks with plenty of height, lots of bone, good ears and feet, good performers and good breeders; 3 to 7 years old. I will sell either one of the three. For further particulars address **A. T. Steelman, Roodhouse, Ill.**

Two Registered Jacks

Coming 3 and 4 years old; 15 and 15½ hands standard. Good workers and guaranteed breeders. Priced cheaper than you can buy elsewhere. My own raising. I need the money. Don't need the jacks. No trades. **J. A. Stormont, Dighton, Lane County, Kas.**

do, so I resorted to the capsule system of breeding mares and had great success.

In one colt show this year I showed two horse colts and two mule colts, all capsule colts, and each of these took first in its class. The capsule system is here to stay; it makes prize winners.—C. F. Johnson, LeLoup, Kas.

In regard to scientific breeding, will say I get from three to five colts at a service with my jack. It is a benefit to myself and also to my customers, as they are not waiting for turns, and you are always up with your work.—A. S. Snyder, Elkville, Ill.

The capsule system has proved to be a great saver of time, both to the mare owner and myself. We can get a good half day's work with our stallion without having to be trying mares all through the day, and there is no need of mare owners making any extra trips. Most of the mares I bred with capsules were not in very good condition, or were mares that had failed to get with foal by natural service. So considering the class of mares, I got a good percentage with foal. I bred a 20-year-old mare last spring with a capsule. She has not got with foal for five years, but she is now showing with foal.—F. H. Taylor, Sedgwick, Kas.

QUESTIONS AND ANSWERS.

(Continued from page 15.)

pay. There is some always breeding old mares in order to trade them off, and as my horse is very sure with my help, I get my share of these kind of mares, and when I breed a mare and get her in foal, I want my money. When mares change hands for trade, usually they do not treat a mare well enough for her to carry a colt until time to foal, and if I fail to collect it at the proper time the claim is lost and I am getting tired of that way.—Ohio Subscriber.

REPLY—If the owner of the mare agrees to pay you when the mare changes ownership or leaves the county, you can sue and collect if the owner of the mare is worth it, or you may advertise these conditions by posters and in the county papers sufficiently to make your point by advertising; unless your state law requires a certain method of publication notice to make that part of your contract binding. It is better to have an understanding with the owner of the mare beforehand so that he absolutely knows the conditions of this contract, then you will be perfectly safe to bring suit on these terms.

STOVE FOR ARTIFICIAL BREEDING—I would like to know what kind of a stove is the best to use to keep the water hot for artificial breeding. This is a great problem, as most stoves get too hot.—Oklahoma Subscriber.

REPLY—An oil stove is usually the best and cheapest for heating water. Gasoline and other fuel may not be very safe about the barn. We would like to have a discussion as to the best method of heating water for breeding purposes. This is an important subject. The time has come when breeders must have sterilized water to use in their breeding operations, whether they use capsules or the natural service, every breeder should study this subject.

REGISTERING A JACK—In the enclosed pedigree I cannot find where his sire or dam have any pedigree or register record. Will you look over the record and see if you can find any of his ancestors recorded, and if not can I have my register certificate changed, as I don't want to misrepresent this animal? Will return certificate if need be.—Kansas Subscriber.

REPLY—Jacks are registered on specifications. Your jack has met these requirements and is registered in the Standard Jack and Jennet Registry of America. Blood lines are not necessary in the foundation stock of this association. This is the only live stock record in the world that is founded on principles requiring a well proportioned conformation, and if the breeders will patronize this record association, and have the jacks and jennets registered according to the requirements, it will only be a question of time until the progeny will breed true to well formed type. We are glad to receive a frank statement, as the above indicates this man is honest; he does not wish to deceive any one, and the world would be better and less critical if we had more such individuals.

ARABIAN HORSE COLOR—What is the color of a full blooded Arabian horse?—Kansas Subscriber.

LaFAYETTE STOCK FARM

HIGGINSVILLE, MO.

Mammoth Jacks & Percheron Stallions

20 JACKS—3 to 6 years old; 14.2 to 16 hands high. All black; all broke and guaranteed.

55 Miles East of Kansas City on C. & A. R. R.

My Fourth Annual Jack and Jennet Sale of the

CLOVER LEAF VALLEY JACK FARM

WILL be held in my new pavilion at **La Plata,** Macon County, **Mo.,** on **March 10, 1913,** when I absolutely guarantee to sell the bets bunch of jacks and jennets that I ever offered for sale and one that will equal or surpass any offering of this stock made during the year 1913. Every jack and jennet registered and black with white points. I want you to write now for my catalog illustrated with the photographs of every animal taken from life January 2, 1913, and telling you more truths about this stock than I could possibly put in a great big five-page advertisement costing thousands of dollars. I sell more jacks that pay for themselves in one and two years than any man in the world.

Write for the catalog now and be sure to mention the American Breeder

G. C. ROAN, PROP., LA PLATA, MACON CO., MO.

MAMMOTH JACKS, PERCHERON STALLIONS

33 Head of Jacks and Percherons.

The jacks are three to six years old and from 15 to 16 hands high.

Percherons are from two to six years old and weigh from 1800 to 2000 pounds.

We Have the Kind That Will Please You.

Write for prices before you buy. Farm and sale barn on 21st street one miles east of Wichita Union Stock Yards. Write today.

J. C. KERR, WICHITA, KAS.

"Oakland Stock Farm"

The most extensive breeders of jacks in Missouri. We raise them, and raise them so we can sell them cheap. We are not in the brokerage business—sell no jack to the farmer that we don't raise ourselves. We guarantee all of them; have them in value and can sell them from $250 up. Come and see them; come and stay all day and night, if you want the jack for yourself.

OAKLAND STOCK FARM, CHILLICOTHE, MO.

IMPORTED PERCHERON STALLIONS, JACKS AND JENNETS

For SALE—5 imported black Percheron stallions, 4 to 6 years old; all tried and regular breeders; can show colts; weigh 1,800 to 2,200 pounds. One Morgan stallion, 7 years old. **10** large black jacks, 2 to 7 years old, all broke; good performers; can show colts and mares in foal. **10** head big black jennets, all bred to our imported jack. Prices reasonable. Write or come to farm 4 miles from Raymond or Chase. Our horses and jacks were shown at the Kansas State Fair at Hutchinson. erent classes, and won in every class. September, 1912, in six diff Come and see us. **J. P. and M. H. MALONE, CHASE, KANSAS.**

JACKS FOR SALE

Ranging in age from one to eight years. These jacks are good size and heavy bone, and prices reasonable. Also an imported Percheron and a German Coach stallion cheap. Write, or better, come and see this stock before buying.

Address C. F. Rice, Indianola, Vermilion County, Ill.

WANTED.

Two or three good jacks; must be at least 15 hands standard measure and weigh 1,000 pounds or more. Must have good foot, bone and body; quick to serve mares and sure foal getters. I have no choice of color if they have lots of quality. I also want a good stallion.

I want this stock to stand on shares with the privilege of buying jacks at an established price to sell. I know how to care for and sell jacks. Have handled jacks and stallions for twenty-five years. Can give best of references.

Don't answer this ad unless you have good stock and mean business, as I have no time for worthless correspondence.

ADAM MATZ, Carmi, White County, Ill.

MISSOURI REGISTERED.

Spanish jacks and jennets. Seven jacks and six jennets; mostly black with white points; ages from 6 months to 3 years; including my 10 year old herd jack; weight 1200 pounds. Would not offer him only I must change—some of his colts are old enough to breed. Price $1,500 for all. Will sell one or all. **Frank Busch, Villa Ridge, Franklin County, Mo., R.F.D. No. 1.**

NOTICE.

Eight head of large Mammoth jacks and eight head of large Mammoth jennets. All young and right in every respect. Jennets in foal to 1200 pound jack. Will sell at a bargain or exchange for land within 100 miles of Kansas City. **W. W. Shott, Lathrop, Mo., 39 miles north of Kansas City.**

JACKS FOR SALE.

If in the market, write me. Have two good jacks for sale. Their mules here to show. Will trade one for good driving team. **Thos. D. Marshall, Sylvia, Reno County, Kas.**

JACKS FOR SALE.

Sired by the great jack, Dr. McCord 1776, supposed to be sire of more high priced jacks than any jack living or dead. Also some jacks sired by Dr. Long 1767. If you are in the market for a jennet jack of the right kind, see **Dillingham & Dewitt, Blue Springs, Jackson County, Mo.**

SOME GOOD GRAY JACKS

For sale; my own raising; sure breeders; the kind that sire good size and good style mules. Priced right. Address **A. C. Briggs, Missouri Valley, Harrison County, Ia.**

Ten Jacks

one to six years old for sale. Must be seen to be appreciated.

HAMPTON BROS., WINCHESTER, CLARK CO., KY.

Two Jack Bargains

One black Spanish jack, 4 years old, price $300.

One black Spanish jack, 5 years old, price $450.

Both sure and quick; mules to show.

Julius Lebantschnig, R. 1, New Douglas, Madison County, Ill.

PREMIUM JACK.

KENTUCKY JUMBO; black jack, white points; six years old in September; 15¾ hands. Won second premium at one and two years old against all jacks; won first premium at three, four and five years old against all jacks. Big head, big ears, big body, big bone and a big jack; good performer; sure breeder; gets big mules. Plenty of colts to show. If you are not looking for a No. 1 jack, this is not the jack you want. Price $1,500. No trades.

Have a nice jack two years old in July; black, white points. Would trade for registered Percheron stallion or registered mare in foal. **P. H. Vories, Sparta, Gallatin Co., Ky.**

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. **Scott, Abney & Jenkins, Virden, Macoupin County, Ill.**

THREE SHOW JACKS

for sale. Three registered black jacks; three years old; 15½ and 16 hands high. Good enough to win at any state fair.

YEAGER & BROSHEARS,
Oakland City, Gibson County, Ind.

2 Black Jacks

AND ONE SADDLE STALLION

extra good, for sale; priced right.

Would trade for registered Percheron stallion. **Louis Schneider, Horton, Vernon County, Mo.**

REPLY—There is no particular color for Arabian horses; nearly all colors may be found in this breed. The idea generally prevails that Arabian horses are white. But this is a mistake. Collections of white and spotted horses have been exhibited at different times and represented as pure bred Arabians which has caused a considerable comment concerning the color of these horses. There is a recognized registry association in this country for pure bred Arabian horses. While there are quite a few greys among them, the white or spotted horses are very scarce.

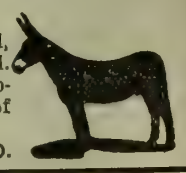
REGISTERING SADDLE HORSES—I am seeking information how to register two colts sired by Rex Squirrel No. 5053; dam Lettie, sired by Westward No. 2363. Any information you can give me as to cost for registering, where to register and what will be necessary to register, will be highly appreciated. The dam of the colts is pedigreed, but not registered, but is eligible to registration.—Missouri Subscriber.

REPLY—Rex Squirrel 2053 is registered in Volume 2 of the American Saddle Horse Breeders' Register. You will write to the secretary of the American Saddle Horse Breeders' Association, Louisville, Ky., for application blanks and full particulars.

DISTEMPER IN BREEDING STOCK—In the spring of 1911 I stood a three year old jack and a two year old horse. The jack never did serve more than one mare a day, but scarcely missed one day while season lasted. I could have gotten three times the mares if I could have served them. He turned his mares off good; very few ever taking the second time. He foaled 75 per cent of his mares from the middle of July until the first of February, 1912; then, there were eight mares lost their colts from the jack. The horse served from two to three mares a week, seldom more than two. There were four mares that lost colts from the horse in about the same length of time as from the jack. They both started in the season in fine shape; were fed the very best feed; had a pasture with lots of good grass to run in. About the middle of April they both took the distemper; the jack was off his feed for three or four days and hardly ate anything; the horse never misses a feed. I kept them in good flesh. They had a very light cough that lasted until fall. Last spring the horse served twice the mares he did the spring before. The jack served from eight to nine mares a week. They both had the same care in 1911. There hasn't been but one mare that lost a colt so far and this one got kicked, which was the cause of this. Do you think this was the fault of my stock, or was it a disease among the mares?—Texas Subscriber.

REPLY—The year 1911 will long be remembered by the breeders of live stock as a serious year; the conditions were not favorable to mares carrying their colts a full period. The year 1912 has been much better. The point we wish to emphasize in this case is that you may not have as many mares in foal as you are looking for owing to the distemper in your breeding stock—the per cent of foals may be very light. Next spring you will remember that we made mention of this fact. There is perhaps no other one thing as dangerous to breeding stock as the so-called distemper. Stallions or jacks should not be used while in the condition you describe. We have known quite a few good sires to be nearly ruined by being used while they had this sickness. They should be retired from service until they entirely recover.

Missouri Registered Mammoth Jacks AND JENNETS



FOR SALE AT ALL TIMES.

As fine a bunch as can be found on one farm. Guaranteed as represented. Prices that are bargains. Come and see them.

J. T. Watson, New London, Ralls County, Mo.

HOME OF THE GIANTS.

75 Jacks and Jennets 75

All black; all registered. The big boned, big footed, heavy weighing kind. All from 15 to 15 1-3 standard. All ages up to six years. Every one guaranteed as represented. Main line Missouri Pacific; 65 miles east of Kansas City. Offices in town.

BRADLEY BROS., WARRENSBURG, MO.

BREAKING A SLOW JACK—What is the best and surest method of breaking a slow "jenny jack?"—Kansas Subscriber.

REPLY—We would be glad to have our readers give their experience with slow jacks. A discussion of this subject is invited.

SURENESS OF AGED STALLION—Will a horse that has once been noted as a sure foal getter, but has been "overbred" ever "come back," with proper care? If so, what is the best method of caring for him? My horse is nine years old, strong, healthy, active and keen. One party who stood him three seasons writes me he made as good as eighty-five per cent the three years he stood him and he has always been recognized as a very sure foal getter, but I think he must have been bred to excess at some time prior to the time I bought him, a little more than a year ago. The past season I bred forty mares and will get forty or fifty per cent of colts from all mares bred. Will a lot forty-five by forty-five feet, to which he has access at will, be sufficiently large for him to take exercise during the winter months, or would I get better results during the breeding season to work him on the farm this winter? What is best feed for a stallion or jack during breeding season?—Texas Subscriber.

REPLY—I think your stallion will give you an average per cent of foals. He may not be as good as he once was but nature very often does wonderful things for animals. I would limit this stallion to about one service a day and use the capsule system as much as possible. I am of the opinion that this stallion is a rank server and the semen is perhaps not ejaculating into the uterus as it should. If you will use capsules properly every service will be a complete service. If you are seriously doubtful about this horse I should advise using the microscope at every service. Oats and bran, equal parts by measurement, should be good feed for your stallion when fed with prairie or Johnson hay. We would not advise any serious change in the method of handling or feeding this horse; do not feed too extensively, but just keep him in a good physical condition so that he will gain gradually during the breeding season.

EXERCISING A STUD COLT—Will a yearling (past) saddle stud get exercise enough in a box stall 12x19?—West Virginia Subscriber.

REPLY—This colt cannot take sufficient exercise in a box stall of this size. One of the greatest requirements for all good live stock is to have ample room for exercise. The digestive organs must work just as well, or a little better, in developing an animal than in mature stock. More especially do these active horses need more room because these colts will be expected to be actors at maturity. If he has never had an opportunity to expand his muscles, the owner will be to blame.

BREEDING HINNIES—I have five jennets that I am going to breed on the share; the party owning them wants them bred to my registered Percheron horse which weighs 2,000 pounds in good flesh. Two of these jennets had jennet colts last spring; three of them have been rebred and but one of them shows in foal; the other two are coming three and never have been bred. Now, what I want to know is: Will these jennets breed to a horse as well as to a jack, or is there much difficulty in foaling them to a horse? Three of these jennets are about 14½ hands high and have pretty good bone and pretty well made; the other two are small and not more

Stallions and Jacks

for sale. Two extra good jacks and two fine stallions. Jacks both black with white points; 15½ and 16 hands; big bone and large head and ears; good breeders and sure foal getters.

One imported Percheron draft stallion; 8 years old; weighs 1800 pounds; extra good breeder; good disposition.

One saddle stallion; 3 years old; 16 hands; will weigh about 1100; dark bay; goes all the gaits; a good breeder; will make a show horse. Colts and books to show. Reasons for selling: I am in poor health and not able to take care of them. Priced to sell quick. Reasonable terms.

F. C. Kroll, Lexington, Lafayette Co., Mo. R. F. D. 2.

45 miles east of Kansas City on Lexington branch of Mo. Pac. R. R.

JACKS AND JENNETS.

One of the largest collections of large boned black mammoth jacks owned by any one man; 15 to 16 hands standard measure; the kind that will breed the high class mules; the kind all are looking for. Priced to sell. Guaranteed. References the five banks of Lawrence. Address **Al. E. Smith, Lawrence, Kas.** Both phones.

Forty miles west of Kansas City on Santa Fe and U. P. R. R.

"THE BIG FOUR."

Black jack with white points; two years old the first of last November; 15 hands standard measure. He has as much length and bone as anybody's jack; fine head and ear; big fine foot and bone. He is by Tax Payer, Jr., and out of a 15-hand jennet. He is big enough and bred good enough to head a herd of anybody's jennets; weigh 900 pounds; will make a 1200 pound jack. For photo and price, address, **W. H. Alexander, Lynnville, Giles County, Tenn. R. F. D. No. 2.**

SIX JACK COLTS

For sale. Also two Percheron stallions and five Standard bred stallions. 640 acres devoted to live stock. 22 miles from Kansas City and 28 steam and electric cars each way daily. Make appointment with me by phone or mail.

F. M. Lorimer, Olathe, Kas.

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. HUCKSTEP,
Eolia, Pike County, Mo.

TWO YOUNG JACKS

For sale—my own breeding; 5 and 3 years old; black, with light points. The older one has proven to be an extra good breeder; the younger is not broken; they are 14¾ and 14½ hands high; I have their half brother, older, but no better bred, that is 16½ hands, with 10-inch bone. I guarantee every statement I make.

R.J. Dillon, Spring Hill, Johnson Co. Ks.

than 13 hands high. I am figuring on breeding them by capsule. Will a jennet raise as good a mule bred to a horse as a mare will breed to a jack? —Oklahoma Subscriber.

REPLY—You can breed these jennets to your Percheron stallion with the Capsule System if you will be careful with your work. After they have been bred take them away from the sound of the jacks so that they will go out of season. Arrange to breed those that have colts on the ninth day with a capsule, whether they are in heat or not. A jennet is not quite as sure to a stallion as she would be to a jack. These three jennets should not be bred to a stallion unless you have other reasons than those you have given. These jennets are too good to raise mules; they should be bred to the largest and best jack in the country. Good jacks are going to be very scarce in the near future and it is not advisable to take good females from the ranks of this class of stock. A jennet will not raise as good a mule as will a mare because she does not have the capacity to digest enough food to give a sufficient flow of milk. They would do much better if the progeny could have plenty of feed. This is a point well to remember, that all animals that are expected to develop rapidly and make a good growth, must be fed liberally from the start.

TWO YEAR OLD SERVICES—How many mares should a two year old saddle stud serve and how often should he make service?—West Virginia Subscriber.

REPLY—About ten services should be the limit for this colt, with no two services closer than one week. Do not permit this colt to do any teasing or allow him to run in a paddock where mares have been bred or teased unless you wish to encourage him to masturbate.

REGISTERING STANDARD BRED HORSES—I have a trotting mare, 20 years old that was sold when she was a two year old with papers in writing as follows: "One brown filly sired by Moonlight; dam Mattie Cook by Geo. Cook by Don Pedro, by Mambrino Chief. (Signed) Jerry Johnson. (Witness) E. H. Hutchins." Do you think these papers are enough to get this mare registered? If so, where will I write?—Colorado Subscriber.

REPLY—We would advise you to correspond with Frank E. Best, secretary of the American Trotting Association, at Chicago, Ill. We doubt very much if this mare can be registered and if there is any possible show of having it done, it should be sent in immediately as there is considerable talk of closing the records and permitting only the progeny from registered ancestors.

OLD MARES AS BREEDERS—Is a mare 20 years old, that failed to get in foal this year, likely to get in foal another year?—West Virginia Subscriber.

REPLY—The fact that your mare has failed to produce at this age will make her more difficult to fertilize, as a rule. There always comes a time in the life of every female when she will cease producing. This sometimes happens in mares in otherwise prime of life. Some are really short lived in this respect. A mare of this age, or any other mare for that matter if not diseased or has some abnormal condition can frequently be benefited by using the saline solution. This increases the blood supply and assists nature to perform its natural functions. We have been trying for several years to get our readers to understand more about assisting nature in the production of offspring.

A FOUNDERED JACK—Will a jack that has been foundered breed any of the effects in the mules he sires? The jack's feet is about all the way he is off from being foundered.—Missouri Subscriber.

REPLY—Your jack will not breed any of the effects of being foundered. He might have a bad conformation that would be closely related, or a weakness that would resemble founder to some extent, and these he would breed. The result of accident or sickness is not transmitted.

PERCHERON FRENCH DRAFT—To satisfy myself as well as other readers of the American Breeder who may have been erroneously informed, will you please answer, through the columns of the American Breeder, the following questions: What is the difference between the French Draft Horse Association and the Percheron Association? Can you give me the history of each? I recently bought a stallion that is registered in the National French Draft Horse Association and the parties I bought him of said he was a Percheron horse. Some of my neighbors say he is not and that the French Draft and the Percheron are two separate and distinct breeds of horses. Now which is right? —Kansas Subscriber.

REPLY—In 1876 a record association was formed for registering draft horses from France. A few years later a factional fight was started in this record association. One element contended that horses from the Perche, Boulonnaise, Nivernaise and Ardennaise districts were all the same. The other element contended that horses bred in three departments known as the Percheron districts of France, should be recognized as Percheron horses. Another record was started which is now the Percheron Society of America. Both of these records claimed the date of 1876 as their origination. The French draft have admitted the registered breeds of draft horses from France which are registered at Paris by the Department of Agriculture. The rules of the Percheron Society for a great many years have admitted only animals bred in the Percheron districts of France. These horses, however, can be registered in the French draft book, but those registered at Paris could not be registered in the Percheron Society of America. There is not very much difference between the Percheron characteristics, and some of the other draft breeds registered with the French draft association in Paris.

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. Dispersion Sale

Clydesdale Horses
Angus Cattle

Thursday, February 20th

My entire stud of Clydesdales, headed by Imp. Athlete (10961) 12455, son of the great Baron's Pride (9122), 2 aged stallions, 1 three-year-old, 1 yearling, 3 weanlings, 7 mares, 3 to 6 years old, and one yearling filly.

I have kept Clydesdales for 30 years and reserved the best stock for my own use. The mares are all in foal to Athlete, are fine workers, sound, weighing 1,600 to 1,800, and can show the best colts in Western Iowa.

For full information about both the Angus cattle and these Clydesdales, write me at once, mentioning the American Breeder.

R. M. Pomeroy,

Shelby, Iowa

William T. Trotter's

Second Annual Jack Sale

Will Be Held in

Mt. Ayr, Iowa, February 27th

This offering consists of

15 Big High Class Jacks and 15 Jennets, 3 to 8 years old

These are all blacks, 14 to 16½ hands high, heavy boned and heavy bodied.

The jacks are all broke to serve and include some of the best mule producers in the world and a few right to head good jennet herds.

The jennets are very roomy and deep bodied and are bred to our two stud jacks Keno and Jumbo.

Do not miss this sale if you want a good one.

Write me for catalog and be sure to mention the American Breeder.

CLYDESDALE HORSES.

Feb. 14—W. F. McCoy, Pleasant Plains, Ill.
Feb. 20—R. M. Pomeroy, Shelby, Ia.

An excellent chance to buy a Belgian stallion and a high class jack, as well as a lot of other farm animals, is offered in the advertisement of J. C. Duguid, Olathe, Kas., who holds a public sale February 11. The Belgian is a bay and in addition to being typical of his breed, his colts are unusually desirable in the matter of color. Plenty of colts by both stallion and jack can be seen.

Fence builders, and that means most of us, should refer to the advertisement of the Up-To-Date Manufacturing Co., 990 Tenth street, Terre Haute, Ind., in this issue and get this company's catalogue and prices.

There is a best in everything and the possibilities are that best collection of large type Poland Chinas in the United States is advertising its public sale of bred sows and gilts in this issue of the paper. The herd referred to belongs to W. B. Wallace of Bunceton, Mo., and is known as "Wallace's Mammoth Poland Chinas." Mr. Wallace has put more money in good, practical foundation stock the past half dozen years than probably any other breeder. He apparently has built up one of the biggest and highest class demands for his stock which any breeder has ever built in an equal length of time. In all his selections, whether buying from outside or reserving animals from his own production, he has asked but one question, "Which is the best?" until now, with a herd numbering 500 head he is able to spare and offer to his customers a collection of absolute tops. Mr. Wallace is not expecting extremely high prices in this sale, but one thing is certain, that buyers for the extremely good kind will find in his offering just what they want. Do not fail to send for an illustrated catalogue of these money making hogs, addressing W. B. Wallace, Bunceton, Mo., and mentioning the American Breeder.

Notice the announcement of the Nuckolls County, Neb., Horse Breeders' Association in this issue. The association holds a public sale of Percherons at Lincoln, Neb., February 20. Send for catalogue at once, addressing this association at Ruskin, Neb., and be sure to mention the American Breeder.

Good Jacks

A few very desirable ones for sale; two to seven years old; good height, bone and color.

G. H. MINTON,

Forest City, Holt County, Mo.

STALLIONS AND JACKS.

Imported Percheron stallion; dapple gray; weight 1800 pounds. Will sell or trade for horse that is good enough for full blood mares. Reason for exchanging—his colts are in the way.

Black jack; 2 years old; 14½ hands; extra fine; will make a 1,000 pound jack. Price $450.

Two German Coach stallions. Will sell either one. **Clem Gude, Hamburg, Fremont County, Ia.**

Big Black Jack

15½ standard; 16¼ tape measure; heavy bone; extra worker and breeder. Let us show you. **Garee & Garee, Noble, Cleveland County, Okla.**

REPUBLIC COUNTY JACK FARM

Three good jacks coming 3 years old, for sale, including two that are extra good. Will pay car fare if they are not.

T. E. Collins & Son, Belleville, Republic Co., Kansas.

DEER PARK BREEDING STABLE.

Has for sale stallions, jacks and jennets. Percherons, Shires, Trotters and Saddlers of the best kind. All registered. Jacks of the good kind from six months old to seven years old; all blacks with white points, and some as good as grows. Am going to close out. Sell the good seed at bargain prices. So come if you want good stuff at a bargain. **Sappington & Brockman, Centralia, Boone County, Mo.**

A $1,000 JACK TO TRADE

A big, full made black jack with white points; 15 hands standard; six years old, for two good young draft mares in foal. Clydesdale preferred. Tell it all in first letter. **Enos Hayes, Elizabethtown, Hamilton County, Ohio.**

JACKS AND PERCHERON STALLIONS

Best lot of jacks ever offered at Quiet Glenn; the big kind with herd headers among them a specialty. Buy this fall, get choice and save money. — G. M. SCOTT, Rea, Andrew County, Mo.

THREE JACKS FOR SALE.

One registered jack, 16 hands high; black with white points; extra heavy bone; good feet; good head and ears; foaled June 16, 1908. One brown jack; 15 hands high; heavy bone and body; good head and ear; foaled Sept. 4, 1909. One black jack; 15.3 hands high; extra good breeder—jennet jack—foaled in 1903. Will sell cheap or exchange for draft stallion. **W. W. Downing, Hawk Point, Lincoln County, Mo.**

EXTRA GOOD HERD JACK

for sale; seven years old; weighs 1125 pounds; serves well on mares and jennets. Also two year old jacks and jennets as large as they grow anywhere. I guarantee them to be right. Come and see them. **Henry Obermann, Freistatt, Lawrence County, Mo.**

JACKS FOR SALE.

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention the American Breeder. **S. W. Jetton & Co., Murfreesboro, Tenn.**

RAISED ON MARES

Young jacks for sale, that were raised on brood mares—a great plan for getting mule jacks that are quick workers.

I want a good Percheron brood mare. Will trade jennets or jack stock.

Stanley Turner, Water Valley, Texas.

JACKS AND STALLIONS

I can furnish a few extra good registered jacks and jennets, also a few choice draft stallions, for less money than any one. **L. Donaldson, Olney, Lincoln County, Mo.**

J. C. Greenawalt, Muscotah, Kas., has a new and interesting form of advertisement in this issue. He has three roadster bred stallions and a number of mares which he must sell on account of ill health, and asks prospective buyers to look at these horses and leave sealed bids on any or all of them. Bids will be opened at a certain date and the highest offer will get the animal.

One of the most important jack and horse sales in North Missouri will be held March 12 by J. E. Clary, Sheridan, Mo., and parties interested should write Mr. Clary at once for catalogue and be sure to mention the American Breeder. The jacks and jennets which Mr. Clary sells are of the blocky, heavy boned type—a type which the best mule business of this country especially demands, and of which we have never had enough.

W. T. Trotter of Mount Ayr, Iowa, holds a public sale of jacks and jennets February 27. His advertisement appears in this issue. Here is one of the season's most important offers, there being two features in it which every buyer will appreciate. In the first place the jacks include some of the best mule breeders in Iowa; in the second place the offering of jennets is made up of deep bodied animals and all of them are bred to high class jacks. Buyers of either of this class of stock understand that they get money makers right from the start, and that is the point to be considered in making an investment. Write Mr. Trotter at once for catalogue and mention the American Breeder.

For catalogue of the public sale of registered draft stallions and mares to be held at Beloit, Kas., March 6, address M. A. Smith, Cawker City, Kas.

It is just a few days until Burress Bros. of Carroll, Neb., hold their public sale of registered Percheron horses, the date of the sale being February 11.

Notice the bargain offer which G. B. Weaver of Harrisonville, Mo., is making to close out his breeding establishment. He is going out of the business on account of his age.

The advertisement of the Chicago Flexible Shaft Company, Chicago, Ill., in this issue reminds owners who clip their animals that the season is here in the southern part of the United States, and it will not be long until they will be clipping them everywhere.

A tool, or rather a combination of twelve tools in one, which is needed in every barn, livery stable, factory, garage, etc., is manufactured by the Automatic Jack Company, Box O, Bloomfield, Ind. This company wants agents.

D. J. HUTCHINS OF STERLING, KAS., the first subscriber to the Stallion and Jack News, now the American Breeder. Mr. Hutchins paid his subscription at the Monsees sale five years ago, where he bought the highest priced jack ever sold at auction up to that time.

The big practice term of the Missouri Auction School is now on, this term having opened February 3. The announcement of the next term appears in the school's advertisement in this issue. For particulars address W. B. Carpenter, president, 1405 Grand avenue, Kansas City, Mo.

Look up the advertisement in this issue of Wm. H. Knox, Bowling Green, Ind., and write him for further particulars about the two jacks he is offering.

Any one in the market for good work horses should look up the advertisement in this issue of J. A. Prather, Alamogordo, N. M. Mr. Prather has two carloads for sale.

Alex Galbraith & Son of De Kalb, Ill., one of the oldest and best known importers of Clydesdales in this country, start their ad in this issue. If you are in the market for Clydesdale stallion or mare, don't fail to investigate what they have for sale.

Don't fail to read the ad in this issue of the Kingery Realty Co., Kingery, Kas. It may interest you.

J. F. Cook, Lexington, Ky., is offering 40 saddle stallions, mares, colts and fillies for sale in this issue at special bargain prices for 30 days.

Read the advertisement in this issue of Guy W. Fisher, Frankford, Mo. He is advertising ten Missouri bred jacks and nine jennets for sale and would like to hear from anyone wanting stock of this kind.

Geo. Worley of Dongola, Ill., is offering for sale in this issue two high grade Percheron stallions; also a 16-hand jack. Write him for full information.

J. R. Reynolds & Son of Guthrie, Mo., are advertising three good jacks for sale in this issue. Don't fail to look up their ad if you are interested.

Fifty head of jacks and jennets are advertised for sale in this issue by C. McNulty of Stockton, Kas. He is also offering his herd jack, Monster. Look up the ad and then write for further information.

If you are in the market for a jack or jennet, don't fail to look up the advertisement in this issue of W. L. Graham, Mackville, Ky. He may have just what you want.

Look for the advertisement in this issue of John Scherer, Olney, Ill. He is advertising a standard bred stallion for sale.

For further information about the three jacks which A. T. Steelman, Roodhouse, Ill., is advertising in this issue, write him and he will be glad to tell you all about them.

If you are in the market for a jack it would undoubtedly pay you to write to J. A. Stormont, Dighton, Kas. His ad appears in this issue.

Woodlawn Farm, Sterling, Ill, have some Percheron stallions advertised for sale in this issue. They will sell these stallions worth the money and would like to hear from anyone in the market for stock of this kind.

"Can't Sag" gates are advertised in this issue by the Rowe Mfg. Co., 615 Adams street, Galesburg, Ill. You will get the idea at a glance when you see the advertisement, and it is certainly worth investigating by everyone. Mention the American Breeder when writing the Rowe Mfg. Co., as per address above.

One of the very few opportunities this year for buying high class Clydesdale horses at auction will be found in the dispersion sale of R. M. Pomeroy, Shelby, Iowa. Mr. Pomeroy has been breeding Clydesdales for thirty years and using them exclusively in his farm work. During all that time he has held out the best stock for his own use and the fifteen head he is selling in this dispersion sale are high class workers, as well as high class producers. At the head of his stud, and included in the sale, is the imported stallion, Athlete, son of the world famous Baron's Pride. See the ad in this issue and be sure to write Mr. Pomeroy for catalog and kindly mention the American Breeder.

An entire herd of Aberdeen Angus cattle will be sold at auction in the dispersion sale of R. M. Pomeroy of Shelby, Iowa. The sale is to be held February 20, so write Mr. Pomeroy at once for catalogue.

Nobody could ask a better assurance of the best values in public sales than is given by G. C. Roan of La Plata, Mo., in his advertisement in this issue. Mr. Roan makes his fourth annual public sale of jacks and jennets at La Plata, Mo., on March 10, and every man in the market for this class of stock will be interested in his catalogue. Mention the American Breeder when writing.

A special and deserved recognition is to be shown to one of America's most important agricultural industries by the new National Fair and Exposition Association, with headquarters in New York. This association plans on being to the East what the International Live Stock Show is to the West, with the addition that it will provide classes for a big showing of jacks, jennets and mules.

Road work is a good thing only when rightly done. D. B. Gunn, Red Oak, Ia., sells a machine (at a low price, too) with which you can do it right. See ad, and do business with him.

One of the vital points in a public sale is the auctioneer. In many sales the right kind of an auctioneer is the whole thing. There is one who is always "right" and that is R. L. Harriman, Bunceton, Mo.

A recent letter to this office from H. L. Goodwin, manager of the American Farm Gate Company, 1457 Elmwood avenue, Kansas City, Mo., states that since March 1, 1912, they have sold 5,000 gates and as yet have not had a gate returned or a complaint because of broken gate. We know for a fact that there is not a stronger farm gate made in America, and probably none as strong, and for convenience and ease of operation the American Farm Gate ranks first. We hope every one of our readers will write the American Farm Gate Company and get full information on this point.

Don't put it off. The oil advertisement of C. A. Stannard, Box A, Emporia, Kas., in this paper, offers several articles which nearly every stockman and farmer needs. Particularly, at this time, is it a good thing to use some "processed oil." It gets 'em—lice and nits both. Tell Mr. Stannard you

ON FEBRUARY 25

for sale, or will trade for pair of mares. A sure foal getter, guaranteed. Reason for selling; am going out of business. **H. V. Somerville, Route 5, Oxford, Miss.**

ONE MAMMOTH JACK

for sale; 16 hands high; 5 years old. **Also One Registered Belgian Mare,** 7 years old; imported; weight, 1700 pounds. **M. J. Ragan, Stockton, Kas.**

EIGHT GOOD YOUNG JACKS

For sale, from 1 to 4 years old. Could use a good young stallion in exchange. **R. B. Miller, St. Michael, Buffalo County, Neb.**

saw his ad in the American Breeder when you write. He owns his own oil wells, and sells his stuff worth the money.

George W. Souers & Sons, importers and breeders of Percheron, Belgian and Coach horses at Huntington, Ind., write as follows: "Business is moving nicely and the prospects are that we will make this a record year. We sold during the last week ten imported draft stallions to customers from the states of Indiana, Ohio and Michigan. We still have a very fine lot of good ones on hand and will make the lowest prices possible, when the quality of the horses are considered. Our business since January 1 is far in excess of any year in the history of the firm."

Thos. D. Marshall, Sylvia, Kas., is advertising two good jacks for sale or trade for a good driving team. See the ad in this issue.

Anyone in the market for good breeding stock should look up the advertisement in this issue of Clem. Gude, Hamburg, Ia., and then write him for full particulars.

Sam Avard of Hawthorn, La., is advertising a 162½ acre farm for sale in this issue. Look up the ad.

If you are in the market for a jack don't fail to read the ad in this issue of Dillingham & Dewitt of Blue Springs, Mo. They have them sired by Dr. McCord 1776.

A registered stallion is offered for sale in this issue by H. A. Dean of Camden, Ark. Read what the ad says.

Oakland Stock Farm, Chillicothe, Mo., start their advertising in this issue. They raise their own jacks and offer them for sale worth the money. Look up the ad.

Rufus Beck of Brownsville, Ind., is offering his imported Percheron stallion for sale at a bargain, as he is going out of the business. His ad appears in this issue.

If you are in the market for a jack don't fail to read the advertisement in this issue of A. C. Briggs of Missouri Valley, Ia. He may have just what you want.

Anyone in the market for Percheron or French draft horses should look up the ad in this issue of G. B. Loper & Sons, Chesterfield, Ill.

W. R. Davis of Sterling City, Tex., is advertising 70 bred mares and a Tennessee jack for sale in this issue at a bargain. Don't miss reading the ad.

E. Joy of Golden City, Mo., is advertising a French Coach stallion and a jack for sale or trade. Write him for particulars.

Look up the ad in this issue of Adam Matz of Carmi, Ill. He is in the market for stock to stand on shares.

A 3-year-old Percheron and a weanling Percheron are advertised for sale in this issue by John A. Spohr, Wellington, Kas. Look up the ad.

H. Knoche & Son of Onarga, Ill., start their advertisement in this issue. They extend an invitation to any of our readers who are in the market for a good Percheron to inspect their stock.

Anyone in the market for jacks or jennets should not fail to read the advertisement in this issue of W. W. Shott, Lathrop, Mo. He has them priced at a bargain, or will exchange for land.

Read what Frank Busch of Villa Ridge, Mo., is advertising for sale in this issue. You may be interested.

Yeager & Broshears of Oakland City, Ind., are advertising three show jacks for sale in this issue. Don't fail to look up the ad.

Anyone wanting a position on a stock farm should look up the advertisement in this issue of Bert H. Whiteley, Muncie, Ind., and if you can fill the requirements, correspond with him.

Louis Schneider of Horton, Mo., is advertising two jacks and a saddle stallion for sale or trade. See what the ad says.

W. J. Finley, the well known breeder of jacks and Percherons at Higginsville, Mo., starts his ad in this issue. Mr. Finley will sell his stock privately as he is not expecting to have his usual big public sale this spring. If you are in the market don't fail to read the advertisement.

Wm. D. Whisler of Garner, Ia., is closing out his stock of eighteen Percherons three stallions and fifteen mares. No doubt there are many bargains to be had here and anyone in the market for stock of this kind should not fail to write Mr. Whisler for description and prices. His ad appears in this issue.

Stallions in service. Why do they often become weak, exhausted and "slow?" Because their systems become impoverished from the drain on their vital forces and their bodies infected with poisonous germs absorbed from direct contact in the act of service. Spohn's Cure, given a dose every two or three days, will act directly on the blood, expelling the poisonous germs, and keep the whole system toned up and vigorous in service.

A match team of Clydesdale mares are offered for sale in this issue by Frank M. Pollard, Dexter, Minn. He also has two Clydesdale stallions for sale. See the ad.

Absorbine reduces swellings and fatty bunches, strengthens strained ligaments, muscles, heals cuts, bruises, allays pain and inflammation. Does not blister or remove the hair and horse can be used. $2 a bottle at druggists or delivered. W. F. Young, P. D. F., 388 Temple St., Springfield, Mass.

Taylor & Jones of Williamsville, Ill., write as follows: "Old customers continue to come and we are doing a nice, quiet business and still have some extra good bargains in Percherons, Belgians and Shires. We also have a nice lot of draft mares, so can fit you out nicely, if you are in the market for both. We can show a line of imported and American bred stallions and mares with quality, draftiness and weight at prices that will appeal to any one who really wants to buy. Our two guarantees afford you absolute provection and we will be glad to explain these to any one contemplating buying stallions of any of the draft breeds. Come and let us explain our manner of selling stallions so you take no risk whatever."

A. Latimer Wilson of Creston, Iowa, writes that he will have an importation of Percheron and Belgian stallions and Percheron and Belgian mares to land at Creston the 15th of February.

"Business is good," is the report we always get from Henry Lefebure, importer and breeder of Belgian draft horses at Fairfax, Iowa; he reports his horses all in the pink of condition, and the sort the American people are looking for. His sales since the International are as follows: A roan Belgian to J. J. Scott of Shipley, Ia.; sorrel Belgian to Simon O. Donnell, Seneca, Ill.; bay Belgian to J. H. Rahilly, Dexter, Minn.; black Percheron to Herman Milke, of Daraboo, Wis.; bay Belgian to Wm. Felton, Maquoketa, Ia.; sorrel Belgian to J. Serbosek, Fairfax, Ia.; grey Percheron to W. Ervin, Downey, Ia.; sorrel Belgian to J. H. Lacy, Harrison, Neb.; Belgian stallion and two mares to A. Kenoyer, of Sidney, Mont.; black Percheron to Elmer Tow, Norway, Iowa; brown Belgian to J. Schneider, Elkader, Ia.; blue roan Belgian to H. C. Greengo, Glenville, Minn.; roan Belgian to Wilson Reed, Morning Sun, Ia. Besides sending us the above information, he writes as follows: So well was I prepared for the usual growth and increase in business that the above sales have not left me with an empty stall to pick from. Men are in need of a Belgian and who are ready to buy very seldom leave here without a good horse.

I have a barn full of good, strong colts coming three that weigh from 1,800 to 2,100 pounds, and the coming four and six year olds weigh from 1,900 to 2,400 pounds. I have no agents nor traveling salesmen; I sell all my horses myself at my farms and thereby save for my customers the agents' salaries, expenses and commissions, all of which must be added to the price of the horse. Readers in need of a good Belgian or Percheron should write for Lefebure's illustrated horse catalog and arrange to visit his stables before buying. Please mention this paper when writing.

Prospective stallion buyers will make a mistake if they fail to attend Burress Bros', auction sale of twenty-five head of Percheron, Shire and Belgian stallions at Carroll Stock Pavilion, at 1:30 p. m., Tuesday, February 11, 1913. These horses are all good individuals—big, young, sound and of good colors. Silver, the only Shire in the sale, is a big dapple gray, 4 years old, weighing nearly a ton. He won first at South Dakota and Sioux City fairs, 1912. Frank, a coming 3 year old Belgian, who won first at South Dakota and second at Sioux City fairs, 1912, is an exceptionally well made colt. His dam, Laura De Rollingham, won first and sweepstakes at Nebraska State Fair as a 3 year old in 1908. A few high class grade stallions carrying several crosses of pure blood will be sold. Come to Carroll February 11, view a string of good ones, and buy a dependable stallion at a reasonable price. See ad in this issue.

L. F. Newbold of Minden, Neb., has some good registered Percherons advertised for sale in this issue. Look up the ad and then write him for further information.

Look up the advertisement in this issue of "Box 327," Dighton, Kas., and you may find something in it that will interest you.

Bell Bros., Wooster, Ohio, writes: "A daily horse show is being held at Wooster now and we are visited every day by men from all over the country. Our horses are in splendid form and we can please all the critical buyers who are now making their selections. Our sales are good and among the horses sold last week are the following: The celebrated roan three year old Belgian stallion "Marichau," third prize at Brussels, champion at the Ohio, New York and Michigan state fairs and fifth at the International, has been bought by Messrs. Cooper & Burton of New Castle, Pa. These experienced and widely known stallion owners and breeders, examined the entire show of Belgians at the International this year and selected this horse as their choice for their good stock raising county. Messrs. A. Stump & Son, Elkhart County, Indiana, long customers of ours, bought the four year old Belgian stallion "Malin," and the black Percheron stallion "Karmaux." The former horse headed our stud the past season and the latter horse was a prize winner at a number of state fairs this season. The Messrs. Stump certainly have a grand pair of horses that their customers will appreciate."

Frank L. Stream of Creston, Iowa, writes that he will have a new importation of Belgian and Percheron horses to arrive at his barns February 7th, 1913. Mr. Stream invites all his old customers, and new ones as well, to come and see this load of horses as they will be the largest and heaviest he has ever imported.

Stephen Holtkamp, Pilot Grove, Ia., is advertising his Percheron stallion, Halpine, for sale in this issue. Look up the ad.

If you are looking for a bargain in the way of a Percheron stallion, don't fail to read the ad in this issue of E. P. Chapman, Prescott, Ia.

Two black Spanish jacks are offered for sale in this issue by Julius Lebantschnig, New Douglas, Ill. Don't fail to read the ad.

A. M. Ford of Illiopolis, Ill., is advertising a Percheron stallion and a good black jack for sale in this issue. If you are interested, look up the ad.

F. P. Anderson of Morrisonville, Ill., is advertising a Percheron stallion for sale in this issue, or trade for young stock. If interested, look up the ad and then write him.

If you are in the market for a jack, don't fail to read the ad in this issue of Hampton Bros., Winchester, Ky. They are advertising ten jacks from one to six years old.

If you have some brood mares that you would like to exchange for a French coach stallion, read the advertisement in this issue of H. E. Patterson, Avoca, Ia., and then write for full particulars.

S. Metz & Sons of Homewood, Ill., breeders of Percherons, Belgians and Shires, start their ad in this issue. If you are in the market for stock of this kind it would undoubtedly pay you to investigate what they have.

G. H. Minton of Forest City, Mo., is advertising some good jacks for sale in this issue. Look up the ad.

Wm. Williams of Bryant, Ind., is advertising a good Percheron stallion and a filly for sale for $400. If you are interested, read the ad in this issue and write for particulars.

J. C. Kerr of Wichita, Kas., starts his ad in this issue. He is advertising 33 head of jacks and Percherons and invites inspection of his stock before buying elsewhere.

Any one in the market for a jack or jennet should not fail to read the advertisement in this issue of W. C. Filthen, Richville, Minn. He has some that he will sell cheap in order to move them quickly.

It would undoubtedly pay any one

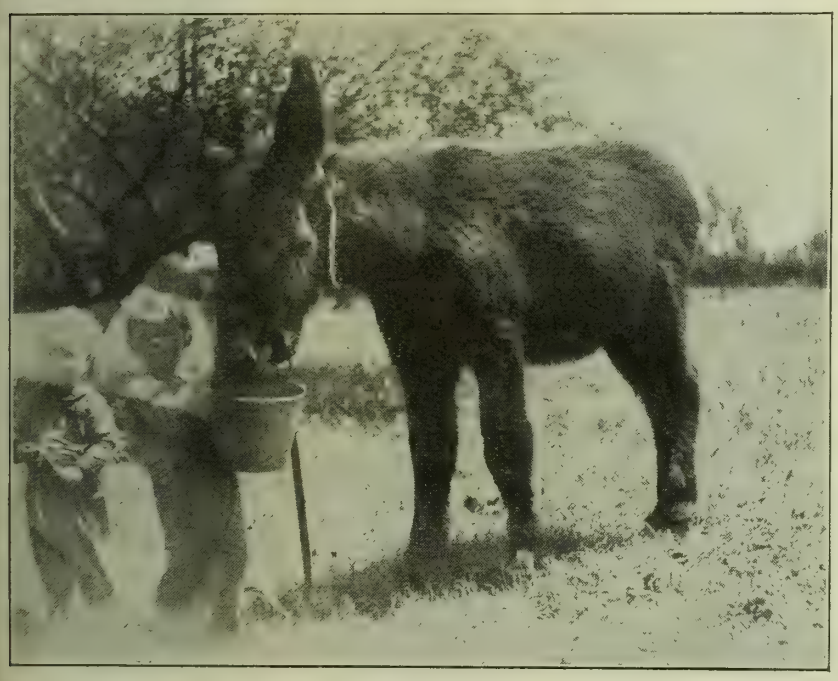
in the market for a jack or jennet to investigate what Allen B. Harlan of Columbia, Tenn., is offering for sale. His ad appears in this issue.

T. H. Early of Centralia, Mo., starts his ad in this issue. Write him for particulars about the jacks he is offering for sale.

John W. Waddill, Brashear, Mo., writes: "I like your paper exceedingly well, and I am selling horses faster than ever before. Quick sales and small profits is our motto. We still have plenty of good young draft stallions two years old, weighing close to a ton, and sound and all right in every way. I must say that I have some of the best Coach colts of my own raising you ever saw. You will hear from them later on. Besides we have some fine fillies of our own raising. Belgians, Percherons and Shires. We have yearling fillies weighing better than 1400 pounds, and good enough to win in any show ring. Will be glad to show them to any one. We have sold nine head in less than ten weeks, within a radius of ten miles—something that no one has ever done—and sold to different parties, and some of the buyers have been offered a good profit on their investment."



The progress in gasoline engine manufacture is greater than in almost any line of industry, and makes it doubly worth the buyer's while to watch out for the latest improvements. There is no engine made more strictly up to the minute than the one the Ottawa Manufacturing Company advertises in this paper. Answer the ad. It is the best way to learn how good these engines are.

Corson Bros., of Potter, Kas., start their ad in this issue. They have 40 head of jacks and jennets for sale.

bination sale under the management of C. B. Warkentin of Newton, Kas., and he should be addressed at once for catalog. The second sale is February 25 to be held at Sterling, Kas., consisting of a joint offering made by H. T. Hineman, Dighton, Kas., and D. J. Hutchins, Sterling, Kas. These offering of jacks and jennets contain probably more good, rugged, heavy boned, highly bred stock than has ever been offered in one public sale in Kansas before. Address Mr. Hutchins at Sterling or Mr. Hineman at Dighton, for catalog, and do not fail to mention the American Breeder in either case.

Thirty-five head of registered and high grade Percherons and three jacks are to be sold February 15 at auction by A. W. Williams & Son, Neal, Kas. The Percherons include a span of ton imported Percheron mares and the famous imported stallion, Tatius (45938) 29483. Much of the younger Percheron stock is the produce of this imported animal which are strongly Brilliant bred. The jacks in the sale range from four to seven years in age and in weight from 900 to 1100 pounds. One of them cost $1,000. Other important features of the sale are found in the advertisement in this issue. Address Messrs. Williams as above for sale list, and mention the American Breeder.

One of the best places for Western breeders to buy Belgians and other draft horses is from the firm of Skoog, Reed & De Cow, Holdrege, Neb. This firm not only import Belgians and Percherons, but also have an extensive breeding establishment in which high class Belgians are produced. There is never any trouble in securing horses there which are in shape to do well under Western conditions.

THE YOUNG SONS OF JULIUS LEBANTSCHNIG STARTING EARLY IN THE JACK BUSINESS.

If you are in the market for a jack write to H. V. Somerville, Oxford, Miss. His ad appears in this issue.

Orville Mills, Cedar Vale, Kas., is in the market for a Percheron stallion, Percheron mare and a jack, and would be glad to hear from any one having such stock for sale.

C. R. Doty & Son of Novelty, Mo., are advertising some good breeding stock for sale in this issue at reasonable prices to move them quickly.

D. K. Roth of Gibson City, Ill., starts his ad in this issue. Mr. Roth imports and breeds Belgians and Percherons. If you are in the market for stock of this sort, don't fail to look up his ad, and then write for particulars.

If you are in the market for a jack, look up the advertisement in this issue of W. H. Alexander, Lynnville, Tenn. He might have just what you are looking for.

J. F. Taylor of Foley, Mo., is advertising a registered jack for sale in this issue, or he will trade for mules or cattle. If interested, read the ad and then write him.

The American Breeder is fortunate in being able to offer to its readers the advertising of two of the most substantial and reliable automobile manufacturers in America, namely, the Hudson Motor Car Co., Detroit, Mich., and R. M. Owens Co., Lansing, Mich. A handsome advertisement for both these companies appears in this issue and we do not hesitate to recommend either to any of our readers who have automobiles to buy.

We wish to call especial attention to two important sales of draft horses, jacks and jennets to be held February 24 and 25 at Halstead, Kas., and Sterling, Kas. The first sale is a combination sale under the management of C. B. Warkentin of Newton, Kas., and he should be addressed at once for catalog. The second sale is February 25 to be held at Sterling, Kas., consisting of a joint offering made by H. T. Hineman, Dighton, Kas., and D. J. Hutchins, Sterling, Kas. These offering of jacks and jennets contain probably more good, rugged, heavy boned, highly bred stock than has ever been offered in one public sale in Kansas before. Address Mr. Hutchins at Sterling or Mr. Hineman at Dighton, for catalog, and do not fail to mention the American Breeder in either case.

The writer recently heard several practical horse men discussing the methods of Prof. Jesse Beery, who advertises regularly in these columns, and every man in the discussion agreed as to the value of the information which Prof. Beery offers.

Our readers will note from the enlarged advertisement of the Blue Valley Stock Farm at Blue Mound, Kas., that an addition has been made to this well known firm of Belgian and Percheron importers and breeders. By the new arrangement the Blue Valley Stock Farm associates itself with a big establishment in Belgium, which gives special facilities for getting better horses and getting them at the best possible terms. Already one very fine importation has been received under the new management. The firm name now, as will be seen by the advertisement, is W. H. Bayless, Dero & Co. The address is as before, Blue Mound, Linn County, Kas.

Some interesting information about opportunities for land buyers in Southwest Colorado are contained in the advertisement of W. L. Morse, Mancos, Montezuma County, Colo.

The blood of two of the most famous jacks in the West, Pharoah, the Tennessee grand champion of two years, and High Tide, a $2,030 Missouri jack, will be the feature in the big sale of jacks and jennets to be held at Sterling, Kas., February 25, under the management of H. T. Hineman, Dighton, Kas., and D. J. Hutchins of Sterling, Kas. Write either of these gentlemen at once for illustrated catalog, and mention the American Breeder.

THE HORSE BREEDING SCHOOL

Last Term This Season, February 17 to 22

Breeders with money invested in the business cannot spend a week's time and their tuition fee to better advantage

Whether it is you or your son who is coming, do not fail to read what these graduates say about the character of this school. We have never had room in our announcements for all the good letters we received. The ones printed below, all received since the last term, have never been published before.

I have attended the school and find every lecture or demonstration worth my expenses.—Fred Boester, Winchester, Ill.

I have attended the school and find that it is a school of high moral standing, and no one can attend it without getting the worth of their money.—G. W. Underwood, Valley Center, Kas.

I think this school is the best thing for stock men I ever attended. I don't see how we can get along without it.—Charley Zollar, Tonti, Ill.

I have attended the school for the second time and am much interested in the high class instruction, and gladly decommend it to any progressive breeder.—Wm. Freitag, Minier, Ill.

I think it will pay anyone in the horse breeding business to attend the Scientific Breeding School. —C. T. Loomis, Jewell, Kas.

I have handled stallions and jacks for forty-six years and thought I knew the business pretty thoroughly, but one week at the Graham School was a surprise and an eye opener.—H. F. Fox, Sedan, Montana.

I have attended the Graham Scientific Breeding School and think it is one of the greatest things in the world, and anyone that is in the business of horses and jacks, should attend.—J. J. Smallwood, Denlow, Mo.

I have attended the Graham Scientific Breeding School and I think that I have been repaid many times the cost. Any stallion keeper should attend. It is conducted on a strictly moral plan and I would not hesitate to send my boy there and feel sure he would be guarded from going wrong and would come away better prepared to resist the evil ways of the world.—J. G. Arbuthnot, Cuba, Kansas.

I can heartily recommend the school as an institution of high character. The moral influence I have received from one week's stay at the school will be worth many times the amount of tuition to my wife and four little boys. The able lectures are the best in their line the country affords. No father should hesitate to send his boys.—C. L. Clayton, Wakefield, Kas.

I have attended the Scientific Breeding School and am pleased with the way it is managed. It is very instructive and a place where no man need be afraid to send his boy.—W. T. Campbell, Elsmore, Kas.

After several years, acquaintance with Graham's Scientific Breeding School, through the columns of the American Breeder, I was able to accomplish a desire of long standing, and many disappointments, by attending the January, 1912, term. In common with the declaration of many classmates I do not hesitate to say that the lessons of any one or two days amply repaid the full cost of the trip, the time and the tuition. Nor can I do less than say that the high moral influence of the management and of the many Christian members of the class will be one of the pleasantest memories of my life, and so long as I shall put in practice the teachings of the school I shall rejoice that so many clean men are proving that no odium of necessity attaches to business of using the laws of nature's God in producing horses.—D. M. Johnston, Storm Lake, Ia.

I have been very much impressed with the way this school was carried on this term. It was a success from beginning to end. The instructors are better than before, and I am perfectly sure that a father can send his boys to this school without any risk.—H. D. Penner, Potwin, Kas.

I have attended the school and think it is all right. You need not be afraid to come and you need not be afraid to send your boy. I was much pleased with the school.—Jas. H. Hall, Whiting, Iowa.

I have attended the Graham Scientific Breeding School and learned the wonderful value of this school, both morally and scientifically. Parents should send their boys to this school. I advise every breeder to attend this school.—A. A. Williams, Conway, Kas.

This is my second term to this school and I can see a great improvement over the former term, especially in the moral character and the way the professors delivered the lectures. The school is a great place for any horse man to attend.— E. J. Brouhard, Colo, Ia.

I attended the Graham Scientific Breeding School and found it excellent, and cannot see why any breeder of pedigreed horses and jacks can get along without this fine work, for what little time and small amount of it, will cost to get this good session.—Peter Yung, Jr., Salisbury, Mo.

I have attended the Graham Scientific Breeding School and think it is O. K. I think all horse breeders and mare owners ought to attend one term.—J. F. Foster, Oregon, Mo.

I have attended the January, 1913, term of the Graham Scientific School. Am very much pleased with the work and the manner in which it is carried on. I think it very essential that every mare owner or horse breeder should attend. — H. B. Woolsey, Maquon, Ill.

I am well pleased with what I have learned at the school. Any one lecture is well worth the cost of the term.—Frank Countryman, Thayer, Kansas.

This is my first term and will say that in the first two lectures I received information enough to fully repay all my expenses. Furthermore, the moral influence of the institution is beyond reproach.—H. C. Brenizer, Abilene, Kas.

As a student of the Graham Scientific Breeding School, will say I am more than pleased with what it gives. First, it makes better men of its students—gives them a better knowledge of the laws of health of both man and beast, as well as giving the knowledge of the breeding problems that are confronting us in this day. It is a progressive movement.—J. M. Seward, New Providence, Iowa.

I have attended the January term of the Graham Scientific Breeding School. Every stallion or mare owner should attend this school for the benefit of the horse industry of our country, and also for its moral influence. Any parent need not hesitate to send their sons to this school. I would advise any one who intends to stay in the horse breeding business to attend this school. I cannot praise this school enough for the good it is doing in this country in this respect.—Henry J. Stuhr, Minden, Ia.

This is my second term at the Graham Scientific Breeding School. I think it is a great thing for stock breeders. Every man that handles stock ought to take a course. It means better farms, betters stock and more money for the farmers.—J. R. Brooks, Cairo, Mo.

I have attended the Graham Scientific Breeding School and must say I cannot place a value on the information which I have received, as one lecture alone was worth many times the cost of tuition, and must recommend it to others. Parents, don't be afraid to send your boys, for they can't help but come home better men and will be of much good to the community morally.—Carl O. Williams, Kempton, Ind.

I attended the last term of the Graham Scientific Breeding School and cannot say enough for this school. In the first place all of the instructors are of the highest moral character. As to the value of this school in dollars and cents, I cannot express it. Each and every one of the lectures is worth more to me than what my tuition cost me. The one lecture on "Germs" is worth everything to me. I cannot understand how I got along before. I wish that every farmer and his boys could attend the next term.—Louis Knopp, Cole Camp, Mo.

I have attended the Scientific Breeding School and will say it is a place where you practically get something for nothing, considering what it cost, especially, not only from the breeder's standpoint of view but of the moral character of the instructors and of the morality taught in the school. Would not take $1,000 for the information I got there.—R. A. Fitzgerald, Bucyrus, Kas.

I attended a term at the Graham Scientific Breeding School and am very pleased with it. I think everybody interested in horse breeding ought to attend. Any one of the lectures is worth all it cost me and everything was conducted in a nice, moral way.—J. J. Schenk, Allison, Colo.

The character and morality of this school is above some of our state institutions. I am a booster for scientific breeding, and every mare and stallion owner is doing himself and his community a financial and religious injustice in not attending this school.—Ray Johnson, Union, Ia.

I believe the Graham Scientific Breeding School is a good thing, and it is not only a good thing for every breeder to know, but it teaches a good many things that everybody ought to know. Am well pleased with the school and shall attend again later. Every man that attends is doing a great thing for his community as well as for himself.—C. H. Wempe, Seneca, Kas.

I have just finished a second term of the Graham Scientific Breeding School and can say the more a man sees of it the more he thinks of it. Any one of the lectures is surely worth the price. It is a place where no man need be afraid to send his son.—Chas. W. Stouffer, Merna, Neb.

I have just attended my first term at the Graham Scientific Breeding School and think it a great help, and would gladly recommend it as a valuable school for anyone to attend, especially all stock men and their boys.—C. H. Zachry, Merna, Nebraska.

I have attended the January term of school and think that the faculty there have a way of presenting the knowledge of scientific breeding to the student so that he cannot help but feel that he is getting the full worth of the price of tuition. The moral spirit of the place is good enough for anybody. No parent need fear for their son's welfare. Success to the school.—E. N. Irish, Blandinville, Ill.

I have attended my first term of the Scientific Breeding School and am more than satisfied with what I have learned, and wish to state that so far as I can see no father or mother need fear for the morals of their sons under such instructions, for they will gain knowledge that will raise the standard both morally and scientifically in any community in which they come in contact.—T. T. J. Parker, Laddonia, Mo.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Female Organs, Physiology of the Generative Organs, Cells, Infection, Breeding Questions, Breeding Instruments, Foaling, Scientific Mating, Horse Judging, Mule Judging, Barren Mares, Barren Stallions, Abnormal Conditions, Diseases of the Foal and Fetus, Diseases of the Male and Female, Contagious Abortion, Feeding, Testing Breeding Stock, Determining a Mare's Breeding Condition, Buying Breeding Stock, Hereditary Defects, Horse Breeding, Rectal Examinations for Abnormal or Diseased Conditions; also tell whether a mare is in foal or not. Getting the Semen, Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 a day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

BREEDING IN THE WRONG DIRECTION.

About twenty years ago, a Kansas breeder owned an extra good mare, weighing fifteen hundred pounds. He has used scrub stallions, and saved a little money in service fees but lost a fortune in producing animals that did not pay for their production. After four generations of scrub sires, the above animal is the result, which sold for $116.00 on a good market. There are a lot of farmers doing this same thing, because they never stop to think. If stock does not net a profit, why produce it?

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

BREEDING APPLIANCES OF ALL KINDS

THE CARLSON IMPROVED SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. Several imitations have been sold that have met with disappointment. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times before breaking. This makes it possible to get the semen. All necessary directions will be sent with the instrument.

Special offer: 50 pointed breeding capsules, price $1.00; a tested hot water thermometer, price $1.00; the improved Carlson semen extractor, price $7.50; all for $7.50.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickel plated, about 22 inches long, with a glass tube in it. Price $4.

Microscopes

For use in testing the semen of stallions or jacks. Made especially for this purpose. Magnifies 500 times and is used by veterinarians and physicians. Price $35. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price $1.00.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use. Price, per box (100) $1.50.

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6. Price, $2.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 to 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1914. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag. **Price, Each, $1.00.**

Speculum

Made of good material, nickel plated, easily inserted, will last a life-time.

Price, $3.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety. **Price, $1.25.**

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

Our Early Horse Improvement

Bits of History From the Development of Early "Strains." Founding the First American Breed. Influence of Outside Blood. Need of Care.

Perhaps the first improvement of any note was in the vicinity of the Allegheny mountains. A strain of bay horses about 16 hands high, weight 1,200 pounds, was originated. There were not many of these, but enough to attract attention, and these were used as wagon horses. They were good walkers and very fine lookers, but they were noted as being light in the body (a small bread basket). An occasional animal possessing these characteristics is yet seen in that section of the country.

In the hills of Vermont, and adjoining states, a demand was created for a type of horses that could be used as "truck" horses in farming the small fields in that hilly section. Other requirements of these horses during those days was to be used on stage coaches, riding purposes and a general all purpose horse with lots of staying qualities. Any one who has ever visited the hills of Vermont can readily see why such a type was originated. The strenuous requirements developed a strain of horses later known as the "Morgans." It was many years after the settlement of this country that any particular notice was taken of the progeny of any one strain of horses. Then a search was begun for the breeding of this type of stock.

The frontiersmen in Kentucky, Tennessee and adjoining states, then a new country, were greatly in need of a saddle horse—an animal that could cover a considerable distance with ease to both man and beast. A selection of sires from the Thoroughbred had developed some of the characteristics of the present small saddle horses, but a little later a pacing strain of animals was introduced from Canada or the northern states, which was crossed with the Thoroughbreds, and later carefully selecting the best sires from this union, and from development, the American saddle horse—strictly an American product—has been developed.

The frontier had been shifted farther west to the plains country, where one or more animals were found convenient for road work. From a combination of Thoroughbred, Morgan and the Northern pacing blood, the Standard bred horses have been developed. Great stress was placed on these individuals for speed purposes, at both trot and pace. The entire country soon had the pacing fever, and we might say that no other line of horse improvement has had a greater opportunity for developing one particular characteristic, and that is extreme speed for one or more miles. Out of this conglomeration of blood has developed an American product that is now sought in many countries for speed purposes.

The environments have much to do in horse breeding. During the early settlement of this country there were found in the Northwest territory, animals weighing from 100 to 300 pounds more than those found in the southwest portion of the United States. All of these horses probably originated from the same fountain head, but time and conditions have made different types, different sizes and different characteristics. This is a natural study. Again, all of the Western range raised horses have peculiar characteristics, different from those found in the corn belt. No other strain of horses in the world, regardless of blood lines, have ever had the natural staying qualities of the Western broncho under Western conditions. These horses can run farther and carry a large man and a large saddle a greater distance with scant rations than any other horses in the world.

velop in the Eastern states and farming was taking on more of a settled appearance, it was decided that larger horses were needed for the better tillage of the land. This induced the importation of a few draft stallions, which were at first criticized severely. In fact, the patronage to these sires was very limited for several years. Their immense size was thought to be unnecessary. Stallions that weighed 1,500 pounds were a curiosity and considered freaks, but in after years when a few colts were

As the new conditions began to de-developed and used, the value of these sires was considered differently. Breeders and farmers in the South and the West are just now beginning to realize the value of draft horses, the same as those farmers then living in Ohio, Indiana and Illinois, excepting that the stallions which were introduced into the Central states were of a high quality, and those which were early introduced into many Southwestern and Southern states, have been inferior in quality. This has held back the improvement of draft stock in these sections.

No other country has such a mixture of horse flesh as that of America. The settlement and improvement in this country has been very short; much of the development in America has come during the last half a century. With this settlement the immigrants have come from every civilized country. There is about as much of a mixture in our horses as is found in the human. We now have the fastest harness horses in the world; the best five-gaited saddle horses to be found, and great strides are being made along other lines of live stock.

This country being so extensive in area, varying in conditions and products of the different sections, and having so many different types of animals, makes us slow to specialize on one particular type or breed. Those who are producing animals for financial gain should study the market conditions closer. During the last quarter of a century market specifications have made numerous changes in horse breeding. There are about 20 different market types which have developed and which should be studied closely. The large cities have come into prominence as our guide in many of these classes. For intance, draft geldings are not known in the horse market as belonging to "breeds." They must fill certain specifications.

While the draft horses are being drawn from the five different fountain heads, there will continue to be a considerable difference in the types and characteristics. But should the time come when the stock will all be produced here, practically every breeder who furnishes pure bred sires to the public will be forced to adhere a little closer to one type. But that will take time. If the American people were able to get the other foreign breeds changed as the Frenchmen have changed them, this would be a noticeable step toward uniformity. Belgium breeders are beginning to see the necessity of making a few minor changes to accommodate American and Argentine markets. The American people, being a new nation settled with people from other continents, makes it possible to change the conditions more rapidly. They come in contact with other types used under all kinds of conditions, so that their judgment in this matter is greatly widened. They can see the other fellow's stock and note the advantages as well as the defects.

There is a great lesson in the vast difference between the Shire and the Suffolk breed of horses. They were originated and developed in adjoining counties in England. The great changes have been brought about largely through the selection of sires. The selection of sires means much to the horse breeders in this country. A sire is more than one-half of the herd. The value of a well bred sire cannot be described better than to mention the results obtained from using a well bred Thoroughbred, which is the running horses. When a sire of this kind is used on a pure bred mare, there is little guess work as to what the result will actually be. They cannot all be winners, but nearly ever union of this kind results in a very rapid horse. Another peculiar characteristic of this breeding is that the progeny is usually easily trained to extend themselves at a gallop. A horse of this breeding may not be used for racing purposes until well advanced in age, yet he takes to this training readily.

If we use a registered Clydesdale stallion on a pure bred dam, the result will be a Clydesdale progeny. The better the material used in this breeding the better the progeny. Pure bred strains of horses are now so well advanced that there is little guess work connected with the selection of the

STUDY HORSE BREEDING AT HOME.

With the great demand for more information on live stock breeding, we have wondered if it would be possible to prepare a series of lessons on this subject and publish them in the American Breeder. We know that we can prepare this material, but whether our readers would study it or not is the question.

Then there is another feature. The American Breeder has lost a lot of subscribers by advocating modern methods. If we would teach a lot of worthless rules that we know are not right these men would have remained with us. If we carry this farther, and start a school of real instructions, what will be the result? It is not only the loss in the subscription list, but this work will cost a small fortune. We know that an army of men need this information, and it is our business and duty to be of as much service to our readers as possible.

In private conversation with a number of readers who have attended the Graham Scientific Breeding School, they have stated that they know this information would mean hundreds of dollars to every progressive breeder. These men have said that the ordinary breeder does not really know how much there is to learn, or how much advantage it is to know these things and be up-to-date. It has been said that the wise man is always a student. One never gets too old to learn, but he who has learned a few things and believes that he has learned it all, is the dangerous man in the community. A number of breeders have pledged their support to do all they can to maintain and increase the circulation of the American Breeder, if a series of lessons were prepared and published. If we start this school, which will be known as the American Breeder's School, it is our intention to make it very complete and have much value. We will make these lessons as plain as they can be made with printer's ink. We are going to ask our readers what we shall do in this case, and how many of them will pledge their support to add ten or more new subscribers to the American Breeder this year. Notice that we make a club rate of 75 cents per year for clubs of four or more. The regular subscription price will be $1 a year, or three years for $2. There will not be any deviation from this price.

best sires. The selection of good individuals and plenty of feed will produce good stock, but if inferior material is used in a herd, or if they are stunted, little results can be expected. Poor feed and the use of inferior blood has overstocked the market with the inferior horses. An inferior sire can do more harm in a community in a year if used extensively, than several good sires in the same length of time can undo. Anyone interested in horse breeding, who cares to study the situation, must come to the conclusion that if the best profit is to be derived, good blood and plenty of feed must be used.

QUOTES COLLIER'S WEEKLY IN CONDEMNING WISCONSIN STALLION LAW.

To the American Breeder: I have been a subscriber to your valuable paper ever since its first issue. Have paid up my subscription for three years in advance, and intend to continue it. I learned things from your first issue which I was unable to learn elsewhere about the breeding business, and I think it the best instructor we have. I am not a writer for any publication, but thought I would send you a few lines about what is being done here.

I have been breeding Percheron horses the past thirty years, beginning with a recorded stallion and afterward breeding recorded stallions and mares. After the Wisconsin law was passed that we should have licenses for our stallions, I got a license for mine according to this law. One of my stallions had a small lump in his throat which may have been caused by taking cold or distemper, which slightly affected his breathing. Some one from avarice or spite sent in a complaint of unsoundness to ———— and he took my license from me and called for satisfactory evidence of soundness before he would return it. I told him I would put the colts of his getting in evidence of his being free from transmissible unsoundness. His reply was: "Proof relative to soundness of colts is not mentioned or considered in the law."

One of the most important things in horse breeding—sound, healthy colts—is not even mentioned or considered in this infamous law which he formulated and got passed by the legislature and intends to enforce on the people of Wisconsin. This happened about three years ago. In Collier's National Weekly of October 10, 1908, is an article by Joseph Medill Patterson in which he says the passage of this law was secured by concealing the full import of it, even from the legislators, until after they had passed it. Three years ago, according to the Wisconsin stallion directory, there were within a radius of ten miles of my place, ten stalllions classed as "scrub, mongrel and grade," licensed and in good standing, and seven recorded stallions of the different breeds. By this directory for 1911 there were fourteen "scrub, mongrel and grade," and only three recorded stallions. I have thought from the beginning that this law was unconstitutional. It did not help me collect my fees, but I was liable to criminal prosecution and fine and imprisonment if I failed to observe it. I have disregarded his law and defy any faker to fine and imprison me. There is not an unsound colt from my horse that I have ever seen or heard of. They are selling for as high prices as any others in this country. One of the best veterinarians here examined the horse and advised the man who cared for the horse this year to mind nothing about ———— but to go on and attend to his business.

I see in your last issue an article about horses' feet. This horse has as good feet as any I have ever seen of any breed, which is transmitted to his colts. There are but few people here who take interest enough in breeding good horses to induce a man to keep a good stallion. There are several scrub mongrels hawked about the country, breeding the mares on the owner's premises, which get over 100 mares each season.

To illustrate, I will give you an instance where a horse made up of four or five different breeds, which was bred and raised on a farm two miles from mine, and used as a common work horse, and his owner obtained a license from ———— and used him for breeding purposes as well as work for two seasons, then sold him. The last year he owned him he got nine colts in my immediate neighborhood, seven of which are dead, and the two living are only common, ordinary colts. Dead colts from a mongrel like that are like dead rats in comparison with those bred from a good recorded horse, are the most valuable kind for the owner. The man who purchased this horse had another which might be classed as a mongrel and made it his special business to take them around wherever he could get any business, and I was told, on good authority, that he bred 115 mares with him in one season. The same year I bred 17 mares at my place with a recorded Percheron horse weighing 1900, which has left some of the best colts to be found here. He was too good a horse for this country and is now in California, where he is well liked and his services will be appreciated. I was sick last winter with pneumonia and was compelled to sell all of my stock, as I was unable to take care of it, and my health is ruined so that I can never take part in active farming operations again. Even if I could I would not feel justified in making a purchase of one of the best stallions to bring here under existing circumstances.—E. Fish, Rock county, Wis.

IS HE TOO FAT?

To the American Breeder:—I have a Percheron stallion coming 5 years old. He is very fat. He has a stall 12x20 and a large lot to run in and when I work a team I put him in harness. He is a free worker and feels fine, not lazy like some of the fat stallions. This horse gets only 1 quart of oats and 2 ears of corn three times a day and some clover hay. Would you take all corn from him until I begin plowing in the spring? Some of the stallion owners tell me I had not ought to work my stallions through the season in the plowed fields. I work them the same as I do my mares, to whatever I want to do. I bred 90 mares to this horse and there are 68 safe in foal. I used the capsule some to help him out.—B. E. Lite, Davis County, Iowa.

TENNESSEE AGAINST SPAIN.

To the American Breeder:—I notice in your valuable paper of January 20, D. S. Sprague, Clark County, Ohio, giving a description of his imported Spanish jack. I cannot equal him in every respect, but can surpass him in some measurements. I have a Tennessee raised jack, three years old last August, that measures 15¾ hands high; from the tip of his nose to the crown of his head, 31 inches; girth, 68 inches; flank, 67; arm, 20 inches; knee, 15¾ inches; below knee, 9 inches; hock, 20 inches; below hock, 10¾ inches. The time is coming and even now is at hand that you do not have to leave the grand old state of Tennessee to find a good jack. So let us hear from the stockmen giving the measurements of their jacks. I know of jacks in Tennessee that will surpass either of these jacks, and like the Ohio man, I would like to hear from the stockmen of the different states giving the measurements of their jacks.—J. T. Pylant, Lincoln county, Tenn.

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

Amount of Feed for Mares—Is four pounds of good oats and three ears of corn twice a day enough grain for a 1,500 pound mare that is not used? Mare is seven years old; has the run of pasture through the day and kept in barn at night and given hay; sometimes they are given one or two pounds of alfalfa hay each. These mares will foal mules sometime about April 20.—Missouri Subscriber.

REPLY—We should say that these rations should be ordinarily satisfactory for the average mare if there are straw stacks or other roughness available in the pasture. But there are no two horses exactly alike in regard to feeding. Every feeder should learn to judge the condition of animals. The bowels is one of the best guides. If the bowels are too loose, a part of the laxative feed should be reduced; if it smells extensively, too much grain is being fed. At this time horses, as a rule, should be kept in a good physical condition, but not exceedingly fat. All breeding stock should be fed with as much regularity as possible and avoid all abrupt changes that are likely to physic the animal. The digestive tract and the genital organs are so closely associated that an excessive movement of the bowels frequently causes a disturbance that may expel the fetus.

Abortion—My neighbor bought a mare there months ago and was told that the mare was in foal. The mare was healthy all the time and is now. On the 22d day of January she dropped a dead colt and it was rotten; had no eyes; just had spots in places and had no hair on him; was size of a small dog. The mare had milk a month before she dropped the colt. When he bought the mare she had distemper. He smoked her with old shoes and chicken manure, which he thinks was the cause of her having a bad colt. Can he breed her again? And was that the cause of the trouble?—Arkansas Subscriber.

REPLY—We cannot say just what caused this abortion, but would advise our readers not to use this treatment as it is ridiculous and any intelligent man should know better. It is strange what ideas some men will get into their heads. This mare should be cleaned up by a qualified veterinarian and should not be bred for several months.

Four Year Old Services—I have a jack that will be four years old the 5th of July. He is 15½ hands high and weighs 850 pounds. How many mares ought I breed him to this year to not impair him and to make a success? I have a pasture which joins his stable lot that I let him run in all the year. Is that all right?—Mississippi Subscriber.

REPLY—You can breed one mare a day with this jack and let an occasional day slip. We would not advise two mares on any one day. Your jack is growing nicely but does not have a good bread basket. If he is not crowded and is well cared for, he may get heavier and spread out. Your pasture and barn are ideal.

Breeding Three Year Old Fillies—I have a heavy draft mare which will be three years old the first of June, and expect to work her next spring; she weighs 1,200 pounds. Do you think her too young to breed and have her foal a colt at four years of age, or wait until she is a four year old and then breed her to foal at five?—South Dakota Subscriber.

REPLY—Your mare should be bred next spring and put to work, but do not work her extensively and be liberal with the feed. Keep her growing nicely. Select the best stallion you can find, regardless of price, and try to raise a bigger one. Your mare is undersized; she is not a heavy draft mare.

In-breeding Jennets—How will it do to breed jacks back to their mothers? —Mississippi Subscriber.

REPLY—It is not advisable to breed jennets back to their sons. You had better ship your jennet to the biggest and best jack that you can find, if there is not one in your community. Arrange for pasture so that the jennet can stay several months, and be sure she is in foal before bringing her home.

Standard Bred Horses—As I am new in the horse business I would like for some one to tell me what is a Standard bred horse. I understand what a pure breed, or cross bred, or grade horse is, but I don't know what breeding a horse has to have to be a Standard bred. If some one will explain this to me I will be very thankful.—Illinois Subscriber.

REPLY—Trotting and pacing horses have been registered according to certain standards of speed. This was the foundation and is yet used in connection with registering horses so that the word "standard" has its meaning with this class of horses. They are registered in the American Trotting Association, Chicago, Ill., Frank E. Best, secretary.

Raising "Hinnies"—May I inquire as to whether we could have any luck or success breeding jennets with the capsule system, as our horse will not cover a jennet.—Nevada Subscriber.

REPLY—If you can deposit the semen of your stallion in the uterus of a jennet in a natural, healthy condition, at the right temperature, regarding the laws of cleanliness, you can make a success of breeding jennets with the capsule system. You will find full instructions concerning the capsule method in a later issue.

Crooked Jack Colt—I have a fine jack colt, four months old, which knuckles over forward in his front ankles. I have put irons on him; his ankles became sore. Could I put him in plaster paris? Please give me some advice.—Tennessee Subscriber.

REPLY—We would not advise putting this colt in a plaster paris cast. Teach him to eat feed and as soon as possible wean him. Arrange the feed so that it is not necessary for it to reach down; have your feed box and manger high enough so that it can eat standing up erect. Your colt will improve more rapidly after it is weaned. It is probably too tall to reach down to suckle the jennet. Teach the colt to drink cow's milk by giving it a very small quantity to begin with and gradually increase the amount. Be very careful that the vessel that contains the milk has been thoroughly cleaned. Have your blacksmith prepare shoes with a projection extending out about an inch in front of the foot; have this projection bend back to the hoof so that it will not be catching on things. Pare the heel down enough to give the foot the right angle. Allow the colt a reasonable amount of exercise so that it can move around at its leisure. Nature will do much for a patient of this kind.

Unthrifty Mare—I have a five year old mare that does not do well; has a good appetite; hair rather rough; hide bound slightly; doesn't always digest her food properly. She has been this way since three years old, when she raised a colt.—Colorado Subscriber.

REPLY—Have a good veterinarian examine the teeth; also have your

veterinarian make an examination of the uterus, which may be in a very badly diseased condition. Give this mare plenty of alfalfa hay and oats, with plenty of freedom.

Rank Stallion—What is the trouble with a stallion that comes off a mare with an enlarged penis? This causes him to draw a large portion of the semen.—North Dakota Subscriber.

REPLY—Your stallion dismounts too quick. Let him have a little more rope while serving mares. Allow the mare to take a step or two if she wishes. You have probably noticed that he does not do this on large mares as he does with smaller ones. Encourage him to stay on just as long as possible.

Shy Breeding Stallion—I have a stallion that is ten years old and he has not brought over 40 per cent of mares in foal all his life. Would it improve him to put him to work?—North Dakota Subscriber.

REPLY—If you will work your stallion enough for sufficient exercise it will be beneficial, but the principal thing for you to do is to learn more about the breeding business. If this stallion gets 40 per cent of his mares in foal, why does he not get more? That is the question for you to study. When a stallion gets 40 per cent we know that he is discharging live spermatozoa at times. Get a microscope and test the semen at every service and keep a record of the times that fertile semen is discharged, then you will know how many services to make. When live spermatozoa are deposited in the uterus of a mare, and she does not fertilize, it is the fault of the mare and not the stallion. You have either bred too many mares or you have been breeding diseased mares. Work for stallions is only intended to build up their physical condition.

Registering Jacks—What are the requirements to have a jack registered, and where must I write?—Colorado Subscriber.

REPLY—Write to Wm. E. Morton, 920 Scarritt Bldg., Kansas City, Mo., for application blanks. If your jack measures 58 inches from the highest central part of the withers to the ground; 62-inch heart girth and seven inches around the front leg at the smallest part between the knee and ankle, he can be registered. The owner of every jack that will meet these requirements should send at once for application blanks and have it registered.

Raising Mules in Montana—I have been thinking of going to Montana and taking a homestead with the idea of raising mules or cattle. There would be three or four of us go and locate close together and work the stock business together. Our idea was to get good, big Montana mares and take a good jack from here. I have handled stock all my life in Illinois, but have had no experience in the West. Of course I know it will be different there; that is the reason I would like to have your idea. Any information you may give me in regard to this will be greatly appreciated. Would also like your opinion in regard to location if you have any information on government land in Montana. We would expect to raise grain to feed the young stock so as to keep them growing from start to finish.—Illinois Subscriber.

REPLY—Write to the government land office at Helena, Montana, for a description of the government land which may be homesteaded and such other information as they are able to furnish you. Most of the valuable land has been taken, but there are locations that might be of some advantage to you. The best thing for one to do is to take a trip to that section of the country and first select your location and study the conditions. A little time making yourself familiar with the new country will be very profitable. You will find drawbacks as well as advantages in every section. It is usually better to take breeding stock, and especially jacks, from Illinois to Montana in the fall, so that they will have an opportunity to become acclimated and ready for the spring service. There is a great demand for big

(Continued on page 30.)

Producing Cavalry Horses

The Western Range, Rather Than the Corn Belt, Seems Suited to the Breeding of Cavalry Horses on a Practical Money Making Basis.

An idea of the conformation and general make-up of the ideal cavalry horse is not easily obtained from the individual animals in use today. Occasionally an excellent animal is found, but the majority of them are not what they should be at the present time; and those which are called passable are not easily obtained at the prices offered. A great many breeders who have formerly tried to produce cavalry horses have gone into other lines of breeding. Some of them have stated that there was little profit in it If cavalry horses cannot now be purchased at a reasonable price compared with other horses, what can the government expect in the future?

The common method of buying cavalry horses has not met with general approval. A contract is let for a certain number of horses filling cavarly horse specifications. The original contractor makes sub-contracts with other individuals, and they in turn make other contracts. Each one of these contractors must necessarily make a profit, so that on the producer falls the expense of feathering the nest of numerous middle men.

Again there has been talk that some one connected with the purchasing of these animals for the government must be reckoned with. We do not know just how serious this matter is. We do know that the government is having great difficulty in finding the right kind of horses at a cost satisfactory to the War Department.

During the last few years the scarcity of these horses has caused the government agents to try different experiments in the way of producing a better and more uniform class of horses for cavalry purposes. Stallions have been purchased and stood at a nominal fee by the government. To encourage the production of this type, breed associations have studied these questions seriously with a view of encouraging the use of a particular breed for cavalry horses. This has especially been encouraged in the corn belt, but the farmers are not very much enthused on the subject. They have realized that they can breed horses to fill other market requirements, and realize a greater profit. We do not believe that the farmers who have an abundance of feed can afford to raise cavalry horses. If every animal produced would meet the specifications it might be profitable where an individual owned mares that were of this particular type. But they are not all cavalry horses; many of them are rejected and those which do not pass the required examination have little value and are produced at a loss.

There are thousands of stallions in the different light horse breeds that can produce good cavalry horses. The rational proposition in this case is to select stallions that have actually produced a large per cent of cavalry horses. Again we wish to emphasize a point we have often made, that a successful sire is the one to choose for a given type. These successful cavalry horse sires can be purchased cheap; they can be found of from six to eight years of age that have not had excessive service. Why not purchase these stallions and take them to the government reservations where horses can be raised cheaper and more satisfactorily for this particular purpose than anywhere else in the world. Western mares make excellent dams, for they carry with them the characteristics of the Western broncho that has been raised for generations in the open air and are familiar with hardships. By using a hot blood sire on the mares a good type can be produced that cannot be excelled for this purpose anywhere else in the world. A band of 25 or 40 mare can be turned loose with a government stallion—each animal having the government brand—and in addition to the government brand a hoof number can easily distinguish each animal. A record of all breeding operations and description can easily be kept.

It is already necessary to patrol a large number of the government reservations, and these animals could easily be protected without much added expense. Reservoirs could be made and certain winter ranges could be provided with emergency feed so that a very little loss would result from winter storms. A little band of mares of the right kind, having plenty of hot blood could be maintained and the true cavalry type from a breeding standpoint, could be established so that in the future the studs could be replenished without so much effort and a more satisfactory strain of horses would be the result.

We believe that if this plan was in operation with a few details worked out, the best results could be obtained. If the feed situation was not satisfactory for the development of the progeny, the geldings could be separated either at weaning time or as yearlings, and taken to a location where better feed and a greater opportunity for advancing the growth could be had. A similar experiment has been going on in Oklahoma where colts have been purchased and developed. These have given fairly good results except that the type has not been as well maintained as was expected. In a breeding project of this kind there would necessarily be some rejects that could be condemned and sold for enough to pay for their maintenance. The mares could be retained on the range and separated and placed with another stallion. There are plenty of reservations (now being occupied by an inferior class of stock) that could be stocked as we have indicated above to a good advantage. Most of these ranges (on which it is a considerable distance to water) can be utilized better with horses than any other kind of stock. Horses also fare better in winter as they are usually good rustlers and can uncover the grass in times of snow. With an emergency supply of feed and water horse stock can be produced easily and with good results. Utilizing this range would afford an opportunity for the employment of a lot of soldiers instead of keeping them in a single camp a great length of time.

The cavalry horse problem is not peculiar to America. All nations are having similar trouble in supplying animals of this type. In England the breeding of hunter horses is greatly encouraged by the government in order to produce a type of animal of good conformation, rapid on foot, good jumpers and with lots of staying qualities. France has developed perhaps a half dozen different breeds of horses in trying to establish a particular type that would produce cavalry horses with as few failures as possible. They have given up the idea of any particular breed, but when a stallion is found that will produce a high per cent of cavalry horses, he is purchased by the government and stood for public service at about a four-dollar service fee. Other countries have different methods of encouragement. We are of the opinion that if the United States produces a good number of cavalry horses the government must increase the purchase price for individuals ready for service or breed them from the Western range mares.

Under the provisions of the current appropriation act for the Department of Agriculture, authorizing the inauguration of experiments in the breeding of horses for military purposes and providing $50,000 for that purpose, the secretary of agriculture, with the concurrence of the secretary of war, has appointed the following gentlemen as advisary agents in the selection of stallions and to assist in the operation of the government's plan: Mr. Henry Fairfax, of Virginia, for Thoroughbreds; Mr. C. L. Railey, of Kentucky, for American Saddle horses; Mr. Walter Palmer, of Illinois, for Standardbreds; Mr. Maxwell Evarts of Vermont, for Morgans.

Each gentleman acts with the officers of the Government in the selection of stallions of the breed he represents. The secretary of war has designated Lieut. Col. D. S. Stanley of the Quartermaster's Corps to represent the army, and the secretary of agriculture has designated Mr. George M. Rommel, chief of the Animal Husbandry Division of the Bureau of Animal Industry, to represent the Department of Agriculture.

Thirteen stallions have been purchased to date, as follows:

Thoroughbreds—Gold Heels, by The Bard; dam, Heel and Toe. Charcot, by Common; dam, Spanish Match.

Saddle Horses—Young Bill, by Golden King; dam, by Bourbon Chief. Fair Acre King, by Bourbon King; dam, Aletha Chief. Richmond Choice, by Rex Peavine; dam by King Richard.

Standardbreds—MacNunne, by MacDougall; dam, The Nunne. Sigler, by Red Medium; dam, Maud Sigler. Be-Gue, by Wiggins; dam, Lady Crescent. Twilight M., by Delmont, Jr.; dam, May Fry. Lord Rion, by Orion; dam, Madge Fullerton.

Morgans—Daniel Webster Lambert, by Joe Allen. Madison Lambert, by Lambert B. Prince M., by Ethan Allen 3d; dam, Topsy M.

All of these horses are well bred and registered, and some are well known individuals. Gold Heels, for example, had a conspicuous career on the turf; Common, the sire of Charcot, was by Isonomy, winner of the Derby and other important stakes in England. All the saddle hores thus far purchased have had winning records at the Kentucky fairs. Of the Standardbreds, MacNunne is notable in that he, like Carmon at the Colorado stud of the Department of Agriculture, is a grandson of Robert McGregor. Sigler was first in two-year-old class for Standardbred trotters at the National Horse Show in 1911; and Lord Rion's sire, Arion, sold for $125,000. The Morgans thus far purchased are excellent representatives of the breed and should prove useful as sires of cavalry horses of good size and conformation. The sire of Prince M, Ethan Allen 3d, has left a remarkable impress on the character of the Morgans of the east side of Vermont.

The Department of Agriculture expects to make other purchases during the winter.

WORKING THE STALLION.

To the American Breeder:—This has been a fine fall to prepare stallions for the coming season; fine fall to plow and a better place never was to break a stallion, than in the furrow. Hitch him up by an old mare and tie him so he will have to work. Don't say stallions are too valuable to work, as they are not. I heard a man say that they were too valuable to work. He has a top cross or grade horse that hasn't breeding enough to cover a postage stamp, and he bought him for $265 at auction.

Men, there is too much of this kind of work going on. Buy a good registered horse and work him in the harness every day all winter and from two to four hours a day all through the season. A "Humane" collar is a very fine collar for a stallion. I have worked one on a stallion for over two months; plowed, and did all kinds of work without hurting a single hair on his shoulders, and he will go on the stud in fine shape. Advertise in the spring that your horse has been worked all winter and that you are going to show your patrons the semen so they will be satisfied the horse or jack is all right. Don't be sending in questions to the paper as to what is the matter with your horse, "He just rubs all the time." He needs more exercise; that is the main reason our per cent of foals is falling all the time. We are abusing our stallions worse all the time. The fattest and finest will do for the show ring, but not for the stud.—E. E. Hall, Anderson County, Kansas.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the

UNSOUND BREEDING STOCK.

It matters not so much when unsound animals are produced or who produces them. Nearly every one of them with a good pedigree will find its way into the breeding ranks somewhere. It may be rejected in one state, but this is a very large country, peopled with "many men of many minds;" some one will use this animal. This is a very broad and important subject when we take into consideration the individual who produces an unsound pure bred animal.

A great many breeders are not posted on the amount of injury to a community which can accrue from the use of an animal having a weakness that can be transmitted to the progeny. The quickest and most certain way to eliminate all unsoundness is for those who produce pure bred animals to consider these questions seriously. If every pure bred female was bred to a sound sire without any transmissible weaknesses, a move in the right direction would be started. There are plenty of outstanding individuals that are sound and of strong conformation, within the reach of every one owning a valuable female. A little care and attention in the selection of herd headers will do more for the up-building of sound breeding stock in this country than all the stallion inspection laws combined. All important questions must be solved by starting at the real foundation of the difficulty. A great many breeders have used stallions not up to the standard, on their females, because they have not given this particular subject enough thought. The object in a campaign of this kind is to eliminate most of the chances of producing an inferior sire that might perpetuate his inferiority and thus do great damage. It is only reasonable to expect that nearly every female, regardless of conformation, will be bred somewhere to some kind of a sire during this period of scarcity and good prices. If only sound sires are used on pure bred females for a generation or two, there will be little use for any regulations concerning unsound horses. Within the next quarter of a century a grade or a mongrel will meet with little demand. Practically all sires will be of a good conformation and registered in recognized stud books. This should cause every breeder who owns a pure bred female to think seriously about the selection of the sire before she is mated.

LOSSES FROM LACK OF HOUSING.

A great contrast in weather conditions has been experienced during the past two winters. Live stock generally has been in good condition this past season. The extreme winter weather of 1911-12 caused many to arrange for better conditions, and an abundance of roughness was prepared.

One can never foretell the nature of seasons and the safest plan is to provide early for suitable shelter. It is not only the humane thing to do, but it pays. A man that would rebel at burning seventy-five cent corn to add to his own comfort does not hesitate to feed the same to stock that it may supply in them body heat. Body heat must be maintained in some manner and if shelter and protection is not provided the animal must draw from the food consumed.

There is a whole lot of indifference manifested by people in this matter of comfortable shelter for live stock. Too often the south side of a wire fence affords the only protection for cattle or a few boards arranged to protect from the summer sun provides a draught of winter air for swine.

To provide warm, comfortable quarters for stock need be no expensive problem. While commodious barns are to be desired, yet a suitable protection may be made with very little outlay. The roof of a building erected chiefly for shelter is one of the most expensive parts of the structure. With a good grade of tarred or felt roofing one can make a rain and snow proof roof that will last for years. Inasmuch as it is light it does not need any great strength of frame to support it. The frame may be covered with boards of rather inferior grade provided they are of uniform thickness and inasmuch as the roof may be built quite flat, no lumber is wasted for the sake of securing a proper pitch, which is important when shingles are used. If such sheds are constructed with as few posts as possible for center supports it adds considerable to the convenience of access to all parts of the interior with team and wagon, which is appreciated in feeding, bedding and hauling away manure. If such a shed is constructed sufficiently roomy and with doors that may be closed through bad storms the entire herd may be shut in during such a period where they will pass through the storm unchecked in growth or gain.

Besides this, their feed will be dry and palatable and the manure will not be exposed to the elements to be leached away and perhaps lose its most valuable portion by being carried by rains or melting snow down some creek. We do not believe that farmers and even those that keep numbers of stock realize the waste that yearly takes place from not saving and spreading the manure made by the stock upon the land that is to produce crops. We feel sure that the agriculturist does not fully appreciate how rapidly he is depleting his soil of its native fertility and that unless he begins a system of renewing that fertility that he can expect an exhaustion of the soil to that point where agriculture will be no longer profitable such as has already taken place in several of our earliest settled states. There is no cheaper way of returning to the soil the fertility lost in grain farming than by husbanding the manure produced by the live stock of the place. When stock is forced to gather its sustenance from the fields during periods of inclement weather it finds its food in a stale and unpalatable condition and as spring opens up the harm done to the ground by tramping and puddling it is almost beyond computing. Past seasons have developed a condition causing many to try the silo for the first time, and the enthusiasm and good reports from such experience has been very gratifying. The signs of the times point to their more general use. It means that a larger acreage of corn ground may be cleared for fall preparation. In this way ground in localities where fall plowing is of great benefit, may be prepared and the load of spring work proportionately lightened. Let us have good stock, better sheltered, the manure returned to the land, better and more palatable feed and fields cleared early that they may be put into shape for a better crop the subsequent year, and not ruined by animals tramping through the early spring mire in quest of the poorest grade of food.

WRITING ARTICLES.

We wish to thank our readers for the many valuable articles that have been contributed to this paper. We wish to encourage them to write more of these. We like to have these subjects discussed by those in the field of activity. The American Breeder is in a position to carry on the greatest experiments in the world through its readers. The many new things which have been advocated in this paper have been tested, and we are glad to have our readers to state, in their own language, what results they have obtained. Some have made mistakes that have cost them money. We are glad to have those explain their mistakes, so that others will not make the same errors. It is not necessary that the article be long, in fact, we would rather have short articles, of from two hundred to five hundred words. Tell the story in just as few words as possible. Make the sentences short. We will correct the grammar and make it readable when requested. We wish every reader would take this as a special invitation to prepare a short article that will interest other breeders. Don't wait for someone else to write, do it now. We are going to have a lot of space the coming year for these statements. The American Breeder will be larger and have more room. Who will be first?

"APPEARANCE VALUE" OF GOOD STOCK.

Did you ever stop to consider the "appearance value" of a horse or mule? By appearance is meant a value in addition to the amount that the animal will bring in cold, hard cash or to its producing power. A Kansas City banker recently hold a story that illustrates the point. He said: "A few years ago a big Missouri farmer wanted to negotiate a considerable loan. I was young in the banking business, but my firm sent me to look over the collateral offered. I was to meet the man seeking the loan at the hotel in his home town. I got there before the appointed hour and awaited him. About half an hour after the appointed time a middle aged man in a ramshackle old buggy drawn by two of the worst looking crowbaits I ever saw arrived and introduced himself as the person I was looking for. He said he would show me the farms he sought to borrow on. We had to drive some seven or eight miles, and the sight of those disreputable horses, the clink of the chain tugs, spoiled those farms as an asset. I could not imagine a man who had such horses being worthy a loan, and I would not take the responsibility. I reported to my bank, "Assets do not justify the amount asked."

In other words, those plug horses ruined his credit, a thing that is of more value sometimes than actual cash.

No breeder, no farmer, or anyone who uses horses or mules in his business, can afford to do without the "appearance value" derived from good stock. It increases his credit, advertises his business and gives the owner the proper standing in his own community.

If you do not believe these facts, make your own observations and see how many exceptions you can find.

STALLION SERVICE RECORD BOOKS.

At our request many breeders have sent us their suggestion as to a service record book. We have taken the best of these suggestions and made a new record book that we believe is very complete. It contains two hundred pages for recording mares; twenty index pages arranged in alphabetical order so that all the mares belonging to one letter will be together and each mare will have her page number so that she will be easy to find. A specimen page of this record book can be found in an advertisement in this paper.

We have the record books which we have had heretofore. Thousands of breeders have been using them and know what they are. The old form has a blank note for the signature of the mare owner. It contains only room for one hundred mares. This book has given good satisfaction, but many breeders want a book with more pages in it, without a note attached. We can supply either on short notice. The price of these books is 50 cents each or six for $2.00. In ordering please state whether it is a new or an old one wanted.

JACK SERVICE FEE.

We never have known why it was that the average mare owner will object to paying a reasonable service fee for an extra good jack, but it is probably the fault of the owners of this stock. If the jack owners will see that the mules are sold for a fair market value, and get it thoroughly advertised that there is a difference in jacks, the service fee problem will solve itself. Good jacks are very profitable when properly handled.

There is another method by which good jacks can be made money makers very easily, that is by the use of the capsule system. This is really a benefit to every one concerned, as the jack will not be crowded severely and not be injured. Several mares may be bred at each service and make plenty of money for his owner. This is a matter that should be studied closely by those owning good jacks.

WHAT PERCHERONS RECOGNIZED BY THE GOVERNMENT?

What associations for the registration of Percheron horses are recognized and approved by the United States government? And are there any associations not recognized by the national law and yet recognized by some state? If there is such an association give name of it? Are the horses registered in it considered pure bred? Are the horses registered in an association that is not recognized by state or national law pure bred?—South Dakota Subscriber.

The only Percheron horses recognized by the Bureau of Animal Industry are those registered in the Percheron Stud Book of France and imported to this country. January 1, 1911, the government withdrew its recognition of all American recording associations. The Percheron Society of America with headquarters in Chicago and the American Percheron Breeders' Association with headquarters at Plainfield, Ohio, were recognized by the government up to January 1, 1911. The Percheron Registry Company of Columbus, Ohio, was also recognized, but was taken over by the Percheron Society of America. There is no national law which supervises any American association.—Editor.

DAN, THE FIRE HORSE, DEAD AT 34 YEARS.

Kansas City's best known and most widely traveled horse died last week. This was Dan, the fire horse, with whose portrait older readers of the American Breeder are familiar. Dan and his mate, Joe, were taken to London in 1893 by the Kansas City Fire Department to be exhibited and used in the contests there under the auspices of the International Fire Congress. In the contests for quick hitch and run, Dan and Joe beat all other contestants and did one of the best jobs of European advertising for the United States, and Kansas City in particular, which was ever done. A year later Joe was killed in a collision with a cable car here in Kansas City. Dan stayed in the service until 1906, although he was used carefully toward the last. He was then retired as a pensioner and taken care of at Swope Park until his death. He lacked only a few months of being 34 years old.

GOOD NEWS OF AMERICAN ROYAL

The best news which has come from the American Royal Live Stock Show for some time was contained in the report of the last regular meeting. At the meeting of the new board of directors elected at this time, all past doubt as to where the next American Royal Show would be held was wiped out. The show will stay at the stock yards, and it is apparent from the list of new officers that the stock yards management will be in hearty sympathy with the show.

Thos. J. Wornall, who has been officially connected with the greatest growth the show has known, was chosen secretary and manager. The other officers are as follows: President, H. C. Duncan; vice-president, J. C. Ewing; treasurer, R. H. Hazlett; directors, N. H. Jentry, G. E. Clarke, C. E. Caldwell, W. H. Weeks, Geo. R. Collett, R. J. Kinzer. Mr. Collett is general manager of the Kansas City Stock Yards Co., and Mr. Weeks is his assistant and T. J. Wornall is on the stock yards board of directors. The office of the American Royal will continue as heretofore, in the Live Stock Exchange building, Mr. Wornall in charge.

ANNUAL SHORTHORN BULL SALE AT KANSAS CITY.

An annual sale of good, well fitted Shorthorn bulls, to be held at Kansas City, has been decided upon by the Central Shorthorn Breeders' Association as a feature of the annual meetings of this organization. In addition to the bull sale, a part of a day at least, will be given at each session to the discussion of subjects of interest to the members of the association and on the evening preceding, or the evening following, the sale, an annual banquet will be held. All this was decided upon at the meeting of the Central Shorthorn Breeders' Association which was held at the Live Stock Exchange in Kansas City last week. The meeting was one of the best held in several years, and was well attended, chiefly by breeders from Kansas and Missouri, some of whom were among the organizers of this association 14 or 15 years ago. The time of meeting will be fixed hereafter for some time in March, to make it more suitable for the sale. Officers elected for the ensuing year are as follows: James Tomson, Carbondale, Kas., president; N. H. Gentry, Sedalia, Mo., vice-president, and E. M. Hall, Carthage, Mo., secretary.

SHIRES AVERAGE $2,270.

To the American Breeder:—We are in receipt of a cablegram from our Mr. J. H. Truman advising us that at Lord Rothschild's sale held at Tring on the 14th, 32 Shire colts and fillies, running in ages from yearlings to three years old this spring, sold for an average of 545 guineas ($2,270) and the colt that was junior champion at London last year, Champion's Goalkeeper, topped the sale at 4,100 guineas. This is the world's record sale. —Trumans' Pioneer Stud Farm, McDonough Co., Ill.

AS THE NEW YORK HERALD INTERPRETS US.

With thousands of horses to be seen daily on the streets of New York, and with mules so uncommon here as to be almost a curiosity, few persons realize that something like a craze for mules is sweeping over the country. According to the editor of the American Breeder, which is authority on the mule raising industry, the United States now has more mules than can be found in all the rest of the world, and, what is more remarkable, about one-fourth of all the mares kept for breeding purposes in this country were last year mated with jackasses.

These figures will astonish the average horsemen, and, if they are anything like accurate, they should set all horsemen thinking about the ultimate effect of this craze for mule breeding on the horse stock of the country.

ILLINOIS LICENSED STALLIONS NUMBER 9,677.

The stallion registration board of the state of Illinois has just issued its third annual bulletin, listing by counties all the licensed stallions standing in that state at the time the copy for the bulletin was compiled. The licenses in force October 31, 1912, show the following numbers of pure bred stallions: Percheron, 2,711; French Draft, 277; Belgian, 357; Shire, 473; Clydesdale, 204; Suffold, 6; Standard, 1,203; Morgan, 74; Thoroughbred, 20; Hackney, 43; German Coach, 162; French Coach, 38; Saddle, 55; Cleveland Bay, 3; Shetland, 58. This makes a total of 5,688 pure bred stallions. The total number of grades standing is given as 3,984. There are five cross bred stallions licensed, making the grand total of 9,677 stallions licensed in the state.

"THERE NEVER WAS A TIME WHEN THE WORK OF THE BREEDER WAS SO MUCH NEEDED AS NOW."

Frank B. Graham, Editor American Breeder.

Dear Sir: I want to thank you most cordially for the splendid paper which you read before the Kansas Improved Stock Breeders' Association, and to say that the information that you gave was most highly valuable and thoroughly appreciated by the members.

I want to compliment you on the manner in which you usually wind up your addresses with a little moral lecture. Coming as it does in connection with matters which have their chief interest in money making, these little lectures have a weight which you, yourself, can not fully appreciate. They will do an enormous amount of good. I also wish to thank you for the notice of the meeting of this association which has appeared in the American Breeder.

There never was a time in the history of this country when the work of the breeder was so much needed as right now. The question of the meat supply as well as the motor supply of this country will affect breeders of cattle, hogs and horses alike. In the twenty-three years of its existence the Kansas Improved Stock Breeders' Association has been able to do a vast deal of good, but its most valuable work still lies ahead of it.

Conditions are such in this country that the farmers are at the critical point—they must either continue their present methods of grain farming and go down hill, or they must increase their live stock farming and win success. It will either be a crises or an epoch.

Very truly yours,

KANSAS IMPROVED STOCK BREEDERS' ASSOCIATION.

I. D. GRAHAM, Secretary.

The crusade against public betting on trotting and running races has done much, and the automobile has done much more, to deplete the supply of light horses in the last few years, but neither of these influences can hold a candle to the mule as a blight on the horse stock of the United States if the estimate of the Breeder is to be relied upon.

Every mare used for breeding mules is virtually the last of her line. She may produce a dozen or more mule foals, but there her family ends, since the long-eared hybrids do not reproduce. With good mule foals selling for $125 each at weaning time, the growth of the industry is little short of marvelous, and many of the choice draught mares as well as trotting bred mares and thoroughbred mares are being mated with jacks. So far as the effect on the future horse stock of the country is concerned these mares might as well have been exported to Africa. In either event, they would leave no descendants to perpetuate the breed in America. Even the mule breeders are beginning to show concern about the future supply of mares for their operations if the present tendency is not arrested.

Mark Morton, one of the officials of the American Hackney Horse Society and of the Percheron Society, and an extensive breeder of both carriage horses and draught horses, said to a reporter of the Herald at the National Horse Show of 1911, that he attributed the increasing scarcity of good horses in the markets of the country to the craze for breeding mules, which then was less pronounced than at present. Mr. Morton at that time predicted a veritable "horse famine" as the ultimate outcome of the short sighted course pursued by the breeders, and judging from the stories told by dealers who buy for the New York market, the time is close at hand when an adequate supply of good horses cannot be found.—New York Herlad.

NATIONAL FEEDERS AND BREEDERS' SHOW.

The next great American show of live stock will be the National Feeders and Breeders' show to be held at Ft. Worth, Tex., March 8 to 15. The show will be housed in the Coliseum building at Ft. Worth, built for that purpose, and the premium list provides for complete classification of breeding stock and horses, cattle, hogs and sheep. In addition there is a classification for mules and much more elaborate ones for fat cattle and fat hogs, both single animals and car lots.

This will be the 17th annual exhibit conducted by this association. The secretary and manager is John H. Stofford, Ft. Worth, Tex. In the division for horses, all light harness and saddle animals will be shown at night and the Ft. Worth horse show has become a society event as well as a high class exhibition.

PARTIALLY PERSONAL

The fine publishing plant of James M. Pierce, Des Moines, Ia., was burned early this month. Mr. Pierce issued three big farm weeklies, besides doing much outside publishing, and the fire was one of the most serious that has occurred in the farm paper field.

The choosing of good practical men (mature in judgment and schooled in accurate and scientific knowledge) for county farm advisers, is one of the most commendable of the many commendable things the various state agricultural colleges are doing.

Keep the weeds down; have a place for everything. Then you will have more time to live. Persons will travel miles to see your home. You will be a better citizen and more useful to the community—Kansas Industrialist.

In Missouri's recent corn show at Columbia, first prize for acre yield was won by L. F. Cottey, Edina; second prize, Chris Smith, Bunceton. The first prize acre yielded 100 bushels and five pounds. This yield was larger by over two bushels than the best yield from bottom land.

The "Old Dutch Cleanser" people—the Cudahys—are "chasing the dirt" out of Meade County, Kas. This particular batch of dirt they are after is said to be a silica mine between Meade, Kas., and Fowler, Kas. The Cudahys use silica for its scouring properties in making their "Old Dutch Cleanser."

Jack Harrison, one of Missouri's best known breeders and stockmen, has lately disposed of the old Harrison ranch of 982 acres, near Aux Vasse, on a basis of $100 per acre. He gets $50,000 cash and a 415-acre Ralls County farm. Bell Bros., of Rochester, Ill., get the Harrison place.

The value of Missouri farm products and live stock for the past year is estimated at more than three-quarters of a billion dollars. Of this stupendous sum almost $200,000,000 is represented in the ordinary field crops alone, according to W. L. Nelson, assistant secretary of the Missouri State Board of Agriculture.

A live stock classification for county fairs has been prepared by E. A. Trowbridge, animal husbandryman of the Missouri Agricultural College, Columbia, Mo., and can be had for the asking. This is a good thing. Some premium list classifications remind one of the waitress who asks whether you will have grape fruit or griddle cakes.

When a public sale of fine stock is disappointing, some of the papers that advertised it include in their reports the statement that "some of the better lots might have brought more money," a sort of non-committal sop for the sellers who were not satisfied with the way things went.

Now it is announced that the Implement Dealers' Association is going to join the bankers, grain dealers and railroads in teaching the farmer how better to farm. What the farmer needs is more hired men, with brains enough to differentiate between a buck rake and a billy goat, and industry enough to keep themselves warm working when the thermometer stands at 40. The bankers and railroad magnates haven't helped much in this line, but the implement men ought to do better.

Congress has given us law to keep out diseased and insect infested plants—United States Department of Agriculture Report.

Experiences of Practical Men With Modern Breeding Methods

To the American Breeder: I would like for some of our brother breeders to tell me where and how I can get onto the capsule system of breeding. Please give me full instructions; also where I can get the capsules and whatever it takes to make it a success.—Missouri Subscriber.

On this page we are printing communications from a few of the hundreds who doubtless will gladly give the gentleman the information he desires, and "show" him if necessary.—Editor.

To the American Breeder:—I have used capsules for about six years and have had fine success. I have found that I can get mares with foal with capsule when I cannot any other way. I bred five mares with one cover to my jack and four of the mares are heavy with foal. I also bred jennets with the capsule, and had good success. I also used the Carlson Semen Extractor the last year. I will use the capsule this year also.—Alex Brown, West Mineral, Kas.

To the American Breeder:—You want all the information from beginners who have been using the capsule and impregnator system. Now I am not a graduate from your school, but would be if I could have gotten there, but I expect to be in the near future, for I think the Scientific Breeding method is a marvelous thing to the horse business. Every man that owns a stallion or jack cannot afford to be without the system. I ordered a box of capsules and an impregnator last spring and without any experience, I settled three mares out of five that have never before raised colts and had been bred every season from three to seven times and some mares had missed colts from two to seven years. I settled those with good results.—W. A. Schwenck, Bushnell, Neb.

To the American Breeder:—I have used the capsule system on only a few mares, but got two imported mares in foal with it that just would not settle any other way for two years. I was very much satisfied. In fact, I did not intend to use it very extensively when I got it.—W. J. Butler, Ottawa, Ill.

To the American Breeder:—I used the capsule system with about the same results as the horse or natural service. I got some mares that were given up with the natural service, but again I missed some both ways. Last year was a hard one here, as we did not have feed, but think will have better success since I attended the Breeding school.—Leon LeClaire, Willow Lake, S. Dak.

To the American Breeder:—I have been in the breeding business about 18 years. I now use the capsule system and can save my customers lots of time coming back. I can accommodate all that come and save my stock and get a much larger percent of foals. It not only helps me, but gets more colts for my customers. I have settled a great many mares that I could not settle with the horse. I have no trouble with my customers, they come and call for the capsule.—G. W. Nickerson, Bethany, Mo.

To the American Breeder:—I have been using the capsule system of breeding for the past two years with splendid success.—C. L. Gay, Rockport, Ill.

To the American Breeder:—The capsule breeding is a new thing in my locality. That being the case, I have bred only a few mares, and they were mares that could not be foaled otherwise. I foaled all these to my jack except one. After the season I foaled her with my horse. I expect to do a good business this year with the capsules.—Herbert Parsons, Oto, Mo.

To the American Breeder:—Three of the prizes in our colt show were won by capsule colts. Farmers are convinced that "it can be done" and in some cases to advantage rather than the use of the stallion with some mares. They are now inquring about the "new way" around here.—R. R. Pittis, Scio, Ohio.

To the American Breeder:—I have used your capsule system for two years and have had good success. I have gotten two colts with one cover several times. I would not do without one if they cost twice the price. It is better for the horse. Some mares will take the horse the whole season. I use the capsule on her and if that does not get her in foal she is void. It is sure and safe.—E. E. Brennen, Filer, Idaho, R. No. 2.

To the American Breeder:—I have used the capsule system one season with entire satisfaction. I can truthfully say that the capsule method of breeding is far in advance of any other way of breeding.—J. F. Sperry, Huerfano, Colo.

To the American Breeder:—I can say I have been in the stallion and jack business for 15 years, have handled three stallions and one jack two seasons and before I used the capsule system I missed one-third of the mares bred. Now I breed all healthy mares to the horse (natural service) and all bad ones are cleaned up and bred with capsules. I get 75 percent of mares in foal this way. I consider my semen extractor, syringe and capsules make me $200.00 a year and would advise every stallion and jack owner to get an outfit. Any man that is clean and particular can use them.—Emil Hosler, Mt. Pleasant, Utah.

To the American Breeder:—In regard to the breeding with the capsule system, I must say I have bred nine mares in 1912, of which there are four in foal, which is not bad for a beginner. They were bred only once. If the mare owners would be willing to come to the place where the horse has his stand, it would be the only way to breed.—Emil J. Lorenz, Jamestown, N. D.

To the American Breeder:—I have used the capsule system some and have found it to be very satisfactory. One of my friends bred a mare and took her home, some three miles, and extracted the semen from her and bred another one and both got in foal. —B. D. Wilcox, Preston, Idaho.

To the American Breeder:—Last season I had good luck with the capsule breeding system. I settled mares with one capsule that had been bred the two previous seasons by natural service and failed to get in foal. I would not do a breeding business without using this system of breeding.—Orville Mills, Cedarvale, Kas.

To the American Breeder:—I have used the capsule system for two seasons and have had fair success with it. I have been able to get some mares in foal with the capsule that I was not able to get any other way. I have never been fixed up in the right way to use them properly.—A. B. Tyler, Draper, S. D.

To the American Breeder:—I have used the capsule system of impregnation and consider it a success.—T. C. McGiboney, Kimble, Mo.

To the American Breeder:—I used the capsule system last year with good success and think it all right if handled right.—I. H. Tohill, Hutsonville, Ill.

To the American Breeder:—I have tried artificial breeding with extractor and capsules, after taking a course at Graham's Scientific School, and find it a more satisfactory way than the old way. I would advise every stallion and jack owner to attend the school and follow its teachings. It will mean success to do it.—H. C. Jackson, Dimmitt, Tex.

To the American Breeder:—I cannot do without your paper for it tells all about horse raising and breeding. It is worth twice the money it costs and if every stallion owner would follow the instructions they would get a much greater percent of foals. I used the capsule system last season and had good results.—Theodore Tanner, Stone Fort, Ill.

To the American Breeder: I have been using the capsule system for three years and can publicly say they are all right. Have settled lots of mares, and I am satisfied I have settled lots of mares that could not have been settled any other way. I bought one of the top jennets sold last spring and I think the owner had been breeding her for a year or two. I got her the first shot with a capsule. She will foal in April.—T. E. Collins & Son, Belleville, Kas.

To the American Breeder: I had fine success with the capsule system and advise all breeders to attend the breeding school. There are more things to learn than the capsule system that have been a great help to me.—Ray Colgrove, Girard, Kas.

To the American Breeder: In regard to the capsule system, I used it on nine mares of my own and got the nine in foal with it. I also used it on a few of the customers' mares and as near as I can find out, a good per cent of them are in foal. I think the capsule system is going to be a success and expect to continue using it on my own mares and on my customers' mares that are willing for me to use the work.—I. C. Evans, Troy, Ia.

To the American Breeder: In regard to capsule breeding; if properly handled in every way it is a grand success, but if handled in a haphazard way it is a failure. I had fair results with capsules last season, but believe I am in a better position to get good results next season than in the past. I think the best resuls I had last season, I bred four mares at one service and got them all in foal.—T. J. Cunningham, Cartmell, Mo.

To the American Breeder: Have used the capsule system the past season and like it fine. I have settled mares that had been bred the naural way for several years and did not settle. One had been bred four years and did not settle; settled her the first year with capsule.—H. C. Wornom, Mayfield, Kas.

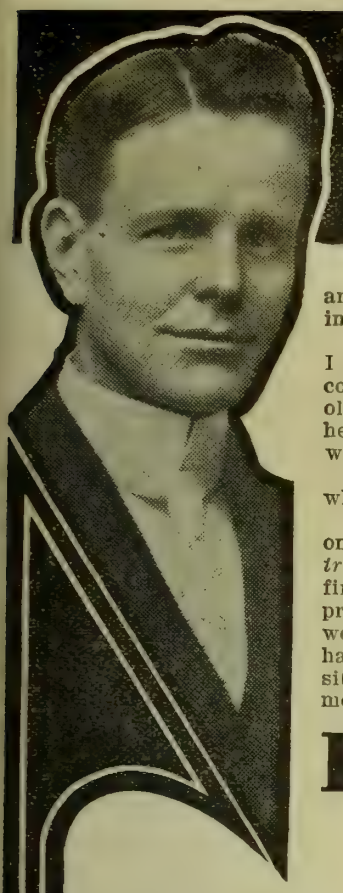
To the American Breeder: Will say that we have good success with capsule breeding; would not think of depending on the old method of breeding, and not use the capsule. No man can afford to be in the dark and he who does not use the capsule system is in the dark.—J. H. McKinney, Eudora, Kas.

To the American Breeder: In regard to experience with capsule system in breeding, I have used capsules two seasons and consider them as sure as natural service, and on barren mares much more so, if they are used by a man who knows the antiseptic rules.—F. W. Roach, Anthony, Kas.

To the American Breeder: We tried the capsule system on thirty mares last spring and all seem to be with foal. As it was a new venture in this neighborhood no one seemed to have faith in it, but this season will quiet their fears, and we will use it more extensively in the future. We had a larger trade than we could handle with our stallion and decided the only way out was to breed with the capsule, and it solved the problem to our and the public's entire satisfaction. The time is coming when the mare owners will insist on the capsule method rather than breed to a scrub stallion or jack.—Miller Bros., Atlantic, Iowa.

To the American Breeder: As I bought a capsule outfit last spring, I will say that I have had very good results. I am not sorry that I bought it. I think no horse breeder should be without one.—J. S. Gieselman, Morris, Minn.

To the American Breeder: The little that I have used the capsule system is satisfactory. I consider a wise breeder would not do without it; it saves the horse, gets better and stronger colts and more of them and is a money maker. With its help I got 85 per cent of foals last year.—H. C. Tillotson, Latham, Kas.



To the American Breeder: I will say I did not get to try the capsule system much; I bred eight in all, old mares that had been no good, and got five in foal. I think the system is the right thing.—James Sabin, Soldiers Grove, Wis.

To the American Breeder: I have had two years' experience with the capsule system and have this to say that in coming years it is the only method that should be used.—Wm. J. Steinbach, New Rockford, N. D.

To the American Breeder: I have used the capsule system for two seasons and have met with good success, having foaled both mares and jennets when every method had failed for several years. Do not use it much except on barren animals.—B. C. Hunter, Farmington, Tenn.

To the American Breeder: Will say the capsule breeding is a success if properly used. My luck has been in being careful of temperature and cleanliness and the exclusion of the sun's rays—three essentials that must be observed. I wouldn't be in the business without this system.—R. W. Davis, Wolbach, Neb.

To the American Breeder: I used the capsule some last season; had reasonably good luck for what I used.

I WILL TEACH YOU HOW—SECURE YOU A POSITION—YOU PAY WHILE YOU EARN

My business is to assist you to make money—more money than you are now making. To assist you to a position of trust and confidence in the business world. To fortify you with a business training so complete, and so thorough that it puts you in the position of the "sought," instead of the seeker. To take you by the hand and lift you out of the rut.

I have assisted hundreds of ambitious young men and women of the farm to high salaried positions of trust and influence. I have hundreds of letters from graduates who are today earning more money—and earning it with more ease—than the average country doctor, lawyer, banker or merchant. These young men and women, like yourself, were once plodding along in the same old rut—wishing and hoping for a chance to realize their ambition to become successful workers in the business world. They heeded the Ransomerian knock of opportunity—and today, as Ransomerian graduates, have either reached, or are well on the way to the goal of their ambition.

Away down in your heart you know you have an ambition to progress—to get down to brass tacks with yourself and get somewhere—and you can, if you will.

You may want to become a stenographer; bookkeeper, expert penman, enter civil service. Or you may have decided to stay on the farm—but no matter what your ambition may be, a thorough business *training is absolutely necessary.* Realize that ambition—start now—take your first step—clip the coupon at the bottom of this page. It will bring you a special proposition—a brand new feature. I have arranged for the young men and young women readers of the American Breeder—a proposition so good no other school has ever felt able or competent to offer you. I want you to get this special proposition. I want you to learn at first hand just what this is, and just what it means to you.

C. W. Ransom

BE SQUARE WITH YOURSELF—LOOK TO YOUR FUTURE NOW

The business world is crying out for competent, well trained young men and women to fill good paying positions of trust and confidence. The United States Government, Railroads, Corporations, Law Firms, Manufacturers, Wholesalers, Retailers—all are clamoring day and night for sturdy bodied, clean-minded assistants in their mad rush for the Almighty Dollar. But the demand is that you *must be prepared.* This does not mean that you must have had previous experience—but it *does* mean that you *must* have a thorough business training in a specialized business training school; that you *must* have the stamp of approval and unqualified recommendation from a recognized business trainer—from a school with the reputation of producing competent, successful workers—a school such as the Ransomerian School is.

In this constant demand for trained assistantants, preference is given the young men and women from the farm. Why? I'll tell you! It is not that they are any better than their city bred friends, but simply because of the fact—and experience has proven it—that the young folks of the farm early learned the value of exactness, promptness and time—three patent essentials absolutely necessary in a well organized business office. Look around you! You can count among your friends a boy here and a girl there, who are making good in the business world; friends who are no brighter than you—who were possessed of no better education than you—but who, by their heeding the persistent knocking of opportunity—and having embraced it—applied themselves, are now well on their way toward the top of the ladder. This is dyed in the wool truth, friend, and you know it!

You are as ambitious as they; you are just as bright; just as capable; just as persistent. There is a position ready for you—and just as good, or perhaps even better than theirs—when you are ready for it.

Then why delay longer? Why allow your ambition to be smothered for lack of will power? Why not give way to that everlasting, burning ambition to do something worth while, to get somewhere in the business world? Then write me fully and frankly and tell me your hopes, and ambitions, and let me send you my special proposition and literature containing a simple matter-of-fact statement of my school and my methods.

PERSONAL

I spent 18 years of my life on a farm—and a Kansas farm at that, and I can look at this matter just as you do. I know the confidential talks you have had with yourself of what you want to do in the business world. I know the thoughts that flit through your brain day after day as you drudge along following the plow, round after round. I know what it is friend, for I have been there myself. I remember full well, one cold dark December morning, while out harnessing my team by the light of an old smoky lantern, that my emancipation came. I remember it as though it were but yesterday. I said to myself something like this: "Ransom, there's work for you to do out in that great big business world somewhere, when you are ready for it; work you can do; work you will enjoy; work for which you will be well paid. Prepare yourself for it; start now." And I did. Before I took that team out to the field, I returned to the house and answered the advertisement of a business expert. That decision, made while harnessing the old bays, decided my future, and today I can claim the credit, and enjoy the distinction, of having assisted hundreds of young men and young women of the farm to well paying positions of trust and confidence, in nearly every state in the Union, and many foreign countries.

Here is Your Chance—And Now

I WILL TEACH YOU HOW—SECURE YOU A POSITION—YOU PAY AS YOU EARN!! Stop right here and now—let this soak in. I mean just exactly what the sentence implies. I mean that I can fit you to realize the ambition you have so long harbored to become a successful worker in the business world. I mean I will not only fit you for that position—but assist you to secure it when you are competent to accept it. I mean you can pay me for one-half of your business training after I have fitted you for a position—and you are drawing a regular salary. I will make the balance of the payments to suit your convenience; and I will also assist you to a place to work outside of school hours, that will pay your room and board while in school. You could not ask for a fairer proposition than that, could you? Of course you couldn't. But get the full details. Write for my special proposition. It goes into every detail fully and accurately. Use the coupon, a postal, or letter. Simply indicate what branch you are especially interested in. Do not hesitate or delay. The sooner you act, the sooner you will be a Ransomerian Graduate—and a Ransomerian Graduate is a successful, trained business worker. This is your opportunity to realize your ambition. Embrace it.

And These Branches the Stepping Stones

Pennmanship.	Stenography.	Commercial Arithmetic.
Auditing.	Accounting.	Business Practice.
Bookkeeping.	Banking.	Commercial Law.
Civil Service Training.		Rapid Calculation.

Any single one of these branches is a stepping stone to better positions. You may have a preference—you may want your business training to embrace one or all of them. But no matter your preference or disposition—one, or all—means expertness with me. Look to where these branches lead. Penmanship to professorship; Stenography to Private Secretaryship; Audiiting to Management; Accounting to the independent business of Public Accounting; Civil Service training to Government positions, etc. Here they are—all of them—ready and waiting for you to choose. One is equally good as another—it's simply a matter of preference.

WRITE ME NOW—PERSONALLY!

You cannot be impressed too strongly with the fact that Expert Business Training is absolutely necessary to your future success, no matter what line of endeavor you desire to follow. Therefore, start right—prepare yourself in a school that has proven its merits—from which a diploma means something.

Opportunity will not always be yours. Embrace it now while you have the chance. Take advantage of this special proposition I have arranged for you. The sooner I tell you about it, the sooner you will realize your ambition. You KNOW you want to be a successful business expert—I can make you that.

Stallion Service Record Book for Two Hundred Mares.—The latest and best on the market, as cheap as the cheapest. It is a handy pocket size with waterproof cover, printed on the best paper. It has a calendar, a gestation table and an index of twenty pages so that each mare can be found easily. Each mare has an entire page. This book can be used for several sires without carrying more than one at a time. Notice how easily it is to record the breeding of a mare and give the details. This record book is the result of the opinions of many breeders. It has no worthless advertisements in it. If you are not satisfied with it, return it and get your money, which will be cheerfully and promptly refunded to you. Price 50c, or six books for $2.00. Postage prepaid. Published by

THE AMERICAN BREEDER

225 WEST 12TH STREET

KANSAS CITY :-: :-: :-: MISSOURI

Can tell more about it when colts begin to come. I think I bred over five hundred mares in 1912.—J. G. Tyler, Edmond, Okla.

To the American Breeder: I will say I have had fine success with the capsule breeding; think it the only way on mares that are hard to get in foal. Would not stand horses without the use of them.—S. C. Marshall, Overbrook, Kas.

To the American Breeder: I have used the capsule system for two seasons and would not do without it. My success has been very satisfactory to me and my patrons. I have settled mares which never did breed and the colts are as good as any in the county. Farmers are taking more kindly to the new system as they study it and get better posted on breeding times.—J. S. Smith, Callaway, Neb.

To the American Breeder: Will say that I have used the capsule system for two seasons, and am much pleased with the results. The first season the percentage was better than by natural service and this year the per cent will be at least 15 per cent better than last. The colts are just as good as by natural. Our patrons are pleased because there are no disappointments in getting a service. Would quit the business before going back to the old way.—Joe V. Painter, Middletown, Ind.

To the American Breeder: As to the capsule system taught by F. B. Graham, after three years of trial, will say it is the only way.—Wm. L. Parr, Ruskin, Neb.

To the American Breeder: I have excellent success with the capsule system. It will pay any man with stallion and jack stock to learn and use the capsule system. Please send sample copy of the American Breeder to Hunt & Long, Huntsdale, Mo., R. 1. They are just starting in the stallion and jack business. I say it is the best paper of the kind in the world.—O. W. Layson, Hatton, Mo.

ANOTHER WHO THINKS THE BREEDER SHOULD BE LICENSED.

To the American Breeder: Your letter of January 29th received. Would have answered sooner but was away at the time it came and returned last night. I have been using the capsule system for three seasons. I wouldn't think of standing a stallion or jack without being a graduate of the Breeding School, and I don't think any man ought to be allowed to stand stallions for public service without he was capable of detecting and treating diseased mares, and testing the semen of the stallion. I think a law to make the stallioner pass an examination, with certain qualifications to procure a license to stand a stallion, would be of much more value to the breeding public than a law to license the stallion like we have in several of our neighboring states and I am sure the percent of foals raised each year would be 40 per cent greater. At least it made that difference with me and I had been in the business for 25 years.—C. A. Kilkeny, Clark County, Mo.

A new breeding establishment devoted largely to Percheron horses, is to be established on the F. I. Burt ranch in Hodgeman County, Kas., which has been traded to Ed H. Rife, a rancher of Rock Springs, Wyo. The ranch contains 1,840 acres of the best watered land in Hodgeman County and is one of the largest ranches in that section today. The consideration was $52,000, a 50-room hotel in Eureka Springs, Ark., being taken as part payment. Mr. Rife will bring to the ranch some fine Percherons from his big ranch in Wyoming.

Mule Trade Shifts to Country

Buyers Took 1700 Direct From One County—Price of Beeves Turns Upward Again—Feeder Cattle Highest on Record—Hogs Up on Reduced Receipts.

Thus far this year Calloway County, Missouri, feeders have sold close to 1,700 head of mules direct to buyers who ship South and Southeast for final distribution. Other sections in Kansas, Missouri and Iowa have sold direct to buyers whose final distributing points were in the East, South and West. It would be hard to estimate this total volume of business, but its most important feature is that buyers have dealt with feeders, reducing freight, commission and handling expenses to a noticeable degree. The fact that a community that prepares good horses and mules for the professional buyer insures itself a home market is worthy of consideration, and is somewhat new to the central West.

This season has been unusual throughout. Last fall the abundance of feed made countrymen buy an unusual number of horses and mules for fattening this winter, and the urgent demand early this year sent buyers direct to feed lots to get their supplies. This condition may prove only temporary, but horse feeders are of the opinion that this new system of buying promises fairly to be permanent. Much, however, depends on whether countrymen continue winter feeding.

In the past two weeks buying direct from the countrymen has affected the commission dealings at central markets, in that volume of business was reduced, and demand became less urgent. In some cases prices were quoted down $5 to $10 a head, but in the past two days the loss was recovered. At markets in the Central West the most important demand is for farm mares. Seeding and farm work time is at hand, and farmers want the class that can be turned to work, and producing at the same time. Eastern trade is rather slack, though comparatively few strictly choice drafters have been offered. Medium Southern grades are in fair request, and the cheapest classes have sold fairly well. While the general trade has had some dull periods, it must be taken into account that the volume of business in the six weeks this year has been in excess of any previous similar period in the past ten years. Dealers say that requirements in the next two months will be large. Actual farm demand has not developed full force; Eastern trade can expand considerably; the South is still buying; and construction work will be a steady outlet source.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$$230@275
Drafters, fair to good	140@225
Chunks, fair to choice	130@165
Chunks, fair to good	85@120
Expressers and light draft	50@110
Plain workers	40@ 85
Southerns, good	125@145
Southerns, plain to fair	65@125
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 85@135
14 to 15½ hands	125@165
15½ to 16 hands	160@200
16 to 16½ hands	190@285

Rebound in Cattle Prices.

Two weeks ago cattle prices were at about the lowest level of the season, the closing days in February having seen a slight advance over the lowest point. The first two weeks this month has marked a steady advance, and prices now are 50 to 75 cents above the closing January level. The beginning of the Lenten season on February 5, did not make any curtail-

ment in demand, on the contrary killers have been so busy in January reducing prices at the expense of supplies that the beginning of an important fast season saw them eager for the offerings. Light receipts has been one cause of advancing prices. While total supplies of cattle at Western markets showed only a moderate decrease, the larger numbers sent back to the country, and reshipping to other markets left comparatively few for killing purposes. There is no doubt in the mind of the trade but that the low point of the season has been passed, and while February has already exceeded precedent by showing a substantial advance, March and April prices still have the prospect for a better showing. Hay fed cattle from Colorado, and meal fed steers from below the quarantine line, together with light receipts from the corn belt, are the principal sources of supply for the next two months. That part that remains in feed lots is in strong hands and will be marketed wisely, and with country buyers crowding killers for the lighter weight class a substantial rise may occur early in March. In the past week the top price for steers in Kansas City was $8.65, and in Chicago $9.25. Other markets reported sales up to $8.60, but the bulk of the steers at all markets were on a $7.50 to $8.25 basis. The meal fed classes are bringing $7 to $7.85.

Quotations from the various grades of killing steers are as follows:

Prime corn fat steers	$8.65@9.00
Good to choice steers	8.00@8.60
Fair to good steers	7.50@8.00
Common to fair steers	6.25@7.40
Meal fed, choice	7.50@7.95
Meal fed, common to fair	6.50@7.45

Moderate Advance for Butcher Stuff.

A less noticeable advance occurred in prices for butcher cattle than for fat steers in the past week, but at the low time two weeks ago butcher cattle were relatively higher than steers. In a general way prices are up 20 to 35 cents, and quotations show a comparatively narrow spread as choice stuff is very scarce. Killers' requirements are larger, and orders are not fully filled at any time. As the weather grows warmer demand for light cuts of beef will increase, and tidy weight heifers will be scarce. Most of the cows are selling at $5.50 to $6.50, entire range $4 to $7.50, and heifers $4.50 to $8. Veal calves are selling up to $10, but a drop in prices is forecasted for the next two weeks, as calves from the dairy districts will be fairly plentiful by that time.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.75@7.50
Fair to good	5.50@6.70
Common to fair	4.50@5.50
Canners	4.00@4.45
Heifers—	
Choice fed	$7.75@8.00
Good to choice	7.00@7.70
Plain to fair	6.00@7.00
Common	5.00@6.00
Veal calves	5.00@10.00
Bulls	4.25@6.50

Red Hot Feeder Market.

The bulk of the stock and feeding steers are bringing $7 to $7.50, half fat feeders up to $8.10, and thin feeders with good quality up to $7.75. Prices are the highest ever known, and to one who has not kept pace with the rise in prices in the past twelve months, present quotations are astonishing. One thing quite noticeable is that the daily supplies are being absorbed readily and there has been no congestion in the feeder trade in several months past. Breeding cattle, though exceedingly scarce, are being watched for with unusual activity, and the bulk of the light heifers that usually go to killers at this season are being turned back

The following quotations are for stock and feeding cattle:

Selected feeders	$7.65@8.15
Good to choice feeders	7.35@7.60
Plain to fair feeders	6.75@7.30
Selected stockers	7.35@7.65
Good to choice stockers	7.00@7.30
Plain to fair stockers	6.50@7.00
Stock calves	6.00@7.65
Stock cows	4.50@5.50
Stock heifers	4.75@6.50
Milch cows	35.00@90.00

Cut Down Upkeep

By R. E. Olds, Designer

I have built cars for 26 years—60,000 of them.

But of all I have learned, nothing else compares with these ways for cutting upkeep—shown in Reo the Fifth.

The Final Cost

The buyer sees just the car's first price. But the vital thing is the after cost.

That may be little or it may be much. It depends on the builder largely. And the difference to you, in the course of five years, may be $1,000.

How I Reduce It

One big item is tires.

In Reo the Fifth I cut this cost by using tires 34x4. They cost $60 per set more than tires often used on a car of this weight. But they save many times that in tire bills.

I use in this car 15 roller bearings —11 Timken, 4 Hyatt. They cost five times as much as common ball bearings. But they do not break.

I use 190 drop forgings, at twice the cost of steel castings. But drop forgings don't have flaws.

Margin of Safety

Axles and driving parts should show very large over-capacity. I build them all to stand the tests for a 45 h. p. car. That leaves enormous margin.

I have all steel made to formula. Then I analyze each lot twice.

For testing my gears I use a crushing machine of 50 tons' capacity.

I use 7-leaf springs, two inches wide. And I test them for 100,000 vibrations.

Each engine is tested for 48 hours —20 hours on blocks, 28 hours in the chassis. I employ unusual tests.

Each car in the making gets over 1,000 separate tests and inspections.

Costly Items

I use a $75 magneto to save ignition troubles. I double-base my carburetor, for low-grade gasoline. I use a centrifugal pump, not a syphon. That adds about $10.

I use 14-inch brake drums.

I give each body 17 coats, so the finish will endure. I use the best genuine leather in upholstering. Also the best curled hair.

I am using flush electric dash lights in place of the old-style lamps.

All these things are costly. Yet I supply them, through factory economy, in a wonderfully low-priced car.

A car without them is likely to cost five times as much for upkeep. There may be costly repairs, and frequent.

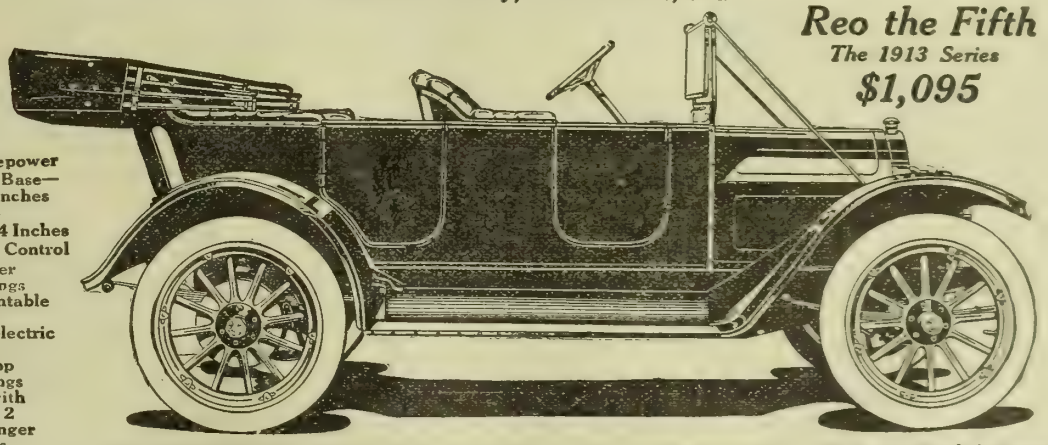
I never would buy a lesser car. Therefore, I never shall build one.

Our $100 Control

Here is one feature worth $100 which costs not an extra penny.

It's the Reo center control. All the gear shifting is done by moving one little handle only three inches in each of four directions. It is as simple as moving the spark lever.

The driver sits on the left hand side, as in the latest high-priced cars. And this control lever is at his right hand.



Both brakes are operated by foot pedals. There are no brake levers, so both front doors are clear.

A car in these days should have these modern features.

Sold by 1,000 dealers. Write for our 1913 catalog and we'll tell you the nearest show-room.

Reo the Fifth
The 1913 Series
$1,095

30-35 Horsepower
Wheel Base—112 Inches
Tires—34 x 4 Inches
Center Control
15 Roller Bearings
Demountable Rims
Three electric lights
190 Drop Forgings
Made with 5 and 2 Passenger Bodies

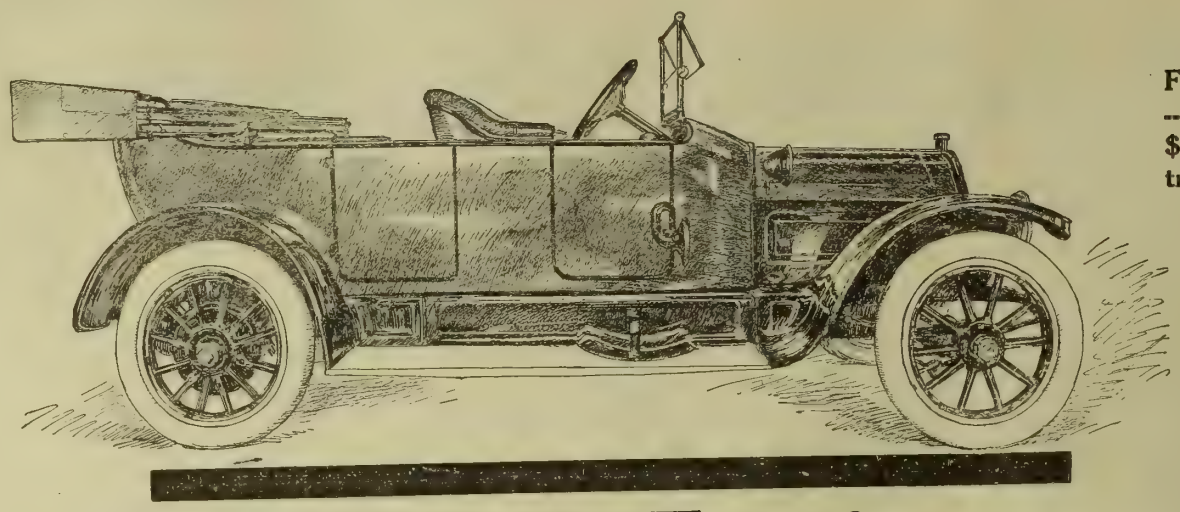
Top and windshield not included in price. We equip this car with mohair top, side curtains and slip cover, windshield, gas tank for headlights, speedometer, self-starter, extra rim and brackets—all for $100 extra (list price $170).

Big Rise in Hog Prices.

In the past two weeks hog markets took on a keen edge and cut its way to the highest levels since October. The entire list attained an $8.00 or better level on Wednesday, but in the past two days weakened moderately from the extreme high level. The top reached in Chicago was $8.47½, in St. Louis $8.55, and in Kansas City $8.20. Other markets were relatively higher than the Kansas City market early this week, but in the past two days there has been a moderate readjustment. Light receipts caused the general advance in prices, which compared with two weeks ago was 60 to 70 cents, and compared with the low time in January was close to $1.00. Diminishing supplies caused the advance, and still higher prices are expected. Thus far this year the five Western markets received 520,000 fewer hogs than in the same period in 1912. The hog price record was made March, 1910, when $10.50 to $11.00 was quoted. That level is not expected this year, though March will probably uncover the $9.00 hog. The packers have lost control of the situation, and with shippers buying eagerly, light and medium weight hogs are binging premium over heavy grades.

The following quotations are for hogs:

Choice, 250@300 lbs	$7.90@8.05
Choice, 200@245 lbs	8.00@8.10
Medium weight	7.95@8.10
Light weight	7.45@8.00
Common to fair	7.00@7.50
Stags	6.25@7.75
Boars	4.50@7.25
Bulk of sales	7.90@8.05



The following table shows the range in hog prices in the past two weeks:

		Preceding Week.
Mon., Feb. 10	$7.65@7.85	$7.30@7.60
Tuesday	7.85@8.20	7.35@7.70
Wednesday	7.90@8.20	7.40@7.75
Thursday	7.90@8.20	7.35@7.65
Friday	7.80@8.10	7.40@7.75
Saturday		7.50@7.85

No Important Change for Sheep.

Prices for sheep fluctuated 25 to 40 cents in the past two weeks, and are closing this week net unchanged. Receipts have been fairly liberal, and the quality is good. Hay fed sheep from the Northwest, which were a depressing influence in the market, have about all been marketed and corn belt and Colorado fed sheep have practically a clear field for the next two months. The present outlook is for stronger prices as no large supplies are in sight. Shearing of heavy fat

Furnished complete --- No Extras to Buy $1,875, f. o. b. Detroit, Mich.

48 Picked Engineers Build a New Car

All that is known in motor car design is embodied in the experience of the HUDSON engineering board. These men had a hand in the construction of over 200,000 automobiles of 97 well-known makes.

There are men on this board from every automobile building nation—Germany, France, England, America, Austria, Hungary, Italy and Belgium. In constructing their latest model, they worked under the direction of Howard E. Coffin, America's foremost designer.

It is the four cylinder masterpiece of the largest engineering board in the automobile industry.

Howard E. Coffin built six famous cars, more than any other engineer. He never created a failure. He has always led in four cylinder construction. Yet even he could not have conceived so remarkable a motor car as has this great body of experts by combining their ideas.

They have built a simple car, one with several hundred fewer parts than the others in its class and simplicity the keynote to now upkeep. You have noticed this is you have ever owned a car of complicated design.

New HUDSON "37"

In any automobile the design of which is not well balanced, rods, wires and supports are necessary. These things need attention and constant adjustment. That takes repair men's time. It costs money. This simple car has none of these.

A Dustproof Car

These engineers have built an automobile that is fortified against the most ruinous element a motor car must face—dust.

Dust, dirt and grit work their way in through the valves of the average motor, eat into the bearings and shorten the life of the motor—the very heart of an automobile.

But these engineers have enclosed the valves, valve mechanism and all moving parts, making them impregnable to the ruin of dust, dirt and grit. They have built a dustproof car.

Electrically Self Cranked—Electric Lighted

There is nothing in the operation of the car that cannot be accomplished from the driver's seat. You press a button to crank the engine. The electric Delco self cranking system has an electric motor, the transmission of which meshes with the cogs of the HUDSON'S flywheel, a positive self cranking method.

In addition, when the engine is running, it generates electric current which is stored in a battery to be used for lighting at night and in starting the car.

Three buttons on the dash control the head, tail, side and dash lights.

The Most Beautiful 1913 Car.

Motorists have termed the New HUDSON "37" "the most beautiful 1913 car." Its long, handsome, sweeping lines and its Americanized European body construction, make the New HUDSON "37" a car that men who last year bought $5,000 and $6,000 cars are proud to own.

In comfort the HUDSON is supreme. Its 12-inch Turkish type upholstery, over three-quarter elliptic springs, makes the car so remarkably easy riding that this fact alone has decided many sales in its favor.

The large, roomy tonneau and the ease of entering the car are other features appreciated by the wise motorist.

It Is a Proved Car

When the engineering board of the Hudson Motor Car Company had designed the HUDSON "37" it was placed in the hands of a racing driver to test the car. He worked it out over 20,000 miles at train speeds. His course consisted of the worst roads he could find in ten states, the Allegheny Mountains and Southern Canada.

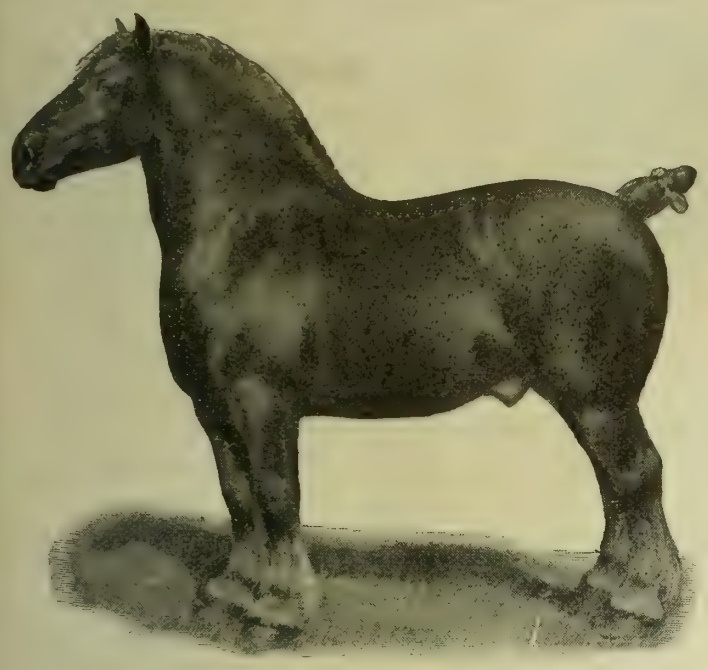
The battering which he gave the car was the equivalent of 40,000 miles service in the hands of the average owner of four years' average use.

When he finished the tests, not a single change from the basic design decided upon by these experts was made. The car was then publicly announced, for from an engineering standpoint is was perfected.

You cannot gain an adequate appreciation of the New HUDSON "37" from what we have said here. Its extraordinary beauty, comfort and the correctness of its mechanical design can only become known to you through a personal investigation and inspection of the car.

Go see it today at the nearest HUDSON dealer's. If you do not know his address, write us and we will put you in touch with him.

May we hear from you at once? Write today.



HUDSON MOTOR CAR COMPANY

Blue Mound, Linn County, Kansas

sheep before marketing will begin early in March. Choice fat lambs are quoted at $8.25 to $8.75; fair to good, $7.75 to $8.25; yearlings, $6.75 to $7.50; wethers, $5.50 to $6.25; ewes, $5.00 to $5.75.

RAISING GOOD CALVES.

To the American Breeder: I will try and give you my idea of how to raise young stock for breeding or butchers' purpose. I would take them both the same, as I think that all young things should have the best care, whether for breeding or for killing purposes. The prices that have been paid for baby beef during the last fall and this winter so far, make it an important item in the all round farmer's business.

Now we will take for instance a farmer that has six good grade cows, these cows should have their calves not earlier than February and not later than May. Take good care of the cows and the calves, do not let them out in the cold or wet. Let the calves have good exercise until you have good pasture. Let them run with the cows during the first part of the summer, until the flies begin to hurt them; then bring them to the barn or shed away from the flies if possible during the day time. Let the cows come up at night and turn the calves out at night with the cows and bring them up in morning.

By this time you will have some green corn in the roasting ear. Give the cows a feed night and morning, chopped up fine. They will eat it clean, stalks and all. Nothing will bring you more money. Teach the calves to eat it with oil meal or cotton seed meal and they will be on full feed by the time you want to wean them. Let them suck the cow until two months of her next calving. Feed the calves good all through the winter and summer and by the second week in December your yearlings will weigh 1,200 pounds, or more, and top the market. I know they will do it as I have done it myself and what one man can do another can.

Mr. Ben Duncan of Kansas City, sold one steer, that I fed last year for $154.40. It was calved March 23, 1911, and sold December 11, 1912. He was sired by a good Shorthorn bull. This steer lost one month feed by not having the right treatment. Thos. Minton, Cooper County, Mo.

GOOD THOUGHTS ON AN OLD SUBJECT.

To the American Breeder:—While I know that this topic has been discussed time and again, human nature differs greatly as to the time it takes to learn the care of animals. People forget or neglect things that should greatly interest them. We are approaching another season and it is time that we should be preparing a great many things on the farm, but above all, the care of the stallion should be of vital interest, for without due care we should not look for him to get his mares in foal.

Of course every man who owns a stallion should have a suitable stable, warm, but with the best of ventilation, with door to the south and a corral about 32x48 feet or larger, to run in at times if weather and condition of ground permit. His stall should be level and cleaned every day and well bedded at evenings and he should be kept in it at night on account of possible storms coming, causing him to catch cold, and leading to many temporary ailments which in time might throw him out of balance and cause him to be unfruitful. One man should feed him at all times and although late, a warning in this respect will suffice. Never from the present time until about the last of October, should a stallion be fed corn. Feed him good clean oats three times a day and at noon a feed of oats and bran, be it wet or dry, never under any circumstances feed very much hay, and if possible, select clover or alfalfa. Be sure it is well cured and bright, for musty feed of any kind will cause trouble. See that your horse gets salt at will and see that he is well groomed so that there will be no cause for different skin diseases. If your horse is exercised and fed properly in proportion to size and breeding, you will have no trouble getting him to settle his mares.

Right here is the thing importers and small breeders have to combat. Perhaps 75 per cent of the stallions are ruined by carelessness or ignorance on the part of their masters. I believe this is a great injustice to the stallioner. Why not have mares undergo the same law.—A. Kool, Marion County, Iowa.

IRVINEDALE BELGIANS

Imported and home-bred stallions and mares. All ages. Prize winners and the produce of prize winners. Top quality at reasonable prices. Address,

CHAS. IRVINE,
ANKENY POLK COUNTY, IOWA.

HE WILL CONVINCE THEM, TOO.

To the American Breeder: I am not much on the write as a correspondent, but if I could get all my patrons and neighbors to believe as I do, they would raise about two to one more colts than what they do. Last year was my first year in the capsule work. I certainly made a success of it; bred 127 mares and am sure of 90 safe in foal, and maybe more. I handle the horse at Beardsley, Minn., but my home is at Burtrum, Minn., and to tell the truth, this vicinity is 25 years behind the times. Talk to them and they laugh at you, for they think it impossible to use capsules and that

IMPORTED BELGIAN

For Sale or Exchange.

One imported Belgian; color, chestnut; 12 years old; weighs 1900 pounds; 16½ hands high. Our reason for selling is that his fillies are in his way. Will sell this horse reasonable, or exchange him for another. **Sauer Bros., Sanborn, N. D., R. F. D. 2, Box 39.**

IMPORTED STALLIONS.
BELGIANS AND PERCHERONS.

Have just arrived from Belgium and France with new importation of Belgian and Percheron stallions which I would like for you to inspect before buying elsewhere. Barn in town. **C. W. Babcock, Walford, Benton County, Ia.**

Walford is 4 miles southwest of Fairfax on C. M. & St. P. R. R.

IMPORTED BELGIAN STALLION.

Black; coming 8 years old; weighs 1900 pounds; to exchange for another. Colts in the way is the reason for exchanging. Never has been beaten at fairs. Plenty of colts to show and plenty of bone. **B. D. Prentice, Laird, Yuma County, Col.**

FOR SALE OR TRADE

For registered Belgian stallion, Victor II, 2466, a large Kentucky jack; black, white points; a good, sure breeder. Colts to show. Weight 1000 pounds. **Hogan & Stover, Greenleaf, Washington County, Kas.**

SHIRE STALLION

For sale. A good imported black; 4 years old; sound; weight 1800 pounds. **Magnuson Bros., Osceola, Polk County, Nebraska.**

third service is as good as the first. In 1912, at Long Prairie, they held a Farmers' Institute. I had just received my extractor and capsules and had them there and showed them as near as I could how it worked. Well that was very well, but they argued that the semen was weaker because there was not a quart used. Then I explained that the one service a day made the semen that much stronger. Some could see and others could not, so that is the way it stands. But maybe I will get a chance to convince them yet.—Scott Huntosh, Todd County, Minn.

DON'T CASTRATE TOO EARLY.

To the American Breeder: I note what Mr. Thomas of Ada County. Idaho, has to say in regard to castrating colts too young, and I think he is right. He must have studied the horse business a great deal and had lots of experience with large bunches of geldings from the way he has written on the subject—I am now 45 years old and have been on the roundup ever since I was 14 years old, working for big cow outfits, which used from 100 to 1,200 head of geldings to do the work with the cattle, as it was all range work and was done without corrals or pasture. There had to be a man with the saddle horses day and night so as to have them when they were needed and to keep any from getting away. I know, as I have been with them all hours of the day and night, in all kinds of weather, and always made a study of their actions. Of course, when the summer work was over the saddle horses were turned loose on the range to run until the spring roundup commenced, so the first work that was done was to round up the saddle horses, which took the men about twenty days.

What I want to say in regard to castrating colts too young, here is where you can learn and see the results of castrating too young. A man that had no mares, and with none around for his saddle horses to get with, could round his up in one-fourth of the time his neighbor could that turned his loose with a big bunch of range mares, as they would be scattered to the four winds by spring. He could also hold his and keep them all without losing any and they were not much trouble to him; while his neighbor, who turned geldings loose with mares, the chances are that he never found them all and there are some that are trying to get away all summer and go back to the mares. The chances are he will lose a few of this kind and perhaps take more with them. There is many a horse ridden down hunting for this kind, while I always note that these mare geldings, as I will call them, were invariably always horses that had been castrated too young, in fact these geldings that were castrated too young were as hard to separate from a mare as a sucking colt would be, and harder to keep away, as the colt will forget its mother in a few days and the old mare geldings never will forget the old mare and the old range he has been used to running on. I always take notice these mare geldings could never stand the work that the others could. They are also harder to teach anything and are much easier to get scared at anything and want to run away, and they are much harder to break than a horse that runs until he was matured before castration. Did you ever notice that a stallion is no trouble to break to work? If you never did, just notice once that they are no trouble at all. I have broke all kinds, even the old wild mustangs that used to run there on the plains in West Texas in the early eighties. They had never seen civilization, didn't know what a white man was, corral, horse barn or rope, so let me tell you something, Mr. Farmer, let your colts run as long as you can before you castrate them. Don't be afraid they will get too old, the older they are before the job is done the better horse you will have. —L. D. Carter, Canyon County, Idaho.

FAVORS EARLY CASTRATION.

To the American Breeder: I note in December 20 issue of your valuable paper an article written by H. A. Thomas of Ada County, Idaho, my neighbor state, on castrating colts at ages over one year. I can hardly agree with Mr. Thomas, as I understand his reasons, that is, they are not as apt to become foul. Now if every horseman was of the same opinion there would be no room for an argument, but I am not courting an argument.

I will state my experience of forty years of horse experience and general castrating. I have raised colts, three in number, all from the same horse and same mare; two of them had large sheath and penis and one had a small sheath and penis. I don't think that it makes any difference about the castrating in regard to the foulness of a horse; if the sire has a large sheath his progeny will be apt to follow after him. As to the toughness, I have raised as tough horses as ever lived and cut them at 5 and 6 months old. I have seen horses castrated at 6 years that had no bottom or endurance, and I think Mr. Thomas has seen the same thing. One great fault I have to letting horses go until they are 2 to 4 years old, they generally have a beefy head and throat latch. If they are cut at 5 or 6 months they almost invariably swing both testicles and they can be castrated without the least danger, and they hardly notice it and keep right on growing. They have a cleaner throat latch, a bonier head and are trimmer all around. As to the toughness of a horse, it depends on the sire and the dam as much as almost anything else, and then the right kind of care to go with it from colts up to the time of breaking.

I will say in short that I have experimented on them at all ages and will say that 6 months at the most is the most satisfactory age with me. If there are any old experienced horse men that don't think as I do I would be glad to see it in print in the best paper of its kind published—the American Breeder. O. H. Dunham, Uinta County, Wyoming.

SOMETHING DIFFERENT.

To the American Breeder:—I have been in the stallion business for 13 years and have stood 18 different horses and I am sure that they were not all alike in nature and in breeding condition. I had one black Percheron stallion that did not pay for his feed in getting colts, when he was young. As he grew older he became better. When he was ten years old I did not give him any exercise at all except from his stall to the teasing place and he served 76 mares and got 66 living colts. The next spring I took him out on the road quite a lot and he fell down one-half on the same mares. I then bought two imported horses. One of them was a four-year-old and was a money looser the first year. The other was a five-year-old and he served 107 mares in three months and 97 of them were in foal and the next year he served 140 from February 26 until June 10 and settled 111. If he could have stood three weeks longer he would have gotten at least 125 or 130, but I sold him on June 1 with the privilege of keeping him until June 10. This horse served as many as four mares a day and from February 26 until June 10 made a gain in flesh of 110 pounds. He weighed 1,990 at beginning of season and when shipped out, 2,100 pounds.

Now, I am going to give you some of my experiences with barren mares. I do not believe in that at all and if my horse has plenty of time, such as in the fall, I can get every mare in foal.

BELL BROTHERS

Assure Intending Buyers Of

BELGIAN STALLIONS

A choice of some of the highest class stallions of the breed to be found in America.

Come now to see both Belgians and Percherons.

BELL BROTHERS

WOOSTER - - - OHIO

"Convenient From Anywhere"

Percherons and Royal Belgians

We have decided to offer all of our state fair prize winners—22 stallions and mares—for sale. Every one of these horses have been shown and has been a prize winner at the shows of 1912. These stallions and mares will be sold at exceedingly low prices, quality considered.

We are showing some other good stallions and mares, which we offer at prices that defy competition.

We earnestly request you to look over our stallions and mares before buying.

True photos from life on application.

Address,

Four Royal Belgians imported by us in 1912.

Fairfax, Linn County, Iowa.

W. A. LANG & CO.

Greeley, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS and MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible, and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars, mentioning this paper.

D. K. ROTH

GIBSON CITY, ILL.

IMPORTER AND BREEDER OF BELGIANS AND PERCHERONS

Not How Many, But How Good.

Square Dealing My Motto. Write Me Your Wants.

Pioneer Stock Farm

The Home of the Belgians.

We have for sale the classiest bunch of imported and home-bred stallions and mares we have ever offered for sale. Got first premiums and grand championship in every class we showed in at two state fairs; eight firsts and two grand championships at Oklahoma City and 12 firsts and four championships at Hutchinson, Kas. Any one desiring a first class stallion or mare will do well to see this fine bunch and get prices.

STALLIONS and MARES

Percherons and Belgians

In addition to the large number of Prize Winners at the French and Belgian shows this spring in Europe and at the various state fairs in this country this fall, we have a very large lot of good young stallions and mares of extra quality and bone, that we will price very reasonable.

We can show you 150 head o horses of the different breeds, the best lot ever imported to America. Sold with a reliable guarantee.

J. CROUCH & SON, Props. LAFAYETTE, IND.

TAYLOR & JONES

Williamsville, Sangamon Co., Ill.

Our new horses are now in the barns, and we have an extra good lot of Belgians, Percherons and Shires. We invite buyers to call and look them over. We buy the best we can buy, and if there were any better to be found we would handle them. Our guarantee is safe, and we can protect a buyer from loss for the full purchase price. Come and see us. It won't take long or cost much, and we feel sure we can save you some money.

TAYLOR & JONES, Williamsville, Sangamon County, Ill.

REGISTERED DRAFT STALLIONS

and mares, coming 3 to 5 years. These are good colts of the draft type.

One 11 year blue jack, cheap.

W. L. Lake, Ft. Cobb, Caddo County, Okla.

Do just as a horse and mare would do if they were running out. Breed them as often as you look at them and they will become in foal. In 1911 I traded for a good mare that was 16 years old and had never had a colt. Had been bred to jacks and horses every year until stallion owners would not have her any more. The man I got her from said that I would just wear my horse out trying to get her in foal. I said that we would see, and when she was ready we began and it just took me 12 days to get her in foal.

About six years ago a man by the name of Ed. Blen er brought me a very nice big bay mare and said that he would give me double the price if I got her in foal. I told him if he would pay for the mare's feed bill and leave her with me I would get her in foal and if I did not I would give him a colt out of one of his other mares. He bred seven mares to my horses. I had four at the time. He left the mare and at every chance I had with any of my horses, I took her in the ring and it took me 60 days to get that mare in foal. She was served twice one Sunday, when the horses were not working and the last service settled her. If any one does not believe this they can write to Mr. Ed. Blender.—Mike Quint, Ellis County, Kansas.

FROM MARE OWNERS' STANDPOINT.

To the American Breeder:—The popular topics seem to be, Drafting Laws for the benefit of the stallion owner and educating the mare owner. Why not have a law that will benefit the mare owner as well as the stallion owner? The average stallion owner will let his stallion serve every mare brought to him, whether the mare is diseased or not. Probably he won't know th diseased, or maybe Jones who owns the mare is a good customer and might take offense if told his mare is diseased. This is a case where both stallion and mare owner need educating. W. H. Reid, in the January 20th issue, has a good plan on having doubtful mares examined by a veterinarian. Why not have a law compelling every stallioner to pass an examination as to his qualifications for telling a diseased mare and have a penalty for mating his stallion with a diseased mare. I think that many good brood mares are made barren by being mated with a stallion that has previously served a diseased mare. While I admit that the average owner needs educating along these lines, I think that the average stallion owner needs it worse, for it is he who mates his stallion with diseased mares and causes many a mare owner losses as well as himself.

I want to say also that I am in favor of the colt stand and suck way of breeding, because I think the stallioner will be more particular as to the condition of the mares he mates his horse with and, second, the mare owner has any number of risks to run before his colts are matured ready to put on the market. In the January 20th issue of the American Breeder, I see an article, a plan to divide the risk. This plan may be all right in some cases, but it won't do for all, for there are stallion owners who would be right after that ready cash. If they got half of the service fees at the time of service they would most likely breed more mares than they would otherwise, figuring that if they breed four mares a day at $7.50 cash each, and a chance for another $7.50 each, it would be better than breeding two mares a day at $15.00 each and taking the risk of them being in foal or having a live colt. Possibly they would see a chance to sell or trade their stallion at the end of the season and the more ready cash they can get the better. You will hear some stallion owners say they can't make anything at the colt stand and suck plan of breeding;

BREEDERS' SALE

45 STALLIONS AND MARES 45

AT FAIR GROUNDS **BELOIT, KANSAS**

LAMER'S ←

PERCHERON SALE

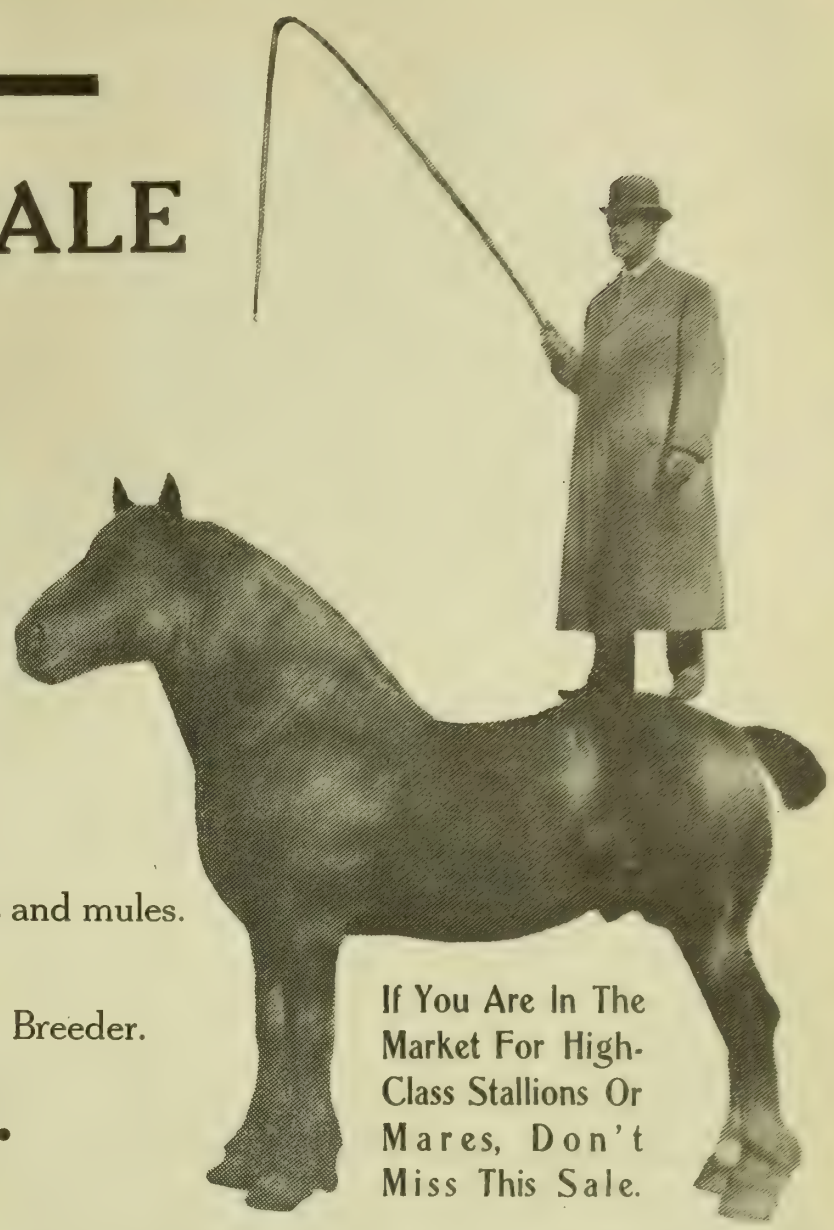
SALINA, KANSAS

THURSDAY, MARCH 13

44 Head—20 stallions; 12 of them imported, all 3 year olds, weighing 1800 to 2100 pounds.

More weight, bone and conformation than has ever been offered at auction. The home bred stallions are 1 to 4 years, and as good as grow.

24 Percheron mares, 1 to 5 years old.



P. S.—I will also sell 100 head of work horses, farm mares and mules.

SALE STARTS 10:00 A. M.

Write today for the catalog, mentioning the American Breeder.

C. W. LAMER & CO.

SALINA, KAS.

If You Are In The Market For High-Class Stallions Or Mares, Don't Miss This Sale.

why can't they? Because they don't use and care for their stallions as they should. I don't think that a stallion should serve more than two mares in any one day of twenty-four hours and those services not closer than eight hours apart. I now recall to mind a case where a stallion owner let his horse serve two mares in the forenoon and three in the afternoon. The man that brought the last mare asked the stallioner if he had bred any mares to his horse yet that day, he was told only one and that was in the morning.

I think if the average stallion owner was educated a little more on the breeding business he could make himself as well as his patrons more money. If the capsule system of breeding is a success, which it apparently is, according to reports, I believe the average stallion owner, by using this method, could adopt the colt stand and suck plan of breeding, breed for less money and double or even treble his present income. I am in favor of giving the stallion owner a lien on the mare and colt for six months from date colt is foaled, but he should be compelled to collect the service fee within the six months. I don't say this to give the mare owner a chance to get out of paying an honest debt, but to protect a purchaser of these animals. Let's hear from other mare owners. Yours for better sires and more colts.—A South Dakota Mare Owner.

CURIOSITIES, A COMPLIMENT AND AN IDEA.

To The American Breeder: Medical book publishers have compiled a work on the curiosities of meidcine called "Snomalies and Curiosities of Medicine" Gould and Pyle, and here one can find something about the old types of men and other strange things that has afflicted men in different parts of the world since Adam. But it remains for some genius to compile a similar work on horses, as the Moose Nose; the lop eared; the one with one more leg than the others, hairy horses, hairless horses, milking horses, like the little brown Tartar mares, some born without tail bones (rabbit tailed), the giants, midgets, etc. Or on cattle—the small Chinese cow, huge cattle, trotting oxen, etc. The odd things about sheep, and four horned hogs, dogs and the circus freaks and the hybrids now to be found in menageries among the wild animals.

Those who have made horses a study have found many strange things that as yet, but little literature is found relating thereto. As for instance osteoporosis that running horses are said to get from an absence of lime salts from being raised in certain localities, while bulletins again dispute this theory, telling how eating millet causes it; how horses seem to get heaves by coming to some places; how horses get to be "dummies"; why some running horses look to be fleet with pedigrees running back straight to a century, yet are failures; why some horses go knee sprung, others are stumblers; why some go over in Thrombosis both in front and behind. Another thing is the bad shaped feet behind, as seen in a jack, which I have found among Shetland ponies, mules and horses. There is also many strange things found among cattle, sheep, hogs, dogs, that is more interesting to a breeder than the anecdotes of animals found in story books.

This letter is prompted by reading about the sloping croup, and in draft horses in this issue of your paper, by E. A. Wentworth. Here's hoping there will be many more papers in your paper of original stuff, as I am tired of the stereotyped horse news that I find in most other horse papers. In Gobaux's "Exterior of the Horse," mention is made of the bad hind feet, as in the jack mentioned, and of the brain disorders of "dummies" and balkers. D. J. Doran, 233 Hudson St., Gloucester City, New Jersey.

PERCHERON, BELGIAN AND SHIRE STALLIONS

Imported and American Bred.

and dealers in American bred draft horses and Standard bred horses and high class jacks. Will sell at right kind of prices and terms to suit purchaser. Give us a look before buying elsewhere.

Fisher & Walker, Evansville, Indiana.

Aunt Becky and Old Betts

Written for the American Breeder.

Grandfather Cole was a "Hoss Doctor." He had bled "hosses" and gave pokeroot tea and things along the Muskingam, in South Ohio.

In the spring when "the sign was going down" he "throwed colts" and clamped them with "shoemake." I have seen Uncle Asa Cole do the same. We all came to Henry County, Ill., in the fall of '53. Uncle Asa, Aunt Becky and four kids, my father and family. Uncle Asa drove Jack and Betts, a good team, 1,100 pounds each, a wide track wagon, "strap skein" and "linch pin." He rented 80 acres for grain and moved in the log cabin and next spring Betts had her first foal. Jack had to plow the corn. Every spring about time to plant corn, Betts had her foal. We planted with the hoe then. Every summer Jack had to plow the corn. This continued until Betts had nine foals and Aunt Becky could count the same number at the table and around the fireside, then old Betts missed one year and could only produce a foal in two years until she was past 21 years. When Betts had a count of 14 foals and every one alive and Aunt Becky had a count of seven buxom girls and three stout boys out of a total of thirteen, the race was finished. And while both done well, I always thought old Betts was the most help to Uncle Asa and Aunt Becky they had. Betts' foal bought one-half interest in the first McCormick reaper in Henry County in trade. One foal brought to Uncle Asa his first stallion. The reaper and the stallion fees, $5.00 each, and the continued addition of the foals dropped time after time, gold pieces in an old shot sack and when the war of '61 broke out an old Hardshell Baptist preacher who was an old Hardshell Democrat wanted to sell his 40 acres and leave the North to take care of itself. Uncle Asa asked the price, answer was $40 per acre in gold—no "Lincoln shinplasters"—Uncle took his shot sack and counted $1,600 and owned his first piece of land. He moved Aunt Becky, the kids, old Betts and all on his 40 acres. The three died on that 40. Betts at 27, uncle and aunt at 75 and 65, leaving an estate valued at $75,000 to $80,000. The question arises, why did he not get more brood mores like Betts? My answer is, first, he did not know her value; he did not see what she was doing for him until after it was all done, and then where could another mare like Betts be found?—N. P. Mayhew, Cherry County, Neb.

SIX COLTS IN SIX YEARS, $1,535.

To the American Breeder:—In regard to the best female producers, I have one registered Percheron mare that raised six colts in six years. The two first colts were fillies and four stallions which I have sold from the age of nine months to two years old, that gave me the sum of $1,535.—Dona Allard, Plymouth County, Iowa.

HOW IS THIS FOR BUSINESS?

To the American Breeder:—I noticed your article, "The Best Female Producers." I have a mare, half Percheron and half Shire or Clyde, which I bought unbroken, coming four years, old, just a fair, common mare. Horses being cheap, paid $110; bred her in spring, raised colt, selling same colt, coming three years old, for $147.00, when horses were yet cheap. Next two colts sold when four and five years old at $500. Next mare colt died when three years old, which I valued at $300. Next, a gelding, got wire cut and small spavin, but would have been worth $275. Sold for $150. Next a mare, I valued at $275, died when about two weeks old. I have

"AMERICAN BRED PERCHERONS"

Anthon 25137 (45446) by Besique (19602), at head of herd. We have on hand several fillies and stud colts sired by Gouveneur 55323 (70200), for sale. Also a black stallion of fine quality coming three years old in July, for sale. Come and get a colt where you can see the sire and dam. Onarga is eighty-four miles south of Chicago on the I. C. R. R., and about seventy-five miles east of Peoria.

H. KNOCHE & SONS, Onarga, Ill., R.F.D. No. 2

WHITE OAK STOCK FARM

American bred Percheron Stallions and Mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to **D. Augstin, Carlock, Ill. R. F. D. No. 2.**

Carlock is on the L. E. & W. Ry., and thirty-miles southeast of Peoria, ten miles northwest of Bloomington, Illinois.

FOR SALE AT RIVERSIDE STOCK FARM

A fine lot of registered Percheron colts broke to service, weighing 1,600 to 1,775 pounds. Two year olds that weigh from 1,450 to 1,650 pounds; good colors of black and grey. These are the big bone kind and any colt out of eight head will mature into a ton horse or better. A few good imported and home bred mares for sale. I have mares weighing from 1,900 to 2,100 pounds.

Also a few large Mammoth bred jacks from 15 to 15½ hands high, all young.

It will pay any breeder to come to our farm and look this stock over before buying. **O. L. THISLER, CHAPMAN, DICKINSON COUNTY, KANSAS.**

150 miles west from Kansas City on the Union Pacific, main line.

IMPORTED PERCHERON AND BELGIAN STALLIONS AND MARES

Also Home-Bred Stallions.

I think it is better to have extra good stallions to show when customers come to see, than it is to claim you have them and cannot show.

If interested, write or come and see me.

J. R. JUSTICE, GALESBURG, ILL.

At Union Hotel, Bell Phone 237, or Union Hotel.

PETER HOPLEY & SON,

ATLANTIC and LEWIS, IOWA,

Importers of PERCHERONS and SIRES

We have been making from one to three importations a year since 1884 of the best stallions and mares that we could find in France and Great Britain. **We have now the best lot of both breeds** of stallions and mares, nearly all two-year-olds, that we have ever had on our farms at one time. **They excel in weight, bone and quality.** We have two-year-olds weighing in moderate flesh **up to 1,950 lbs.** We have secured a number the get of the most noted sires in France and Great Britain. **We have a number of top show horses.** We want you to come and look them over, and you will agree that what we have said is conservatively stated, and in spite of our selections we are able to quote very moderate prices. Remember, our horses are all kept at the farms between Atlantic and Lewis, on the main line of the Rock Island, 60 miles east of Council Bluffs.

YOU ARE WELCOME

Whether You Buy or Not

We want to get acquainted and talk stallion business with you. It will be interesting. Price and quality the convincing argument. Satisfaction another link in the chain binding us to our old customers. It will be a step forward when you buy of us. Write or wire us when you will come.

IMPORTED AND HOME BRED STALLIONS.

I will sell imported stallions, $800 to $1,000, except two stallions. Home bred stallions, $300 to $600. Come and see my horses. **Frank L. Stream, Creston, Iowa.**

three good young suckling, one yearling, one two-year-old, all good. Mare is in foal now, and always ready for work; is carrying the eleventh colt in succession. This mare was always bred to a pure bred Percheron stallion. I have heard of others doing better, but more not so good.—H. Zachgo, Iroquois County, Ill.

NO GUARDIAN NEEDED.

To the American Breeder:—Five years ago I bought a half blood Percheron mare, five years old, and weighing about 1,400 pounds. I paid $200 for her and some of my neighbors thought I needed a guardian. Well, after working her first colt two seasons, I sold him in August as a three-year-old at $160. Last August I sold her three-year-old filly and two-year-old gelding for $325. The filly had nearly ruined one foot on a wire, or I would have got $50 more. I have a fine yearling and the mare is due to foal again in a few weeks from a good horse. To sum up, I have seven years' hard work, counting work of colts, one good yearling, $485 and the mare would bring more than first cost "under the hammer." This is not extraordinary, but beats working geldings. I forgot to say that the mare failed to settle once, from neglect.—J. S. Howe, Richland County, Ill.

MARES THAT PAID.

To the American Breeder:—I read in one of your issues, asking that production statements of brood mares be sent. About sixteen year ago I bought Nell, a five-year-old mare, ⅞ Percheron. I always bred her to the best sires that I knew of; she raised one mule colt and eight horse colts and lost one, making ten colts foaled in all. I have sold all of her offspring, excepting the first and last colt. The mule colt I sold at weaning time for $50, when horses were cheap. The horses, six head, sold for $1,189, which would be $198 per head. And as I also stated that I had two left of the offspring, one gelding and a mare, Coaly, coming 14 years old this spring. She has raised six colts and lost her last year's colt, but is in foal now. I have sold only one of her colts for $200 and have the others left; was offered $325 for one of Coaly's mare colts, five years old. I forgot to state that I sold Nell, the first mare, four years ago last fall, for $100.—J. W. Syfert, Sumner County, Kas.

PROFITABLE PERCHERON MARES.

To the American Breeder:—I have two recorded Percheron mares, which I think have been good producers, although I haven't owned them but a year. One will be 13 in the spring, has had eight colts from nine services; seven colts were mares. I lost a sister last month coming seven years, carrying her third mare colt from four services. She missed as a five year old. I bought a mare in the Barnes & Redman sale at Oskaloosa, Ia., the 23d of Nov., 1911, which will be 10 in the spring and is carrying her eighth colt, five of which have been horse colts. Her three-year-old colt sold in the sale for $900; her two-year-old the spring before sold for $600, private sale. I sold her mare colt last August 12 for $200, foaled May 5, making a total of $1,700 produced by her in four years and Mr. Barnes still has a stallion colt by her which will be two years old this spring. I paid $410 for her and have sold one colt at $200 and am offered $400 for a pair of mare colts from her and her mate this year.

I think this ought to convince any one that the drafters are the best to own, for any one can handle them just as profitably as I can, and the majority of people a great deal better than I can. I bought a mare of Mr. Barnes seven years ago, but had bad luck with her, so will not mention her

North & Robinson Co.

IMPORTERS AND BREEDERS OF PERCHERON, BELGIAN AND SHIRE STALLIONS AND MARES.

50 head of American bred pasture raised stallions from 2 to 4 years old. The good, rugged, stocky Tiger built fellows, with plenty of bone, weight and quality. 40 head of American bred mares as good as grows at bargain prices.

We always have a good assortment of imported stallions and mares weighing a ton and over. Next importation will arrive February 10.

Every day a bargain day at our barns.

Large horse calendar sent free to horse breeders.

NORTH & ROBINSON CO.
GRAND ISLAND, NEBRASKA.

IMPORTED PERCHERONS AND BELGIANS

I have a lot of the best specimens of the two leading breeds. I have personally selected them carefully for big bone, with quality, style, action and breeding, with weight from 1800 to 2200 pounds. I give a gilt edge guarantee, good for two years, with every horse. I am going to sell them down very cheap, considering the quality. Barns are four blocks from A. T. & S. F. depot.

W. H. RICHARDS, D. V. S.
EMPORIA, KANSAS

HOMEWOOD STOCK FARM
Percheron, Belgian, Shire Stallions and Mares

Now is the time to buy a good stallion or mare. We have the kind you have been looking for. Our horses arrived home in October and are now perfectly acclimated and in the best of condition to do you a lot of good.

The Percherons are two and three years old, with size, bone and draft horse quality—many of them weighing over a ton, and not fat.

Our mares are of the best brood type; all are in foal and plenty of ton mares to select from. Every animal guaranteed sound, and a satisfactory breeder. Others say we have the best bunch of two-year-old Percherons they ever saw; you will say the same. Come and see us or write for full particulars. You will find horses right, terms right and prices below others of equal merit. We have also a lot of big, heavy boned, American bred stallions at surprisingly low prices. Don't buy until you have seen our stock.

Homewood is on the main line of the Big Four and I. C. R. R., twenty-three miles south of Chicago. Trains hourly to and from the city.

S. METZ & SONS, Bell Phone, Homewood 58 W. Homewood, Ill.

PARAMOUNT STOCK FARM
BREEDS AND IMPORTS

PERCHERONS, BELGIANS AND SHIRES

My November importation is ready for business. My two year olds are weighing 1,860 to 2,000 pounds; three year olds and over, 1,900 to 2,250 pounds. They are high class and sound. I am making prices that sell. I will pay any man's expenses that can say he is disappointed in the size and quality of my horses. Seventy-five head to select from. Write your wants. Send 10 cents in stamps for large picture of the horse parade.

Experienced Groom Wanted.

WM. CROWNOVER Hudson, Iowa

Stallions and Mares
At Bargain Prices
PERCHERONS, BELGIANS and SHIRES

NINETY-EIGHT HEAD FROM WHICH TO SELECT.

Forty Percheron stallions 2 to 4 years old; blacks, greys and a few bays. All registered in the Percheron Society. Several of these two year old will now weigh from 1800 to 1950. Price $500 to $1000. Three a little higher.

Fifteen Belgian stallions, 2 to 5 years old; bays and sorrels; two-year-olds that are weighing a ton. Price $500 to $1200.

Thirty Percheron mares, 2 to 8 years old; blacks, bays and greys. All registered in the Percheron Society; 22 showing heavy in foal. Price $300 to $700.

Ten head of Shire mares and stallions that I will sell at bargain prices. All of these stallions have been examined and found to be sound and of pure breeding, and certificate of such will go with each horse. If you want a real bargain in an imported or American bred stallion or mare, come right away as I mean business

L. R. WILEY, Emporia, Kans.

Rhea Bros., ACCLIMATED PERCHERONS

We have 40 head of stallions on hand today. Ages from coming two to five years. The older horses weigh from 1,900 to 2,200 pounds and are not loaded down with fat.

These stallions have been raised in the open fields and are acclimated and will breed from the start. You cannot over-estimate the importance of acclimation—it means much to you.

Our horses have more bone than is usually found among Percherons, and they are clean jointed and sound.

We are offering stallions at very reasonable prices, far below what the same class of horses are usually quoted; but we raise them here on the farm; raise our feed and can afford to sell cheaper than others not so favorably situated.

Every stallion fully guaranteed. Life insurance furnished at cost if desired. If interested in Percherons we ask you to come and see us or write today.

References—Packers Nat'l Bank, So. Omaha; Arlington State and First Nat'l Bank of Arlington, and the Citizens State Bank of Blair, Neb.

Arlington is on the main line of C. & N. W. R. R., 34 miles northwest of Omaha, 55 miles north of Lincoln, and eight miles east of Fremont. We have 12 passenger trains every day.

RHEA BROS. :-: :-: Arlington, Nebraska

Percheron and French Draft.

Stallions for Sale—Twelve head American bred, big bone, low down, blocky kind, from 2 to 4 years old. Sixteen registered crosses of our own breeding from the best sires obtainable. Broglie 41462 (55063), the greatest living son of Besique (19602), heads our herd now. These horses must sell. **G. B. Loper & Sons, Chesterfield, Macoupin County, Ill.**

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

REGISTERED DRAFT STALLIONS AND MARES

for sale; mostly Percherons. Also road stallions, mares and colts at prices to suit your pocketbook and full value; can furnish most anything you want. **E. P. Hamilton & Sons, Garden Grove, Decatur County, Iowa. R. F. D. No. 2.** We are 23 miles southwest of Chariton and 24 miles southeast of Osceola. (Station, Leroy).

THREE DRAFT STALLIONS

for sale. 6 to 8 years old; 1850 to 2100 pounds; 2 Percherons and 1 Clydesdale; all registered. Good breeders, but their fillies are in their way.

Five Jacks for sale also; the big kind, 15½ to 16 hands; black with light points; yearling to 6 years old.

Five Hereford bulls—long yearlings and good.

J. R. Brooks, Cairo, Mo.

SHIRE AND PERCHERON
Stallions and Mares.

Imported long enough ago to be thoroughly acclimated and in thrifty condition. Good horses with quality at reasonable prices. Inspection invited. Will meet you at C. R. I. & P. or Interurban Ry., if notified. **H. P. Wilkinson Bros., Mitchellville, Iowa.**

Imported Shire Horse

for sale. Must dispose of him on account of his colts. Will guarantee him in every respect. **Ellis Shire Horse Co., W. J. Helms, Keeper, Ellis, Kas.**

DRAFT STALLION WANTED

In exchange for two pacers and one trotter. One is a black mare, record 2:16½ and now in foal to good trotting stallion. One is a bay 3-year-old mare, standard and registered, and nominated for the Horse Review Futurity Stake for trotters and pacers. One is a bay gelding 2 years old, extra good, highly bred and sound. For particulars address **D. V. Palmer, Lake Park, Dickinson County, Iowa.**

at present. At that time he owned a mare that was a fortune maker to any one. The list includes Mahaska, her colts and grand colts, the stallion, Dewey, was sold to father. Since that time Barnes has had two sales, one in 1909, in which he sold Mahaska for $245; three of her mares for $950; one three-year-old horse colt for $700; three granddaughters for $690.

BARGAIN, BARGAIN, BARGAIN.

BELGIAN, PERCHERON AND THOROUGHBRED STALLIONS

For Sale or Trade for Other Live Stock

Imported Belgian, coming 7 years old; chestnut, weight 2180; pure bred certificate No. A-4105; sure breeder; splendid colts to show.

Imported Percheron, coming 8 years old; black; weight 2060; pure bred certificate No. A-1284; a good breeder with lots of good colts to show.

Thoroughbred, fashionably bred chestnut stallion; sure as a goat; colts have size, style and exceptionally quiet dispositions. Pure bred certificate No. A-571.

Reason for selling—to dissolve partnership and quit the business.

A Quick Bargain for Someone.

ANDERSON & BICKNELL CO.
Lovington, Ill.

In his 1911 sale he sold three of her mares for $975; three granddaughters for $965; one grandson for $450; making a total of $6,275, added to the $4,250 he had already sold, $10,525, making a small fortune.

IDAHO QUESTIONS AND ANSWERS

To the American Breeder:—Here are five questions that come often in the correspondence of this station—with the answers we make given in each case:

1. Why is a horse trocared on the right flank for bloat and a cow on the left flank?

Answer—Because in the horse, the gas accumulates in the large bowel which lies on the right side. In the cow, the rumen or paunch is punctured and this lies on the left side.

2. What is the difference between glanders and "farcy"?

Answer—"Farcy" is the skin form of glanders, and is transmissible to man.

3. When a contagious disease breaks out on the ranch, what is the best thing to do?

Answer—Send for a competent veterinarian to diagnose the trouble, who will notify the state veterinarian. Immediately separate healthy from sick animals. Disinfect premises with a 10 per cent solution of formalin or a 5 per cent solution of crude carbolic acid in white wash.

4. Are pure bred stock more subject to disease than grades?

Answer—As a pure bred is naturally more valuable than a grade, the loss is more keenly felt in the region of the pocket book. On this account they sometimes are more coddled, kept in more artificial conditions, and are sometimes lacking in constitutional vigor.

5. If blackleg is suspected among calves how can the disease be eradicated?

Answer—Burn carcasses of dead animals; move cattle to new pasture; use blackleg vaccine. Write to veterinary department, University of Idaho, Moscow, Idaho, giving number of cattle to be vaccinated, and the vaccine, with full instructions, will be sent free of charge.—E. T. Baker, Veterinarian, Idaho Experiment Station.

TRUMANS'
CHAMPION STUD

The world's greatest collection of Shire Stallions and Mares, Percherons and Belgians to suit the most critical buyers; Hackneys of Richest Breeding and Strongest Individuality.

Fifth 1912 Importation of Shire and Percheron and Belgian Stallions arrived Oct. 29. Thirty-four years in the business and not one dissatisfied customer.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us.

Address for illustrated catalogue and other information, mentioning the American Breeder.

Trumans' Pioneer Stud Farm
Bushnell, Illinois

GALBRAITH'S CLYDESDALES

Are as familiar as a household word. Present stock includes first prize winners at all the leading state fairs. The only firm in the west owning an international champion. By far the oldest and largest Clydesdale importers in America. Address or call on.

ALEX GALBRAITH & SON :-: DE KALB, ILLINOIS

Formerly of Janesville, Wis.

FOR BREED PURITY AND BREEDERS' INTEGRITY.

To the American Breeder:—I am not a college man or theorist; my knowledge has been acquired by practice work and observation, connected with a wide range of travel and intercourse with progressive men. For forty years my main study has been the horse. In that length of time, I have acquired some knowledge that the average man or farmer could use to advantage, if it was put in practice by them. It has been said, and it is true, that a little knowledge is dangerous. Also that the American people like to be humbugged and the more they are humbugged the better they like it.

We have papers and papers that are printed in the interest of the farmer, at least are claimed to be, but alas, they utterly fail to meet his requirements. Why, just look them over, and you will see that they are filled with advertising of all classes with an iron clad warrant attached to all of them; grafters galore—gold bricks thrown in. Now in the past twenty years there has been a revival in horses and to some extent has bettered their condition, but there is still a vast amount of room for improvement in the same time. From the year 1898 to 1910 the horse men of this country lost their grip, farmers stopped breeding, markets slumped, the outlook to the average man was dark, but there were a few of the believers in the church that stuck to their faith in a small measure, but they were not among the leaders. The result in most cases: they have spent their means to keep the church alive and were forced to step down and out and see the inflow take their places—Uncle Sam among them.

Now we are launched on a new era, and a lot of the fakers are lost in the land with the pedigreed stallions, and some of them become attached to the best strains of blood of some family in a day, that are of no akin or never could be. Our laws prohibit it, but are not enforced. It

THIS STALLION FOR SALE

Gore's Denton 9567, by Gore's Best 6678 (19655), son of the double London winner, Soxton Tom (15871). 7 years old; sure breeder; colts to show. Young stallions for sale also.

J. E. McWHERTER,
BREEDER OF SHIRE HORSES
Plymouth, Hancock County, Ill.

GERMAN COACH STALLION

For sale or exchange; registered; black; 11 years old; weight 1450 lbs. An extra good breeder, but needs changing. **John M. Walker, Nineveh, Indiana. Route 2.**

is not the policy to enforce the law where wealth and influence are at stake. Honesty and integrity should be the motto hung up in every breeder's barn and over the register desk of every family of horses, and every stallion owner should refuse to give any mare out of the class she belongs simply to get patronage, and any farmer that has a well bred mare should see that she was bred to a like strain of blood if bred at all. He should be a self-thinker, one not to be misled into breeding a Shetland pony to a Percheron stallion. American farmers have today a lot of horses that are burdens to them; that is, so far as wealth is concerned, and until they sit up and open their eyes and educate themselves, they will continue to shovel their hard earned dollars into just such stock. The past week I spent on the road, looking for a pair of mares. In 200 miles travel, I found but one that was actually worth $100, yet I looked at a herd of them and the farmers wonder why they cannot sell. One man said to me in describing his mare: "That mare is out of my old mare and she was a good one. I bought her out of a carload that came from the west. Why I paid $60 for her and I paid $8.00 service fee to a man in Pennsylvania, don't recollect how his horse was bred, but he was a dandy, weighed 1,800 pounds." His old mare would not have weighed over 800. There you have a sample of the way breeding is done. All the rage is number of pounds, regardless of quality, conformation, color, or breeding. The stallioner is to blame for that and because he wants the patronage just for the dollar. I am a Morgan fancier, but I can see quality in any horse if it is there, and I see quality in the American Breeder that no other paper has at the present time, and I think that "A Square Deal to Patrons" must be hung above the editor's desk. —E. A. Rickard, Ashtabula County, Ohio.

WHY I BREED MORGANS.

To the American Breeder:—I see in your paper you are asking for some opinions on the horse. I have many times been asked why I breed Morgan horses. The reason is I have never found their equal in other breeds that meet with a ready market at all times. I never have to look for buyers, at prices that far exceed prices for other breeds, and they are in their prime at 20 years if taken care of. I admire a good horse and have no fault to find with the drafters; they are a useful horse in their place as well as other breeds, but Neighbor Breeder, be careful, the best will produce some inferior stock. The percentage of pure bred sires is a step for better in all breeds. Don't let a few dollars be the cause of using mongrels—that is a step backwards. D. Skinner, Meade County, Kas.

Let The Advertisers Tell It

Advertisement, $15.75; Total Sales, $12,800.

To the American Breeder: I have sold the entire property advertised with you for $12,800, to Mr. D. B. McCahan, Newman Grove, Neb. He will run the barn here for the coming season. He paid me for the house and barn, $4,500; for the jack, $800 and for the three stallions, $7,500. Please send bill for the amount owing you and stop the ad. (The amount was $15.75.—Editor).—Henry Dreher, Boone county, Neb.

Best Results From American Breeder.

To the American Breeder: From my ad of two stallions and two colts I had 30 answers. I have advertised before in different papers, but I got the best results from the American Breeder that I ever got. When I have any more stock to sell I will sure use your paper.—Wm. Hartman, Knox county, Mo.

Made a Sale On First Reply.

To the American Breeder: My advertisement sold my horse the first week, and to the first man who answered the ad. I received numerous inquiries, all of which I answered, telling them the horse was sold. The American Breeder is all right.—B. B. McEndarfer, DeKalb county, Ind.

Answers From Six States; Stock Sold.

To the American Breeder: My ad with you brought most satisfactory results. I received a great many answers, coming from six different states, and from Canada, and sold my stock. When I have more stock for sale, I shall not hesitate to advertise in the American Breeder.—F. R. Howard, Cass county, Ia.

One Ad Found a $1,000 Buyer.

To the American Breeder: I am going to send you my ad again this year. I sent it to you last year and the result was that I sold a Limestone Wonder jack for $1,000 cash, and only ran the ad three times. —Charles Wyatt, Pike county, Ind.

Every Ad Brought Him Business.

To the American Breeder: I have had definite results, which consumated in business, from every ad that I have placed in the American Breeder, and I have never had to run one the second time.—Chas. A. Galt, Linn county, Kas.

Twenty-five Replies and a Satisfactory Deal.

To the American Breeder: I received about 25 answers to my advertisement and made a satisfactory deal.—L. M. Laflin, Vernon county, Missouri.

Taking care of the soil is the first consideration in conservation of our resources.—United States Department of Agriculture Report.

LIVE STOCK PICTURES.

I make the best class of live stock photographs—suitable for making cuts or for framing. Drawings or paintings, if desired, but no cheap work. The leading live stock and farm papers of the country use my pictures. **H. L. Ritchie, Mt. Washington, Mo.**

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. **W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.**

FOR SALE OR EXCHANGE.

Kentucky Rex 1467; color bay; sired by Rex McDonald; dam, Maggie King by the famous old Forest King.

One imported Belgian; 12 years old; color bay; has weighed 2,210 pounds. This stallion is the surest draft stallion I ever saw. Has colts out of 1,100 mares that weigh 1,500 to 1,600; sired colts out of 1,400 mares that have weighed 1,870. This stallion has stood here six seasons; fillies in the way.

One Mammoth jack 14½ hands high; black, white points; quick server; extra breeder; lots of bone; length and body. I want a Belgian stallion and a good jack I can use on my jennets. Big, smooth; any color; want quality and breeding.

The above stock are all sure and good breeders. Will guarantee as represented. Books and colts to show. **O. T. Karr, Quitman, Nodaway County, Mo.**

BARHAM, SON & BUTLER

(The Home of Star McDonald 1712.)
At Milan, Tenn.

Will sell high class registered saddle horses, also a few large fine jacks at auction, March 19 and 20. Nearly all their consignments are from Kentucky, and the very best; many of them premium winners at Kentucky's best fairs. Write them for catalogue.

This firm keeps constantly on hand for sale at any time registered saddle horses and fine jacks. They have won more premiums than any stable in Tennessee on saddlers.

They are also large handlers of cow peas.

PURE BRED AND REGISTERED STALLIONS

for sale as follows:

One stallion foaled in 1906; grey, weight 1,900 pounds; a sure and good breeder. One stallion foaled in 1910; grey; weight 1,900. Never served mares. Three stallions foaled in 1911; grey; weight 1,500 to 1,600 pounds.

Also two stallions of the so-called Arabian. Both pure white; one foaled 1906; weight 1,350; 16 hands; a sure and good breeder. One foaled 1910; weight 1,125; 15¼ hands; untried.

For further particulars address **Wm. P. Newell, Washburn, Woodford County, Ill.**

HILLSDALE STOCK FARM

De Sota, Jefferson County, Mo.

We wish to announce that we have serviceable jacks from 14.1 to 14.3½ standard. Jacks that have weighed 1,150 priced from $450 to $1,100. Also such saddle horses as High Chief 2211, who has defeated second prize horse at World's Fair; 1,200 pound horse at $600. Colts, mares, fillies and jennets in foal; ones that produced jack colts this year. We can also sell jennets in car load lots.

Would exchange jack for registered Percheron stallion not over 10 years of age.

We guarantee to be as represented. Buy and sell on commission. Our knowledge, your gain.

Oscar Edwards & Son, De Sota, Mo.

KENTUCKY STALLIONS

For sale cheap; one 7 years old, 16.1 hands high, weight 1235, gentle for lady to drive, sure foal getter; colts to show; easy to handle.

One coming 3; 16 hands high. Both sound as a bullet. Reason for selling, want to quit the business; got more work than I can do. If you want a good one cheap, write to **Tom J. Hallmark, Curdsville, Daviess County, Ky.**

SADDLERS.

40 saddle stallions, mares, colts and fillies of the best Denmark and Chief breeding. Special prices on stallions for the next 30 days. **J. F. Cook, Lexington, Ky.**

FOR SALE OR TRADE.

French Coach stallion; 12 years old, and a 4 year old black jack. **E. Joy, Golden City, Barton County, Mo.**

SNAP FOR STOCKMEN

$5 to $7 per Acre

For McDonald county, Missouri, lands, practically all in native blue stem grass, 50 per cent subject to cultivation, fine running water, two to eight miles from Kansas City Southern Ry., and only 175 miles straight run to Kansas City market.

Cattle and hogs are being raised and laid down on the K. C. market at less cost and greater profit than at any other point in the southwest. Pasturage most all year 'round. Clover, alfalfa, corn, etc., make good crops. Ample rainfall. Most of land in native timber with fine grass.

BEST HOG COUNTRY IN THE WORLD.

Stock hogs come from this section because they are free from disease and it costs practically nothing to raise them.

K. C. Southern Ry. is making consistent gains in cattle shipments while most roads show loss. Great opportunity to buy now while you can still get bottom prices and stay close to big markets. Only a few hours' ride to big cities of Carthage, Springfield and Joplin.

Fine climate. No bad blizzards or hot winds. Ideal country to enjoy life and make money. This same land put in fruit is netting annually $100 to $150 an acre. Tracts of several hundred acres or more at $5 to $7 per acre. For particulars address **Wm. Nicholson, Immigration Agent,**
KANSAS CITY SOUTHERN RAILWAY,
671 Thayer Bldg., Kansas City, Mo.

RED RIVER VALLEY LANDS

For sale and exchange. For information write **J. J. W. Dvorak, Wyndmere, North Dakota.**

FOR SALE OR TRADE.

160 acres, black, sandy loam; all tillable; 90 acres in cultivation. Between Wichita and Rainy Mts., Kiowa County, Okla. Plenty good water; good fences; good house and barn and all necessary outbuildings. Full young bearing orchard and fruits; hedges; groves and alfalfa. $6,500 cash or payments, or will take part in stock. Address **Owner, Box 257, Waukomis, Okla.**

Land For Stallion

Wish to exchange a quarter section raw land; good soil; one-half mile from town, for a Percheron stallion; weight 1800 pounds or over; under nine years old. **Forrest Rice, Blaisdell, Montraille County, N. D.**

Must Sell---Sacrifice

160 Sumner County. Highly improved; close to town; 40 acres alfalfa; 60 pasture; excellent farm. Information LOCK BOX 285, WELLINGTON, KAS.

Land For Stallion

or cash. Smooth 160 acres Western Kansas land, worth $3,000 and good city residence worth $1,600; town of 4,000. Will sell either property and take good Shire stallion as part pay. Address, **Box 327, Dighton, Kas.**

March 6—S. J. Miller, Kirksville, Mo.
March 12—J. E. Clary, Sheridan, Mo.

A big public sale of imported and home bred Percherons is billed by C. W. Lamer & Co., Salina, Kas., for March 13. The offering is remarkable for the large number of imported three year old stallions it contains—stallions ranging from 1800 to 2100 pounds and with heavy bone and substance in proportion. In addition to the imported stallions there is a large number of home bred stallions and a fine line of registered mares. Lamer & Co. will also sell 100 head of grade farm mares and good work stock. This will be one of the biggest vendues of horse flesh ever held in Kansas. Send at once for a catalogue, mentioning the American Breeder. Address C. W. Lamer & Co., Salina, Kas.

On March 6 the purebred horse breeders of Mitchell County, Kas., will hold a public sale at Beloit. Forty-five head of stallions and mares will be sold, including thirty-six registered Percherons, balance other draft breeds or Standard bred. For catalogue address (mentioning the American Breeder) M. A. Smith, Cawker City, Kas. See ad in this paper.

Have you noticed the bargains offered by G. W. Weaver, Harrisonville, Mo., who is quitting the breeding business? Read his ad.

If you want to read a mighty instructive book on conserving the most important and at the same time most severely tried point of resistance in a horse, write the National Nailless Horseshoe Company, Philadelphia, Pa. There is much more in this book than an advertisement; it is full of ideas and instructions, and to many a man it will mean the preservation of a horse's greatest asset and the restoration to usefulness of many a horse which otherwise would be out of service for good. Mention the American Breeder when answering this company's advertisement.

Rhea Bros. of Arlington, Neb., are pioneers in the idea of selling acclimated Percherons to their customers, and the carrying out of this idea has been one of the most important factors in their success. It is one of the first requisites of a stallion if it is to pay a profit to its owner that it be acclimated. This firm has other strong claims on the patronage of those in available territory which are set forth in the advertisement of Rhea Bros. in this issue.

Lack of business training is the greatest difficulty encountered in business. Men with brains, energy and capital find that they must learn through expensive experience many things which a thorough business training would have given them beforehand. One of the best means for avoiding this great difficulty is now offered by the Ransomerian School of Penmanship, 309 Minor Bldg., Kansas City, Mo. Address C. W. Ransom, President, for further information. You will find his advertisement in this issue.

The greatest car in the thousand dollar class today is Reo the 5th, the 1913 machine put out by R. M. Owen & Co., sales agents for the Reo Motor Car Company. Here is a car high class in every respect which has set the price competition of cheap cars, the service competition of medium low priced cars and appearance competition of the best lookers going. We hope every reader in position to make use of a good automobile will answer our regular advertisement from R. M. Owen & Co., Lansing, Mich., asking for catalogue and mentioning the American Breeder.

The New Hudson 37, the automobile which the Hudson Motor Car Company is advertising regularly in the American Breeder, is seen with increasing frequency on country roads as well as city streets all over this country. There is probably no car more universally tested or universally liked now before the American people. This car is especially built to meet a demand for cars with more service than the popular light weight touring car which had been in use, and less expensive than the really high class machines formerly have been. That it is meeting that demand is shown by its growing popularity.

C. E. Brooks, 1007 State Street, Marshall, Mich., has a page advertisement on the back cover of this issue. It is of supreme importance to many families in recommendation of this advertiser's appliance—appliance for the cure of rupture. Nothing more need be said than that they are bought and used by the United States War Department.

One of the season's most important sales will be held at Blue Mound, Kas., March 6. This is a sale of Belgian and Percheron stallions and mares and jacks and jennets. Included in the offering is probably the best collection of imported stallions west of the Mississippi today, as this firm, W. H. Bayless-Dero & Co., have special facilities in the way of European connections for getting the best there is going in Belgians. The sale is being made on too short notice, this being the very first announcement of it, and the probabilities are that buyers will secure excellent bargains because of this fact. Catalogues of this offering are ready now and everyone in position to use a good Percheron or Belgian stallion or mare or a jack or jennet providing he can get it at a bargain, should send at once for a catalogue and mention the American Breeder.

Notice the advertisement of Barham, Son & Butler, Milan, Tenn., breeders and dealers in high class saddle horses, and dealers in jacks. This firm also makes a specialty of selling its customers the best seed obtainable for cow peas.

Read the ad of O. T. Karr, Quitman, Mo., which appears in this issue and see if he isn't advertising some stock that you would be interested in.

S. B. Clark of Nesbit, N. D., has interesting land and jack ads in this issue. Don't fail to read them.

Ernest Shoebotham of Fairbury, Neb., has four jennets and two jacks that he will sell at a bargain as he is going to change locations and don't care to move them.

Hogan & Stover of Greenleaf, Kas., have a large Kentucky jack that they would like to exchange for a registered Belgian stallion. If you are interested be sure to write them.

Every man or boy who has problems in horse training and handling to master will be interested in the advertising of Prof. Jesse Beery which we publish. Address him at Box 712 Pleasant Hill, O., about his special free offer.

Read Geo. S. Brown's ad in this issue. He is closing out his breeding stock. His address is Ethlyn, Mo.

A percheron stallion and a six year old jack are advertised for sale in this issue very cheap by L. N. Thompson, Cowden, Ill.

Read the advertisement of G. A. Tallmadge, Madison, So. Dak. He has three shire stallions for sale.

L. D. Norris of Redding, Ia., wants a Coach stallion and would like to exchange his saddle stallion for one. His ad is in this issue.

Don't fail to read the advertisement

LOOK HERE.

How Would This Jack Suit You?

7 years old; weighs 1050; a quick server; colts to show; won first at state fair 1910 and 1911. Is black with white points.

I also have a good black 2-year-old jack 60 inches high and two good jennets—5 and 1 year. Am quitting the business and will sell them right. **J. W. Gillum, Wing, Ark.**

Jack and Farms

For sale. One extra good jack, two years old last October. Can be registered; black, light points; the best I ever saw for his age. Have also six or eight farms for sale at $20 to $25 per acre; well worth the money. **Lars Bartelson, Badger, Holt County, Neb.**

Two Registered Jacks

Coming 3 and 4 years old; 15 and 15½ hands standard. Good workers and guaranteed breeders. Priced cheaper than you can buy elsewhere. My own raising. I need the money. Don't need the jacks. No trades. **J. A. Stormont, Dighton, Lane County, Kas.**

JACK FOR SALE OR TRADE.

Will take registered Percheron stallion in trade for good black jack.

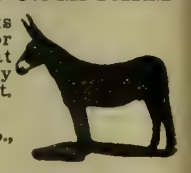
For sale also, 640 acres of land—300 cultivated. **S. B. Clark, Nesbit, N. D.**

GRANDVIEW JACK FARM.

50 head of black Mammoth jacks and jennets for sale, from 1 to 7 years old. In the offering will be my herd jack, Monster, 16½ hands; very heavy bone and body. This jack is good enough to head anybody's herd of jennets. Would not offer him but his colts are old enough to breed. Would exchange for one as good.

Also one imported Belgian stallion and one registered black Percheron. **C. McNulty, Stockton, Rooks Co., Kas.**

JACKS AND PERCHERON STALLIONS



Best lot of jacks ever offered at Quiet Glenn; the big kind with herd headers among them a specialty. Buy this fall, get choice and save money. — G. M. SCOTT, Rea, Andrew County, Mo.

10 MISSOURI BRED JACKS

Sucklings to five years old; black with white points. The good kind. Nine jennets of the right type; two years old and up. All jennets of breeding age with foal. Correspondence solicited. Visitors welcome. **Guy W. Fisher, Frankford, Pike County, Mo.**

REPUBLIC COUNTY JACK FARM

Three good jacks coming 3 years old, for sale, including two that are extra good. Will pay car fare if they are not.
T. E. Collins & Son, Belleville, Republic Co., Kansas.

A $1,000 JACK TO TRADE

A big, full made black jack with white points; 15 hands standard; six years old, for two good young draft mares in foal. Clydesdale preferred. Tell it all in first letter. **Enos Hayes, Elizabethtown, Hamilton County, Ohio.**

EXTRA GOOD HERD JACK

for sale; seven years old; weighs 1125 pounds; serves well on mares and jennets. Also two year old jacks and jennets as large as they grow anywhere. I guarantee them to be right. Come and see them. **Henry Obermann, Freistatt, Lawrence County, Mo.**

JACKS FOR SALE.

26 fine large Tennessee jacks; 6 months to 7 years old. Also 24 jennets bred to fine jacks. Prices right. Catalog free if you mention the American Breeder. **S. W. Jetton & Co., Murfreesboro, Tenn.**

Lake View Stock Farm

For sale, 15 jacks as good as any one has, from six months to five years old and from 14 to 16 hands high. I can sell them for less than any one. Write for particulars or come and see them. **T. H. Early, Centralia, Boone County, Mo.**

KENTUCKY JACK FARM.

Established in 1884.

A fine lot of black mammoth Kentucky jacks; big bone and plenty of weight. Will sell in carload lots for the next 30 days, at special prices. **Joe E. Wright, Prop., Junction City, Ky.**

Page Avenue Jack and Jennet Farm.

Three good herd jacks for sale; weight about 1,000; plenty of bone and frame; first class breeders and good ages. Also young ones for sale from colts to two year olds. Two of these jacks are half brothers to Missouri Wonder, sired by Silver Dick Bland. **J. R. Reynolds & Son, Guthrie, Callaway County, Mo.**

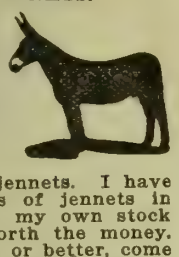
Two Good Jacks

For sale. One 16 hands high. 7 years old. The other jack is 5 years old and 14 hands high. Price reasonable. Colts in the country to show their breeding. Address **Wm. H. Knox, Bowling Green, Clay County, Ind.**

Good Jacks

A few very desirable ones for sale; two to seven years old; good height, bone and color.

G. H. MINTON,



Forest City, Holt County, Mo.

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. **Scott, Abney & Jenkins, Virden, Macoupin County, Ill.**

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. I raise all my own stock and will sell them worth the money. Write for prices today, or better, come and see them. **U. G. Saunders, Flemingsburg, Ky.**

Headquarters for

Mo., Ky., and Tenn. Jacks

Sold singly or in carload lots. I guarantee more bone and more good Jacks and jennets than any breeder or dealer in Missouri. Every one black and from 15 to 16 hands high. Have them of all ages. Thirty-five years doing business with the public, and never had a lawsuit with a customer.

ED. BOEN, LAWSON, MO.
(Lawson is 28 miles from Kansas City.)

SIX JACK COLTS

For sale. Also two Percheron stallions and five Standard bred stallions. 640 acres devoted to live stock. 22 miles from Kansas City and 28 steam and electric cars each way daily. Make appointment with me by phone or mail.

F. M. Lorimer, Olathe, Kas.

THREE JACKS FOR SALE.

One registered jack, 16 hands high; black with white points; extra heavy bone; good feet; good head and ears; foaled June 16, 1908. One brown jack; 15 hands high; heavy bone and body; good head and ear; foaled Sept. 4, 1909. One black jack; 15.3 hands high; extra good breeder—jennet jack—foaled in 1903. Will sell cheap or exchange for draft stallion. **W. W. Downing, Hawk Point, Lincoln County, Mo.**

OAKWOOD FARM.

The home of imported Taxpayer (for which I paid $3,250 at auction).

20 Jacks, Imported and Native.

Two to six years old; 14½ to 16 hands with lots of bone, substance and quality. Have some attractive offerings in young jacks, and jennets with foal; descendants of imported Taxpayer. All stock registered and warranted. **Allen B. Harlan, Columbia, Tenn.**

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. HUCKSTEP,
Eolia, Pike County, Mo.

AUCTIONEERS

MAKE BIG MONEY.

There's a School THAT SHOWS YOU HOW.

Next Term Opens August 4 and Lasts Four Weeks.

THIS IS THE BIG TERM FOR ACTUAL PRACTICE IN SALES.

Tuition remains the same, $50 down and 25 per cent of the first $200 you make out of auctioneering.

MISSOURI AUCTION SCHOOL

(Largest in the World.)

W. B. CARPENTER, President. Horse and Mule Auctioneer, 14th & Grand Ave., Kansas City, Mo.

Ten Jacks

one to six years old for sale. Must be seen to be appreciated.

HAMPTON BROS., WINCHESTER, CLARK CO., KY.

in this issue of C. Michel, Leslie, Mo., and if you are interested write him for full information.

Read what Lars Bartelson of Badger, Neb., has to sell. He would be pleased to hear from any one interested.

Chas. McNickle of Deshler, Ohio, is offering his Percheron stallion, Prince 11459, for sale cheap in order to dispose of him at once. Read the ad.

John H. Chambers of Edinburg, Ind., is advertising four Clydesdale and one Percheron stallion for sale in this issue.

Don't fail to write Firkins & Park of Cameron, Mo., if you are in the market for stallions or jacks. They have a large bunch to select from and no doubt could please you.

Fisher & Walker, the well known importers of Percherons, at Evansville, Ind., invite all our readers to inspect their stock before buying. Their ad can be found in these columns.

J. P. & H. M. Malone of Chase, Kas., are advertising a nice lot of Percheron stallions, jacks and jennets regularly in this paper. If you are in the market don't fail to write them.

If you are on the lookout for a Percheron, Belgian or Shire stallion or mare, don't fail to look up the advertisement of North & Robinson, Grand Island, Neb. They will send any of our readers who are interested a large horse calendar.

D. Teinert of York, Neb., has five stallions advertised for sale. He is compelled to change blood. Look for the ad.

It would undoubtedly pay anyone in the market for Percheron or Belgian stallions or mares to write to J. R. Justice, Galesburg, Ill. You can find his ad regularly in our columns.

Prize winning stock in the way of Percheron, Shire or Beligian stallions is offered for sale by the Percheron Importing Company, South St. Joseph, Mo. Don't fail to inspect their stock if you are in the market.

Write to S. Metz & Sons of Homewood, Ill., if you are in the market for a Percheron, Belgian or Shire stallion or mare. They would be pleased to tell you about their stock.

W. H. Richards of Emporia, Kas., has a nice lot of Percherons and Belgians of his own selection that he is offering very cheap, considering the quality. His ad appears regularly in this paper.

If you are in the market for a Percheron, Belgian or Coach stallion or mare, Ives & Bellman of Delavan, Wis., have 100 head that they would be glad to have you inspect.

Peter Hopley & Son of Atlantic and Lewis, Iowa, importers of Percherons and Shires, invites inspection of their stock at any and all times. They have been making from one to three importations a year since 1884 and have some of the best stallions and mares they could find in France and Great Britain. They are regular advertisers.

Look for J. M. Nolan's ad in these columns and if you are in the market for a draft or coach stallion, don't fail to write him. He lives at Paola, Kas.

D. Augstin, Prop. of White Oak Stock Farm at Carlock, Ill., always has a large number of Percheron stallions and mares on hand to select from. Write him for prices and description if in the market.

The well known firm of H. Knoche & Sons of Onarga, Ill., have a number of fillies and stud colts sired by Gouveneur that they are offering for sale. Look up their ad.

Deer Park Breeding Stables, owned by Sappington & Brockman, Centralia, Mo., have stallions, jacks and jennets for sale. They are going to close out and will sell this stock at bargain prices. Don't miss writing them.

Wright Bros., of Mt. Pleasant, Iowa, hold their annual sale of breeding stock on March 4th. Look up their ad, it tells what their offering consists of. If you are interested it might pay you to write for further particulars.

H. Schofield of Worthington, Minn., has bought the entire flock of Shropshire sheep, formerly owned by G. W. Patterson. He has more than he needs and wishes to dispose of one or two carloads. If you are in the market for stock of this kind, no doubt it would pay you to investigate his stock.

If you are in the market for breeding stock, read the ad in this issue of H. B. Higgason, Flora, Ill.

W. A. DeMerritt, the well known breeder of Clydesdale horses at Plainfield, Ill., starts his ad in this issue. He has stallions and mares of all ages. He also has a nice herd of Shorthorn cattle. Look for the ad.

The manufacturers of "Spohns" (advertised in this issue), write that "The original formula of Spohn's Distemper and Cough Cure was for a number of

JACKS AND STALLIONS.

Forty-five of the best Mammoth jacks in Kentucky from $300 to $1,000. Registered Percheron stallions from $250 to $750. Write for circular or visit the Cloverdale Farm. **H. T. Brown & Co., Lexington, Ky.**

years in certain eastern countries considered the most efficacious remedy for those dreadful, insidious diseases, diphtheria and scarlet fever, and is from the prescription of Mr. Von Baronhoffe. German veterinarians first publicly tested the compound after the original formula in cases of infectious catarrhal pneumonia. The relief was instant and the cure was speedy and permanent, and was brought to the notice of the government, and was afterward introduced into the United States

Oltmann Bros., Watseka, Ill., have an advertisement regularly in our columns. They are importers and breeders of Percherons, Belgians and German Coach horses.

Sauer Bros. of Sanborn, N. D., have an imported Belgian for sale or they will exchange for another stallion. Read their ad.

David Cooper & Sons of Freeport, Kas., say they have the classiest bunch of imported and home bred stallions and mares they have ever offered. Anyone in the market will do well to investigate this stock.

Imported Belgian and Percheron stallions are offered for sale at all times by C. W. Babcock, Walford, Ia. See his ad.

D. V. Palmer, Lake Park, Ia., has two pacers and one trotter that he would like to exchange for a Percheron stallion. Read the ad in this issue.

If you are in the market for a Percheron stallion or mare, look up the advertisement in this issue of Peter Lautzenheiser, Maximo, O.

Ed Boen of Lawson, Mo., writes: "I have more big black jacks than I ever owned before and will show you more big 15½ to 16 hand three year olds than any man in the country. Fifty big jacks and jennets—every one a black Mammoth. I never handle any but the good ones; over half of my jacks are good enough to head any bunch of jennets and I have never spared time nor money in selecting the best to start with. I have one of the best bunches of jennets in the United States. Last spring I sold seven jack colts out of this bunch of jennets to one man in Colorado for $800 apiece. I never had a law suit. Have sold thousands of them. Sold 50 last spring, 20 going to Colorado. I will treat you right; give you the best I have to eat and sell you anything I have on the farm. I am responsible for any deal you make, no matter how big."

G. A. Ford, manager Ford Stock Farm, Parker, S. D., writes: "During the week ending the month of January we had the pleasure of selling J. M. Trecker, Salem, S. D., an imported black Percheron; John Lechner, Leola, S. D., two imported Percherons, gray and black; C. E. Wiley, Carthage, S. D., an imported Belgian; Percy Bump, Montrose, S. D., an imported black Percheron; John Reimer, Zeeland, N. D., an American bred black Percheron; F. F. Tiesen, Freeman, S. D., an imported chestnut sorrel Belgian; Jacob Unruh, Parker, S. D., imported dark gray Percheron, and sale of 5 head to party in Montana, not yet delivered."

J. G. Truman, manager Truman's Pioneer Stud Farm of Bushnell, Ill., writes: "Inquiries for strictly high class Shire, Percheron and Belgian stallions still continue good. Among the sales made by us last month not previously reported are the following: Shire stallion to Lawrence Balk, Carroll County, Ia.; Percheron stallion to Rutgert Peters, Calhoun County, Ill.; Belgian stallion, William J. McDonald, Bureau County, Ill.; Shire stallion, Andrew Backlund, Spokane County, Wash.; Percheron stallion, B. F. Allender, Page County, Ia.; Percheron stallion, Warren Cupp, Iroquois County, Ill.; Shire stallion, Montgomery & McLeod, Benton County, Ia.; Percheron stallion, B. H. Dennis, Keokuk County, Ia.; Shire stallion, E. E. Cooper, Keokuk County, Ia.; Percheron stallion, John White, Keokuk County, Ia.; Shire stallion, J. T. Price, Clinton County, Ind.; Shire stallion, Murray & Spindler, Ida County, Ia. This is the third Shire stallion we have sold these gentlemen.

Fifty (50) head registered Percherons, all in Percheron Society of America. Robison & Brown sale of Percherons at Kansas City Stock Yards, Wednesday, March 5, 1913. This is a dispersion of the entire stud of W. R. Brown of Minneapolis, Kas., and in this consignment will be some of the best brood mares that ever went through a sale ring, both imported and American bred. They will weigh up to twenty-two hundred (2200) pounds and every mare in the sale old enough to breed is showing heavy in foal. They are ready to start right off to making money, all are excellent workers and they are bred to one of the very best young stallions in Kansas. Among the young things are several show prospects. J. C. Robison of Towanda, Kas., is consigning thirty (30) head of the best young stallions and mares that ever left White Water Falls Stock Farm. Some stallions and fillies sired by the great World's Fair Champion stallion Casino

Geo. W. Souers & Sons of Huntington, Ind., write: "Our January business has been a record breaker, and the outlook for February is very encouraging. Those interested in securing a good stallion should see us before making their final decision. We have some extra good ones and can suit the most particular judges. About seventy-five head of imported and American bred stallions to pick from, thus enabling us to satisfy all. These stallions are in the pink of condition, are thoroughly acclimated and ready to enter active stud service. Two year olds,

LaFAYETTE STOCK FARM

HIGGINSVILLE, MO.

Mammoth Jacks & Percheron Stallions

20 Jennets in foal to my champion jack, Dr. McCord.

ALL FOR SALE PRIVATELY—NO SALE THIS SPRING. Visit or Write.

W. J. Finley, Higginsville, Mo.

55 Miles East of Kansas City on C. & A. R. R.

I AM CLOSING OUT on account of my health and age.

Here are the Bargains:

One imported dapple gray Percheron stallion, weight 1985 pounds; foaled in 1903; good and sure breeder and easily handled; colts to show. His registration numbers are (59513) 57977.

3 good young jacks, all Mammoth bred; black, with white points; all broke and quick servers. One is 3 years; 16½ hands, standard; weight 1165; very lengthy; 9½ inch bone; 16 inch foot; 36 inch head; 35 inch ear; a herd header. One is coming 3 years; 15½ hands, 9½ inch bone and will make a good herd jack. The other (same age) is very heavy; broad backed, wide out and square, with a 10 inch bone in front and 12 inch behind; 14¾ hands.

6 good jennets; 1 to 8 years old; 14 to 15½ hands; all bred that are old enough.

Would take good cattle or mules on a trade.

G. B. WEAVER, ROUTE 1, HARRISONVILLE, MO.

(35 Miles Southeast of Kansas City.)

OUT OF SEASON PRICE

on 14 jacks and jennets from two to eight years old. In this offering will be my herd jack, Klondike; he is a good one; would not offer him only I must change jacks; have some of his colts old enough to breed. **Geo. T. Ponge, Garrison, Christian County, Mo.**

BARGAIN IN A YOUNG JACK.

26 months old; 13½ hands standard measure. A good jack and guaranteed all right. Price low for the kind. **Nick Wagoner, Menlo, Thomas County, Kas.**

three year olds and four year olds of all colors. No better lot of stallions have ever been in our barns and they will be sold upon a very small margin to make room for another importation. Now is the chance to get something good at a low figure."

Wolf Bros. of Albion, Neb., write: "We beg to say that our horses are in pink of condition and business is opening up in good shape. We have sold in the past ten days a black two year old Percheron stallion to Mr. Dean of Pierce, Neb., a bay Belgian stallion to Mr. Volk of McLean, Neb., a gray four year old Percheron stallion to Mr. Foster of Aldine, Neb., a black Percheron stallion to Mr. Dauthit of Wayne, Neb., a sorrel Belgian stallion to the Odebolt Belgian Horse Company of Odebolt, Ia. We also sold to Mayer Bros. of Uniontown, Wash., a Belgian and a Percheron mare. We have decided to sell every one of our prize winning stallions and mares, 22 in all, a grand lot of individuals, at prices that can not be duplicated, quality taken into consideration. They all have quality, draftyness and weight and will appeal to anyone who really is looking for high class breeding stock. We will be glad to send to anyone interested, free photos from life upon application."

Henry Heibner of Danville, Ia., is advertising jacks for sale or will exchange for Percheron mares. Read the ad in this issue.

Ellis Shire Horse Company, W. J. Helms, keeper, Ellis, Kas., has an imported Shire horse advertised in this issue. He is compelled to dispose of him on account of his colts. Look up the ad.

D. B. Jenkins of Jewell, Kas., is offering his imported Percheron stallion for sale for $800. Look up the ad in this issue.

Look for the advertisement in this issue of Wm. P. Newell, Washburn, Ill. He is advertising some pure bred, registered stallions. If you are interested he will be glad to give full particulars.

Tom J. Hallmark, Curdsville, Ky., is advertising Kentucky stallions for sale cheap in this issue. Look up the ad. It gives a good description of the stock he is offering.

Three Percheron stud colts are advertised in this issue by J. G. Richards, Struthers, Ohio. If interested, look up the advertisement and write him.

A big black jack is offered for sale in this issue by P. P. Maddox, Keystone, Neb. Look for the ad.

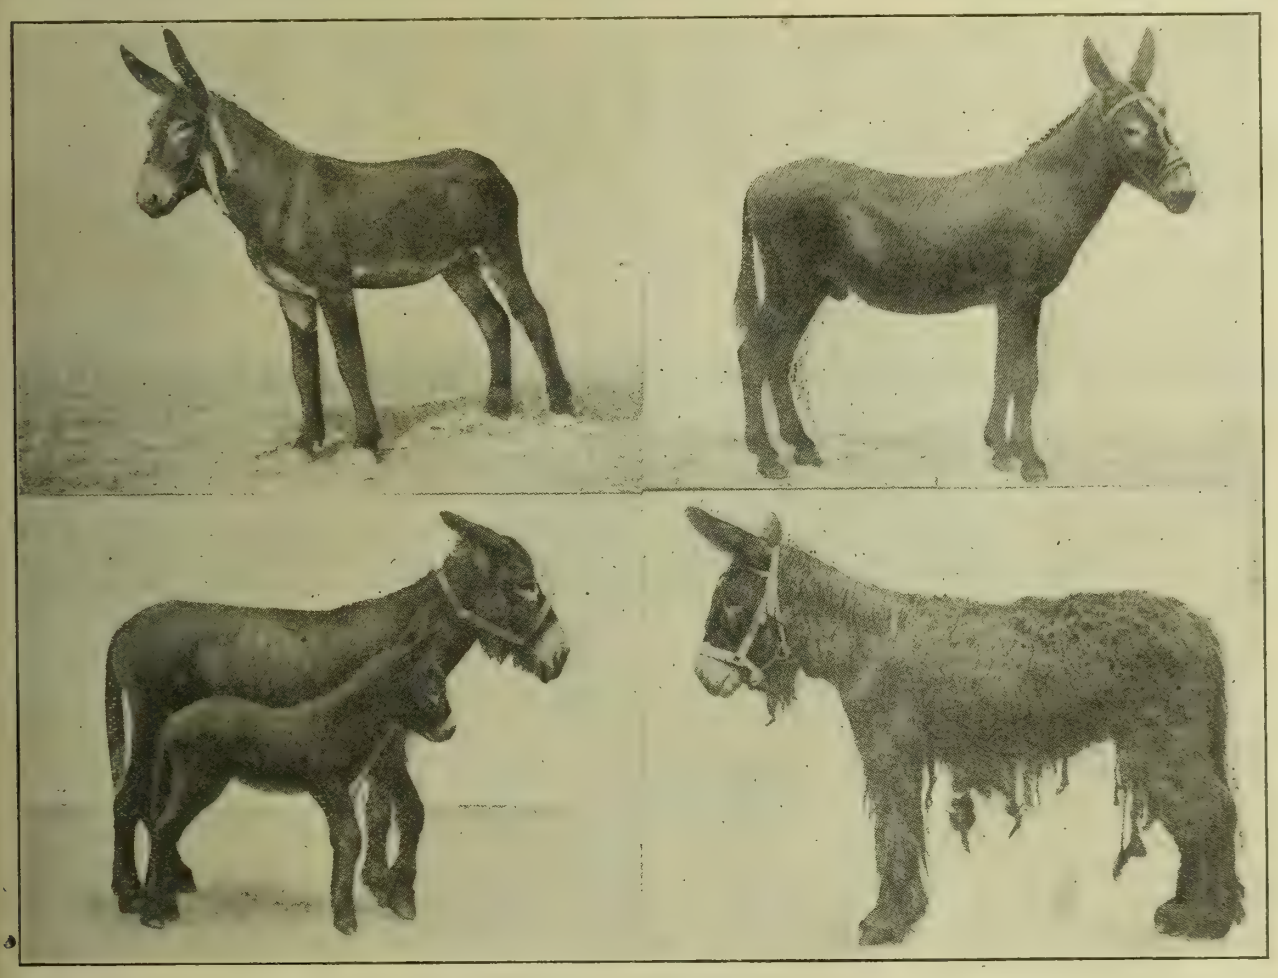
Forrest Rice of Blaisdell, N. D., wants to exchange a quarter section of land for a Percheron stallion. Read what he says in the ad, which appears in this issue and then write for full particulars.

If you are in the market for a jack or jennet, look up the ad in this issue of John Henry, Fairfax, Ia. He has them from $250 up.



A Mammeth jack is advertised for sale in this issue by D. H. Bibens, Larned, Kas. If in the market, write him.

Look up the advertisement in this issue of L. J. McIntosh, Burns, Kas. He has a black jack for sale.

Can you imagine an event more important in the jack and jennet business than the thirty-fifth public sale from the most famous herd of jacks and jennets in America? That is exactly what is being advertised in this issue by L. M. Monsees & Sons of Smithton, Mo., and if any other assurance is needed as to its importance, just read the guarantee of Mr. Monsees himself as printed in the advertisement. What this firm has achieved in breeding, showing and selling jacks and jennets constitute important chapters in the live stock history of this country, and part of it forms some of the most remarkable pages on the records of national and international live stock shows. For full information on this particular offering which will be sold March 4 at Limestone Valley Farm, address L. M. Monsees & Sons, Smithton, Mo., and mention the American Breeder.

M. P. Lydon of Cresco, Ia., has a French draft stallion advertised in this issue. Will sell him cheap for cash or will exchange for a good Belgian or Shire.

W. H. Fulcomer, proprietor of the Excelsior Shetland Pony Farm at Belleville, Kas., would be pleased to hear from any of our readers who are in the market for a registered Shetland.

TYPES OF JACK STOCK.
Upper Left, American Jack; Upper Right, Italian Jack; Lower Left, Spanish Jennet and Colt; Right, French or Poitou Jack.

WHO CAN ADVISE HIM?

To the American Breeder: I would like to have your advice about getting a position by placing an ad in the American Breeder. I am a young, single man and own a farm here, but I get tired of batching and I am going to let a man run the place this year and I will hike out for a while. I have done nearly all kinds of farm work and have used horses all my life and owned some good grades; have taken care of stallions and jacks out of season and last year I traveled a fine pure bred draft stallion with good success and have done some artificial

Strictly Good Jacks

Five head—coming 4 and 5 years old; 15.1 to 15.3 hands high standard, and very heavy bodied; 9 inch bone; good feet, heads and ears. One jack is iron gray; others black with white points. All well broke to mares, and three suitable to head highest class jennet herds. Colts to show from the older jacks. For prices phone, write or see, **O. J. Rhoades & Son, Lees Summit, Mo.**

Write for catalogue, mentioning the American Breeder, and come to this Great Sale.

L. M. Monsees & Sons - - Smithton, Mo.

AUCTIONEERS—R. L. Harriman, Jas. W. Sparks, C. J. and Kemp Hieronymus, J. Zack Wells, John D. Snyder, John Logsden, Ed Ringen.
CLERK OF SALE—Frank Monroe, Sedalia, Mo. Terms, cash.

breeding but never fixed any horses for showing. I have lived on an isolated ranch alone for days at a time and have done quite a lot of work in the saddle. What I want is to get a job with draft horses or jacks and would prefer to tend more stock and be at one place all the time. Would not object to camping on a ranch with a man or two, or alone or going on the road; plenty of reference and no "booze" or tobacco.—Bob Fields, Yamhill County, Ore.

ANOTHER BIG JACK.

To the American Breeder: I saw an item in your paper of January, 1913, in regard to a large jack, owned by Mr. D. H. Sprague of Clark Co., Ohio, in which you ask if any readers of the American Breeder has his equal. I have a Mammoth black jack foaled in 1907. He is coal black with light nose; 15½ hands standard; heart girth, 73 inches; flank girth, 74 inches; arm measure, 23 inches; knee measure, 16 inches; smallest below knee, 8¾ inches. He weighed 1,000 pounds at two years old. I have not weighed him since.—I. L. Crockett, Clay County, Ark.

NO "BUZZARD BAIT" HERE.

To the American Breeder: I have noticed several inquiries lately in your paper about the big jacks of last year; namely, Mr. R. Beager of Tennessee, and Mr. W. F. Bernett of Illinois. I said last year I thought I had the largest yearling in Missouri. I think now we have the largest and best two-year-old in the state. He is 16 hands standard; 70 inches heart girth; 9½ below knee; 20 inches hock; black with white points. The black is good black and white is very white and doesn't look as though the buzzards would ever get a job from him. These measurements are correct and any doubting Thomas can come and see for himself.—Dillingham & Dewitt, Jackson County, Mo.

SLOW JACKS.

To the American Breeder: I have three jacks and one is slow, unless he gets a smell of a jenny and then he is quick as a horse. The way I do is take a sponge and a piece of small hose and run the hose in and draw the urine and throw the sponge in his stall for two minutes and take him out to the mare and he will serve as quick as a horse.—Perry Simmons, Story County, Iowa.

GETTING PAY FOR COLTS.

To the American Breeder:—In regard to the colt question, if a man sells a mare and colt and doesn't say anything about the colt not being paid for, can they take the colt? If so, can't they handle the man for getting money under false pretense? If we can't, our law is no good, if we can't catch the rascals. The honest men don't need any law, they will pay anyway. I think we ought to have a law where we had a lien on the mare so they couldn't trade them off.

I know of one case where a man traded for a mare and promised to pay for the colt if she had one. Then he traded her off in a short time and told the man she wasn't in foal, and would never pay part of it. Some say to go on to the man that bred her; suppose he isn't worth it, then what?

We had a law passed on us requiring a sound horse. If he goes wrong, we have lost the worth of our horse. I think we need some protection. Some say to get your money at time of service. There are lots of men that wouldn't take the chance of losing their money. After the mare owner gets a colt he feels more like giving the money up. C. W. Bord, Warren County, Ill.

JACKS, JENNETS AND DRAFT HORSES AT

PUBLIC SALE MARCH 12

20 Jacks and Jennets—All blacks with light points, the jacks 1 to 4 years old and the jennets 4 to 8 years. This is a desirable class of stock, all blocky, heavy boned, and the jennets all bred to the famous herd jack, Ben Hur, a 1,200-pound, 16-hand jack.

10 Draft and Road Horses, including breeding stock and matched pairs of work animals.

8 Good Mules, all broke; some matched pairs.

Send for catalog and any information desired, and mention the American Breeder.

J. E. CLARY & SONS :-: :-: SHERIDAN, MO.

R. L. Harriman, Auctioneer.

Sheridan is on the Chicago Great Western Ry., 55 miles north of St. Joseph, Mo.

SAVED HUNDREDS OF MILES OF TRAVEL FOR $2.80.

To the American Breeder: The little ad I put in your paper enabled me to buy a fine Kentucky jack. I received over 100 letters from jack men and still getting them. I think the American Breeder the best paper in the world for stockmen.—G. L. Epperson, Llano County, Texas.

TWO MAMMOTH JACKS.

Four and eight years; weight, 950 and 980; 15 and 15½ hands jack measure; girth measure 68 inches. Big ears and feet; heavy bone; black, mealy points; good performers; show good colts. Price $600 and $800 cash. Sell separately.

IMPORTED PERCHERON.

Black; eight years old; weight 1900; girth measure 83 inches; sound; a sure foal getter. Colts to show. A good pedigree. Price $900. **W. K. Shaw, Garnett, Kans.**

Egg Contest Now International

White Leghorns From England in Lead—Silver Wyandottes and White Wyandottes Follow. A Feeding Test of Great Value. Advantage of Early Hatched Pullets.

The second National Egg Laying Contest at Mountain Grove, Mo., is proving much more satisfactory, in every particular, than the first contest. While many birds are not yet mature, yet every pen had laid some eggs before the close of the first month. The total for the first six weeks is 5,254 eggs. The English pen of S. C. White Leghorns, No. 2, leads with 263 eggs. Silver Wyandottes, pen No. 23, is second with 217 eggs. White Wyandottes, pen 28, are third with 185 eggs. The yield for the first few weeks was not equal to that of last year because the birds are practically all pullets this year, and large numbers of them are not mature, but last year large numbers of them were hens and laid early in the contest and fell off later. The yield has increased rapidly each week and we are now getting a 33 1-3 per cent egg yield from the entire flock, and still gradually increasing.

The ten leading pens for December yielded as follows:

No. 2, S. C. White Leghorns, 222 eggs; No. 43, S. C. Reds, 162 eggs; No. 23, Silver Wyandottes, 157 eggs; No. 28, White Wyandottes, 151 eggs; No. 60, White Orpingtons, 136 eggs; No. 33, Barred Plymouth Rocks, 135 eggs; No. 20, White Wyandottes, 133 eggs; No. 59, Black Orpingtons, 133 eggs; No. 53 Black Langshans, 131 eggs; No. 24, White Wyandottes, 129 eggs.

The English pen of S. C. White Leghorns won the silver cup for December with a record of 222 eggs. This pen is getting quite a good lead over the other pens. They continue to be more active than any pen in the contest, and are consuming quite a good deal more dry mash than the other Mediterranean varieties. These birds differ from the American Leghorns in the fact that they have larger combs, tails are not well spread and rather high, and eyes are not bay in color. They are an interesting lot of birds, however, and seem to have the ability to lay. Their eggs are not of an uniform dead white color, like many of our American strains of Leghorns.

The monthly record of each individual and pen, and the total pen record for the first six weeks for each pen of ten birds is shown in the table.

Our Feeding Test.

In connection with our egg laying contest, we are trying out ten different methods of feeding. The birds used in this test are one-half Buff Orpingtons and one-half White Leghorns. The Orpingtons are all of the same breeding, all pullets, and as near the same age and weight as we could get them. The White Leghorns are composed of four pullets and one hen in each pen, of the same breeding, same age and practically same weight. The exact method of feeding one of these pens will be announced each month. You can make note of the formula used and watch the results. You can be your own judge as to the practicability of each method. We expect to also be able to determine the most economical method for use in this section.

Connecticut Method—Pen No. 61.

Scratch Grain Mixture.—60 lbs.. cracked corn, 60 lbs. wheat, 40 lbs. heavy white oats, 20 lbs. barley, 10 lbs. kaffir corn, 10 lbs. buckwheat, 10 lbs. coarse beef scrap.

Dry Mash Mixture.—200 lbs. coarse wheat bran, 100 lbs. corn meal, 100 lbs. glutten meal, 100 lbs ground oats, 75 lbs. standard middlings, 50 lbs fish scrap, 50 lbs. beef scrap, 25 lbs. low grade flour.

A Norwich Automatic Feeder is used for the grain and the birds are allowed to feed themselves, except during the long summer days, it may be necessary to close the grain feeder a part of the time. The dry mash is kept in a hopper or receptacle for that purpose. The mash, as well as grit, shell and charcoal, are kept continually before the birds. Succulent food consisting of apples, mangel wurtzels, green cut corn, or dried beet pulp may be used. The dry beet pulp is used principally, and is soaked in water (and usually warm) for about an hour before being fed. It consists when dry of about 8 per cent of the dry mash by weight.

In the feeding test, in pen 68, where feed of twenty-eight different kinds is kept before the birds at all times, these pullets made a rapid gain on the other pens toward the last of this month. Our prediction is that they have been or are being stimulated to high production and may keep it up for a time, but will finally become over fat, drop off in egg production and break down in health. It is going to be interesting to see just what they will eat, the greatest quantities of what they like best, and what the final results will be as to their general health and the number of eggs laid under this method of treatment. More pullets are now laying in this pen than any other. We also keep buttermilk and water before them at all times and record the amount of each consumed.

We are feeding ground meat and ground mustard to one pen, No. 66, but so far it has not made much of a record.

The farmer's method of feeding where the hens get a very simple ration, the yield thus far indicates that it might pay the average farmer to buy a little beef scrap, alfalfa meal, and a few other ingredients to add to his rations.

These one hundred pullets used in this feeding test are laying many more eggs daily than two hundred of their full sisters on the outside which are not being fed as heavily as these in the tests. This is but another proof that if you want eggs in winter, your hens must be fed liberally.

The town does not need the retired farmer while the farm needs his experience and his capital. A retired farmer is capital going to waste.—United States Department of Agriculture Report.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

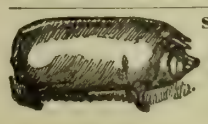
NEVIUS' SHORT-HORNS AND POLAND CHINAS

Good young bulls, reds and roans by our herd bulls, also few good boars ready for service. Write or come and see them. Mention this paper.

C. S. NEVIUS, - CHILES, KANSAS

JOHN R. TOMSON, Dover, Ks.

My herd of Shorthorns are now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.



GOOD SHORTHORNS

Reds and Roans.

1 car load of bulls for sale.
1 car load of heifers for sale.
These are rugged, blocky, good feeders—the kind the country needs.
H. C. Lookabaugh, Watonga, Okla.

SHROPSHIRE SHEEP.

I have purchased from G. W. Patterson his entire flock of high class Shropshires. I have more than I need and will sell one or two carloads of the breeding ewes. Also have lambs for sale by McKerrows 1834 (07133 R), the sire of 81 first prize and championship winners at World and State Fairs. For prices and particulars write H. Schofield, Worthington, Nobles County, Minnesota.

SWEEPSTAKE 28006 WEIGHS 1,200 LBS. FIRST AND CHAMPION boar at Iowa, 1912, heads our herd of Chester Whites. WE SHIP C. O. D. AND PAY ALL EXPRESS CHARGES. Choice, growthy pigs of both sex, no akin. Catalog free. We also offer for sale recorded Shire fillies and mares in foal. Address, B. M. Boyer & Sons, Farmington, Iowa.

Standards for Ground Feeds.

What the Kansas Law Says You Should Get When You Buy Shorts, Bran and So Forth, and How to Be Sure.

Prof. L. A. Fitz, Department of Grain Improvement, Kansas Agricultural College.

How do you buy your bran, shorts, mill run, or corn chop? Do you suppose that all bran, or all shorts, or all corn chop is alike? Do you suppose that a mixture of corn chop and corn bran is just as good for feeding purposes as pure corn chop? If such mixtures are not just as good, then it becomes self evident that they are not worth as much money as the pure article.

But, you ask, how can I as a consumer tell when I buy a sack or a ton of bran or of shorts whether or not it contains screenings or other foreign material and whether it is of high or of low feeding value? The Kansas State Feeding Stuffs Law requires that all mixed feeds and all concentrated feeds in which the composition of the original material is changed must be registered with the director of the experiment station and that a statement regarding the ingredients used in any feed must also be filed with him.

It further requires that the following information or label shall be placed upon each and every sack or package of such feeding stuff:

1. Name and address of manufactur or seller.
2. Registered name, brand or trademark.
3. Net weight of package.
4. Guarantee giving minimum percentage of protein and fat and maximum percentage of crude fiber.

Hence, if screenings or corn bran or kindred substances are mixed in with the pure feeds the manufacturer must so state plainly on the label. Every purchaser should examine carefully the label on his feed so that he may know what it is represented to be. Then he should examine the feed to see whether or not it is true to the name or brand under which it is sold.

By simply examining the feed the consumer can tell little or nothing concerning the amounts of protein, fat, and crude fiber it contains. It requires a chemical analysis to determine such constituents. Hence the value of having a guaranty plainly stated.

Protein is a term used to designate the compounds containing nitrogen. It is important because it is the constituent of the food used in forming new animal tissues and repairing the wear and tear incident to the life processes.

The Fat (or ether extract) in our concentrated feeds is composed mostly of vegetable fats and oils. This is used in the animal body as a source of body fat and to furnish heat and energy for the animal.

Crude Fiber is the cell wall, fibrous, woody portion of the plant. It resists the action of the digestive juices. The bacteria in the intestines cause some of the crude fiber to be digested but this operation requires so much energy that it consumes a large portion of the value derived from the crude fiber. Hence, of two samples of shorts having equal amounts of protein and fat the one containing the small percentage of crude fiber is most valuable.

In our mill feeds which are the natural by-products resulting from the manufacture of various cereal foods there is a decided variation in composition. This is to some extent due to difference of composition in the original material but to a much greater degree it is due to the process of manufacture and the way in which the different mill streams are combined to produce a given feed.

It is not enough for the consumer to know that a given lot of feed is pure shorts or pure bran. He should examine the guarantee as well as the brand and see what analysis is given. The following maximum and minimum percentages found together with the ranges and averages calculated show this information should be carefully considered when buying feeds.

Results of analyses of concentrated feeding stuffs:

Standard Shorts—113 Samples.	Protein	Fat	Crude Fiber
Maximum	23.78	5.93	8.11
Minimum	14.04	2.16	2.22
Average	18.45	4.35	5.52
Bran—88 Samples.			
Maximum	22.38	4.97	12.55
Minimum	13.29	2.84	5.99
Average	17.24	4.24	10.60
White Shorts 12 Samples.			
Maximum	19.57	4.98	6.05
Minimum	15.88	2.46	2.10
Average	17.55	3.72	4.07
Brown Shorts 6 Samples.			
Maximum	20.40	5.57	8.28
Minimum	17.20	4.26	5.25
Average	18.87	4.92	6.76
Bran and Screenings— 29 Samples.			
Maximum	19.74	4.88	13.07
Minimum	14.26	3.37	8.65
Average	17.32	4.37	10.86
Mill Run— 15 Samples.			
Maximum	20.18	4.75	11.18
Minimum	15.62	3.93	7.40
Average	18.11	4.37	8.73
Mill Run and Screenings— 5 Samples.			
Maximum	20.09	4.75	8.99
Minimum	17.59	4.19	8.00
Average	18.93	4.46	8.59

Whether or not the addition of screenings to bran will lower its feeding value depends upon the character of the screenings. If these consist very largely of broken or shriveled wheat kernels the value of the bran may be increased. On the other hand, if the screenings consist largely of weed seed or chaff and straw the feeding value will be greatly lowered by mixing in such material In addition to this the farmer runs the risk of bringing onto his farm seed of bad weeds which will be scattered about the place in the manure. Even if the screenings are ground it does not insure that all the small seed will be too badly broken to germinate. Consequently it becomes necessary for every purchaser of any such mixed feed to be on his guard.

Any feed that consists solely of the unmixed chop or meal made from the entire kernels of any grain and no portion of the product abstracted nor any substance added thereto does not require registration and label. Thus pure corn chop does not need to be registered.

In case any manufacturer or consumer finds that the law is not being complied with he should at once notify the Feed Control Section, Experiment Station, Manhattan, Kansas.

BROUGHT INQUIRIES AT LOWEST COST.

To the American Breeder: I take pleasure in advising you that the American Breeder stood second highest in the list of inquiries for catalog of our December 10th Percheron sale, also that the cost per inquiry was the lowest. Inquiries were from a wide range of territory, showing that your paper is read throughout the country.

Congratulating you upon the remarkably good showing made by the American Breeder, I am, Sincerely yours.—W. S. Corsa, White Hall, Ill.

KEROSENE, GASOLINE, OIL

WHOLESALE PRICE TO CONSUMERS—Combining Best Quality With Low Price. NO WATER IN MY KEROSENE OR GASOLINE.

XXX 46 gravity water white kerosene .....$5.50 for 52 gal. bbl.
XX 42 gravity kerosene (the kind usually sold) .....$4.75 for 52 gal. bbl.
XXX 64 gravity gasoline .....$8.75 for 52 gal. bbl.
1 case graphite axle grease (2 doz. 3 pound pails) $3.50
40 gravity prime white stove distillate .....$4.25 for 52 gal. bbl.
38 gravity stove distillate .....$4.00 for 52 gal. bbl.
60 gallon (26 gauge) galvanized steel tank with pump and hood cover complete—a great convenience in every home..$3.60
Extra heavy pure crude oil, steamed and settled (black oil) good lubricant, just the thing for greasing tools.....$3.50 for 52 gal. bbl.
STANNARD'S PROCESSED CRUDE OIL, the best dip made for killing lice and curing mange. One application will do more to kill lice and cure mange than three applications of any other dip made (it destroys the nits) .....$5.00 for 52 gal. bbl.
I also carry a full line of lubricating oils.
I will pay $1.25 each for crude oil barrels; $1.50 each for refined oil barrels, returned to me at refinery in good order, freight prepaid.

C. A. STANNARD, BOX A, EMPORIA, KAS.

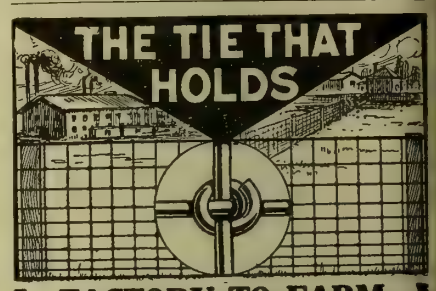
WOVEN WIRE IN STALLION FENCE

To the American Breeder: I have a lot fenced off for my stallions. I set posts in the ground three and one-half feet, leaving six and one-half feet above the ground. I used good boards, eight inches wide, one inch thick and four inches space between the boards. I used four boards at the bottom and used woven wire at top of fence. I stapled the bottom wire so the horses could not rear or kick over the boards, and this wire being at the top of fence lets in light and will not pull over post. I have used it for three years and it gives satisfaction.—B. E. Lite, Davis County, Ia.

To the American Breeder: I use 11-foot posts, leaving eight feet above surface, placing them eight feet in space, so there isn't any chance of weakness between the posts. Use 16-foot plank, six boards high, making a four inch space so that the animal cannot either put his foot or head through the cracks, that he might reach other stock. Above the planks I use woven wire so that the fence will not be top heavy. This makes the fence strong and the fence does not cast much shade.—S. M. Myers, Knox County, Mo.

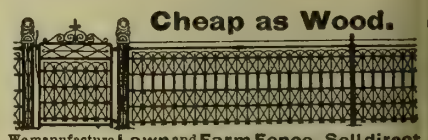
To the American Breeder: For a stallion fence take woven wire four feet high, set posts in the ground about eight feet apart, raise wire from ground two feet, put two barb wires on top to make fence about eight feet high. I have a fence of this kind that I have had for five years and have had four different stallions in it, and it has proven all right. Woven wire is much better than boards. It lets in air and sunshine, and that is what the stallion needs. One way to prevent diseases is to have the barn opening into a lot surrounded by a fence of this kind so that the stallion can run in and out at will. This kind of a fence is not expensive. Forty rods of wire will make it ten rods square, costing about 50 cents per rod, or $20.—Will Maxwell, Muscatine county, Iowa.

FAT STALLIONS; CAPSULE COLTS.

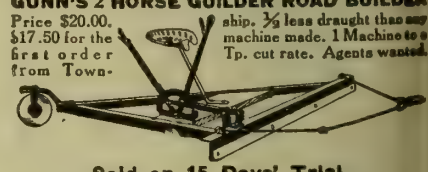


To the American Breeder:—I will send you a picture of my full blooded imported Percheron stallion. He is five years old, 16 1-3 hands high and weighs 1,910. He is not fat; has good heavy bone, good feet and legs, extra broad at both ends with a good middle, heart measurement 92 inches, middle 99, and just in front of the sheath 94 inches. I do not believe in keeping a stallion too fat. I just keep them in good living shape. I think a good many stallions are ruined for breeders by keeping them too fat. I think the farmers are to blame for the stallions being kept too fat, for the first thing a farmer will ask is how much does your stallion weigh? They pay no attention to form, legs and feet, but just to weight. If farmers would pay more attention to the conformation of a stallion and not so much to weight and fat they would fare far better in breeding, in getting more colts and better ones. Some men take a stallion that should weigh 1,800 or a little better and fatten him up to 2,100, then he looks like a cow at a fat stock show and can stand but very little exercise in hot weather, and that is one thing that makes so many poor breeders.

As to the capsule breeding, it is all right. In 1911 I used only three capsules, as the farmers did not believe in it. They thought the colts would be weak and not live. I was so far behind with my mares that I could not breed three mares with natural service for a week, so I bred them all from one service of the horse and they all three brought colts from that serv-



AGENTS—$173 IN TWO WEEKS,
Made by Mr. Williams, Illinois, selling the Automatic Jack Combination 12 tools in one. Used by auto owners, teamsters, liveries, factories, mills, miners, farmers, etc. Easy sales, big profit. Exclusive county rights if you write QUICK. **Automatic Jack Company, Box O, Bloomfield, Ind.**



Sunshine Lamp 300 Candle Power FREE
To Try In Your Own Home
Turns night into day. Gives better light than gas, electricity or 18 ordinary lamps at one-tenth the cost. For Homes, Stores, Halls, Churches. A child can carry it. Makes its own light from common gasoline. Absolutely SAFE.

COSTS 1 CENT A NIGHT

"Can't Sag" Gates Save You BIG MONEY

Cost only one-third as much as ordinary iron, wire or gas pipe gates, but last twice as long. Neat in appearance—best and strongest gate made—light, easy to handle, opens both ways. Boards are double *bolted* between eight angle steel uprights and double truss braces. *guaranteed never to sag.*

Cost Less Than All Wood Gates—Last 5 Times as Long

Can't Sag Gates are furnished complete, ready to hang, or just the Gate Steels which include everything except the boards. Patent self-locking hinge feature---reinforced two piece malleable hinges. Six Triangular Truss Braces make gates extra strong.

Improved Elevating Attachment permits the gate to be raised full length from 5 to 30 inches, so small stock can pass under, and to swing over snow.

"Can't-Sag" Gates & Steels

30 Days Free Trial and 5 Year Guarantee

Catalog shows both complete Gates and just the Steels, at prices you can't afford to miss. Send for my new catalog with free 30 days' trial and *freight prepaid offer.*

Now Selling at FACTORY Prices

FREIGHT PREPAID

This is a special 30-day sale of 10,000 sheets of Edwards Steel Shingles. Our direct-from-factory prices are suprisingly low. And we now pay all the freight. Here is a great bargain—an opportunity to buy the most durable, fireproof roof for much LESS than the commonplace kind.

Edwards STEEL Shingles

outwear FOUR ordinary shingle roofs, are ten times easier to put on, and yet, THEY ACTUALLY COST LESS THAN WOODEN SHINGLES. They cost LESS, mind you.

Do not judge Edwards Steel Shingles by common galvanized iron roofing—the kind that rusts. We have invented a method that absolutely prevents rust from ever getting a foothold, as 100,000 delighted owners of Edwards Roofs have found out. It's the famous Edwards Tightcote Process applied to genuine Open Hearth Steel.

STEEL Shingles Easily Put On

You don't have to nail these steel shingles, like wood shingles, ONE AT A TIME. Put on as high as 100 at once, for they come in big sheets ready to nail on sheathing or old roof. Much easier than putting on wood shingles. No extra materials to buy, no painting to do, no tools to borrow. Your hired man can do the job.

No Danger of Fire

No, Sir, you don't ever hear of any building burning up if it is roofed with Edwards STEEL Shingles. It's the man who roofs with wooden shingles or composition paper who loses by fire his house or barn.

Why risk life and valuable property when you can make your buildings practically fireproof simply by roofing with Edwards STEEL Shingles?

Every Edwards roof is guaranteed against lightning by a $10,000 bond.

WRITE! Send postal at once for our latest Roofing Book No. 2364 and Special Factory Prices. Give size of roof, if you can. (94)

THE EDWARDS MANUFACTURING CO.
2314-2364 Lock Street, CINCINNATI, OHIO

ice. All the colts were good ones and are still alive and good. In 1912 I used a good many capsules, bred as many as four mares at a time (could have bred ten) and all four are in foal, three at another time and all are in foal. I used them on mares that had never brought a colt, although they had been bred for years, and I got the most of them in foal. I think it is a much surer way to breed than the natural service.—W. H. James, Christian County, Illinois.

PREVENTION OF BOTS IN HORSES

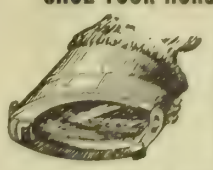
To the American Breeder:—Take a piece of soft cloth or waste, moisten with coal oil and rub over the legs and shoulders of horses infested with bot eggs or "nits." Otherwise, the horse licks the eggs off his body, the saliva dissolves the shell of the egg, the larvae is swallowed and develops in the stomach. Few persons realize how much damage bots really cause to a horse. Each bot is firmly attached to the stomach-wall and after they drop off, the small puncture develops into an ulcer that does not heal. Prevention is better than cure. E. T. Baker, Veterinarian, Idaho Experiment Station.

LICENSE KEEPERS; NOT STALLIONS.

To the American Breeder: I have read the correspondence from Calhoun and Marshall Counties, Ia., on the stallion and jack laws of Iowa and do not agree with either. The trouble with the stallion business is: there are not enough colts foaled. Repeal all the stallion laws we have and make the keeper take out a license instead of the dumb brutes. Make the examination similar to the one the government has its foremen pass before they can take charge of the government breeding barns, have them take a rigid examination on the contagious diseases that are contracted only by breeding such as Dourine coital examthema, euretheral gleet, leucorhea, contagious abortion and various others which the mares and stallions of Iowa are infected with. They are no worse than the mares and stallions of other states. One term at the Graham Scientific Breeding School, a government veterinary book (Bulletin No 42), with some study, and any keeper ought to be able to pass the examination. Make it a misdemeanor for the keeper of a stallion or jack to breed a mare that has any of the diseases that the male passes on, or uses his stallion or jack after it has become infected, punishable by revoking his license for a period of five years, and a fine not to exceed $100. This will stop the spread of diseases. If you want to make any business pay, you cannot carry accounts without interest for more than six months. Let us stop hallowing "wolf! wolf!" and get down to real cause. Why do not more than 33 per cent of all the mares bred in the United States produce foals? Is it because of the Iowa stallion and lien laws?—C. A. Luce, Decatur County, Iowa.

SCANT COMFORT FOR "C."

To the American Breeder:—You requested subscribers to reply to "Kansas Subscriber" about "Would you refund the money?" I would not refund any money or give "C" another season. The season was settled when "C" sold the mare and settled for same. The colt would, no doubt, have come O. K. had the mare not sickened and died. This case reminds me of a man in my township who sold a team after the assessor had taken his stock. He put up a big row at the "Town Meeting" to get the team taken off the assessor's books. Now, everyone knows the impossibility of such an action and everyone ought to know that when a stallioner has fulfilled his part, the only thing left to do to close the season is for the mare owner to pay up, and when paid it should take better reasons than those set forth in this case to justify another season.



I am a mare owner and believe in getting all that is coming to me, but having done so, I try to keep my troubles to myself, if all is not as I might wish.—A. C. Petterson, Hankinson County, N. D.

To the American Breeder: I want to tell the readers of your paper what I think is a good way to have a colt show. I have tried to give premiums but I say that it did not give satisfaction. So I think the nicest way and the one that treats everybody alike and that is to have everybody come and bring their colts and have two

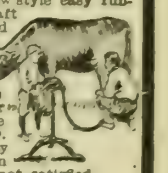
SHOE YOUR HORSE WITHOUT NAILS

Many horse owners shoe their horses with Celebrated SHAFFER Nailless Horseshoes. Won't allow nails driven in horses' hoofs. Easily attached. Horses do more work. Write for prices. Agents wanted. Parcel Post on set of shoes.

National Nailless Horseshoe Company,
20th & Commerce Sts., Dept 26,
Philadelphia, Pa.

IMPROVE YOUR STOCK

It Pays to Clip



Horses, Mules and Cows. They are healthier and render better service. When the heavy coat that holds the wet sweat and dirt is removed, they are more easily kept clean, look better, get more good from their feed and are better in every way. The best and most generally used clipper is

The Stewart Ball Bearing Clipping Machine

It turns easier, clips faster and closer and stays sharp longer than any other. Gears are all file hard and cut from solid steel bar. They are enclosed, protected and run in oil; little friction, little wear. Has six feet of new style easy running flexible shaft and the celebrated Stewart single tension clipping head, highest grade.

PRICE $7.50

Get one from your dealer or send $2.00 and we will ship C. O. D. for balance. Money and transportation charges back if not satisfied.

Great Horse Story "Kate and Queen" By Prof. Jesse Beery Free

A most wonderful and unheard of book offer. It equals the famous "Black Beauty" in human interest—surpasses it in practicability. "Kate" a victim of poor handling is vividly contrasted with "Queen" who was more fortunate. You sympathize with one—rejoice with the other—even as you sigh for the slum waif and laugh with the child of fortune.

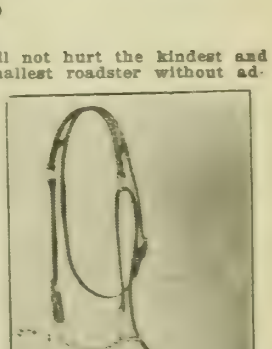
Prof. Beery has skillfully woven into this intensely interesting and true story, many valuable suggestions for handling horses—a result of a lifetime's experience.

SPECIAL FREE OFFER

Prof. Beery desires that every horse owner, trainer, breeder—everyone interested in horses—should read this great story. To make it possible, for a short time he offers every interested horseman a copy FREE. He only asks that ten cents be sent to cover postage, and the names and addresses of five other horse owners. Send U. S. Stamps or coin. If you have even a passing interest in horses—if you own, train or breed them, you will gather from this book a fund of knowledge worth many dollars to you. Send for copy.

FREE With each book we also send free a beautiful colored picture of Queen--oil painting effect--suitable for framing.

PROF. JESSE BEERY, Box 712 Pleasant Hill, O.



"Queen"

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG
Assumption, Christian County, Illinois.

barrels of lemonade, and two or three boxes of cigars and some ice cream, and all have a good time. Have some one taking the pictures of the colts and some one to lecture on the progress of the horse business. I think this an ideal colt show. D. H. Perrin, Decatur County, Kas.

DEVELOPMENT OF HORSES.

To the American Breeder: I do not think some peope have the right idea when developing a young horse. I have only been in the stallion business for a short time. I have found it to be the opinion of some people that the fat horse is the best developed. If their opinion is correct, I need a new one.

A horse that is carrying from 100 to 300 pounds excess over and above what I think constitutes a well developed horse, is carrying something that he would be better off without, and there is where many a green buyer buys something they do not want at all when they find that they have already bought. I think a surplus of fat is a detriment to an animal. Some people say to me, "Your horse is a little undersize." I can show anyone horses within a short drive—horses that are not a bit better horses and have no larger bone, but on account of this surplus fat makes a big showing and makes a horse look larger. I would not want a man to judge a horse for me if he could not judge a horse, whether he was with or without fat. What I would judge a well developed horse to be is a horse of good uniform build; good big flat bone, wide breast, deep heart and made up with good heavy muscle. An animal overflushed with fat has no such constitution and mental powers as a horse with a reasonable amount of fat.

What I think it takes to develop a good solid individual is a reasonable amount of pure feed to keep him in fair shape; plenty good, fresh water and all the liberty that can be had, will develop a horse with a sounder constitution and a better and more serviceable animal; while it may not pull so heavy on the scales, but will be more horse there than a man needs if he needs any at all, and if he needs any at all he needs one with muscle instead of surplus fat. A surplus of fat disqualifies an animal from manual labor, breeding, driving or any other useful purpose. I am 26 years old and intend making horses a study, and if my opinion is wrong, I wish to have it changed.—L. M. Escell, Shelby County, Ill.

NOT ALL SCRUBS ARE GRADES.

To the American Breeder:—We hear much, in this progressive age of horse-breeding, about the grade and the scrub stallion and rightly we should. The kind of stallion which stands for service in a district is a fair indication of the class of horses which in a few years will dominate that district, and surely this is enough to make mare-owners use the utmost precaution in selecting sires. The grade stallion does not stand in favor with the best breeders, because they all understand the value of pedigree. There are those, however, who place too much confidence in pedigree, and are not exacting enough in the individual requirements of the horse. The scrub which does most damage in horse breeding is not always the grade scrub, but often the pedigree stallion, whose pedigree is used as a blind to cover the eyes of the somewhat lax breeder, and also as a blanket to hide all the deficiencies of individual conformation and quality. A pure bred horse gets no inconsiderable amount of patronage by reason of his breeding. If he is a representative of a distinguished line of blood, and is himself a nondescript type, he may do a great amount of harm, because people rely upon the blood of his ancestors to repair or counteract what he lacks in conformation. Here is where the pedigreed scrub gets the opportunity to do more damage than the non-pedigreed inferior animal. His influence is greater because he gets more mares.

Now, what are the chances of pedigree overcoming, or making up for, lack of quality or individual conformation? Considering laws of breeding from a theoretical, as well as a practical viewpoint, the most direct influence upon offspring is that of its parents, and declining proportionately and regularly as generations recede one after another. Thus it was believed by Galton, and his theory seems plausible, that a colt would contain 25 per cent of the characteristics of each of its parents, 12½ per cent of each of its grandparents, 6¼ per cent of each of its great grandparents, 3⅛ per cent of each of its great-great grandparents, and so on infinitely. It is clearly seen that the blood of the horse a few generations back has very little effect upon the offspring. Pedigrees are mighty valuable in their place, but they can never take the place of conformation, can never be satisfactorily used as a substitute for a scrawny, flat-ribbed, light minded, coarse-haired, meaty-legged, faulty-going horse. If every animal which appears in the pedigree were noted, and the individual below par in type and conformation, he should not be used. His is the influence which most directly governs the destiny of his colts. Beware of the scrub traveling on pedigree alone. Get the horse with the good pedigree attached to faultless conformation. T. Nunn, Yahill County, Oregon.

QUESTIONS AND ANSWERS.

(Continued from page 5.)

jacks in that country. Big Montana mares, when mated with a good, big jack, will produce good mules.

Crooked Colts—Two years ago one of my neighbors bought a good Percheron mare from a man traveling through the country. The mare is a fine one to all appearances and was with foal, but nobody knows anything about the stallion. She brought a colt that was very crooked in the hind legs. She was then bred to a good horse that seems to get all of his colts with very crooked hind legs, and that colt was the one I last saw. The mare is now in foal to my 2,200 pound Percheron. The stallion is a proven breeder in Colorado, but his first colts in New Mexico come this spring. Now is the fault with the mare or the other two stallions? Is she likely to bring a crooked colt from my horse? And is there anything to do to help her. When she begins to get heavy with foal she stands around with her head down and seems to make bag for a longer period before foaling than most mares, although I have seen a few that were her equal in this respect. If you can throw any light on this subject, kindly do so.—New Mexico Subscriber.

REPLY—This is probably a hereditary tendency in the mare to produce crooked colts. This mare should be worked at moderate farm work regularly up to foaling time. This will keep her in a better condition, as she will be forced to take her regular exercise. This may be the difficulty. All pregnant females should have sufficient exercise during pregnancy; great care should be taken not to over exert her. The feed should be regular and good care should be given at all times.

Diseased Mare—I have a mare about ten years old that raised a colt last summer. Since she had the colt she has not been right. When I work her she will start out all right, but will soon throw her hind parts over to one side so that the tug rubs the hide off her leg making it sore. When working she passes water quite frequently—a little bit at a time—which smells quite strong and at times is thick and of a grayish or yellowish color. She acts as though she was in pain at times. When not working she seems to feel all right. She was bred again last summer, but I don't think she is with foal. She eats good, but don't do as well as she should. Do you think she is hurt in the kidneys? Or what is the matter with her? And what remedy would you recommend for her ailment?—South Dakota Subscriber.

REPLY—Have a qualified veterinarian examine the genital tract to see if she is not seriously diseased in the uterus; also have him make a rectal examination of her kidneys and ovaries. The diseased condition in the uterus may have extended to the ovaries. It is difficult for us to make more than suggestions in a case of this kind without having an opportunity to make a better investigation.

Thoroughbred—Will you kindly tell me what is meant by "The Thoroughbred" horse, as there seems to be some confusion among our neighbors as to the meaning.—Utah Subscriber.

REPLY—The Thoroughbred is the oldest recognized breed of horses in the world, for which a registry association has been maintained. The word "thoroughbred" should not be used for any other horses; other registered horses should be called pure breds.

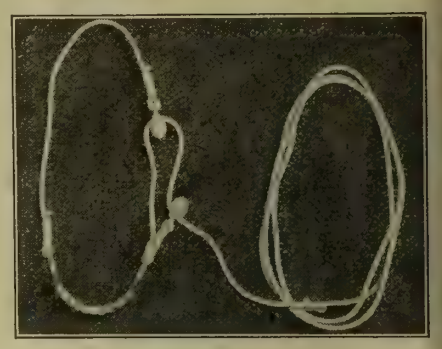
Itchy Stallion—What can I do for a stallion that is itchy from his knees and hocks to his hoof most all the time? I have been using cresol dip, but without effect.—North Dakota Subscriber.

REPLY—Feed this stallion a teaspoonful of glauber salts once a day to begin with, and gradually increase until his bowels are in a good condition. Change his feed to oats and bran, equal parts by measurement. Give a little salt in his feed so as to encourage him to drink more water. Be sure that your hay is good and bright; clean your barn and spray the premises with your dip.

Stallion Sores—Will you tell me what is the matter with my imported stallion? I got him a short time after he was imported. I got him in March and the last of June he got a sore on his right hind leg in front of hock and on the left half between the knee and pastern, and it would bleed badly by spells and then scab over and then bleed again. It did the same thing last season on one leg and on his back and I could not heal it until the fall. The veterinarian said it was "importing fever." He had been sick on the boat and after he landed a short time, but has never been sick since and has been a sure breeder. The spots do not hair out right. He foals good. Can you tell me what to do to prevent him from getting sore and make the spots hair out?—Ohio Subscriber.

REPLY—If you will give this stallion plenty of exercise and keep his legs clean, with good nutritious feed composed of oats and bran, equal parts by measurement, and good bright prairie or timothy hay, and keep your barn clean, you should not have any sores on your stallion. If pimples should break out anywhere on this horse, feed him a little glauber salts and increase or decrease so as to keep his bowels in a good condition. Do

"CONQUEROR" STALLION BRIDLE



GUARANTEED TO HOLD ANY STALLION OR JACK.

This bridle is made of especially selected material, absolutely the best on the market.

Can be adjusted to fit any size head and for either hard or tender mouths.

Just the thing for breaking runaways or kickers. Be sure to read directions.

We prepay the postage or express charges and sell these bridles at **$2.50 each.** Return bridle any time within a month, if it don't do the work and your money will be refunded. That is our guarantee.

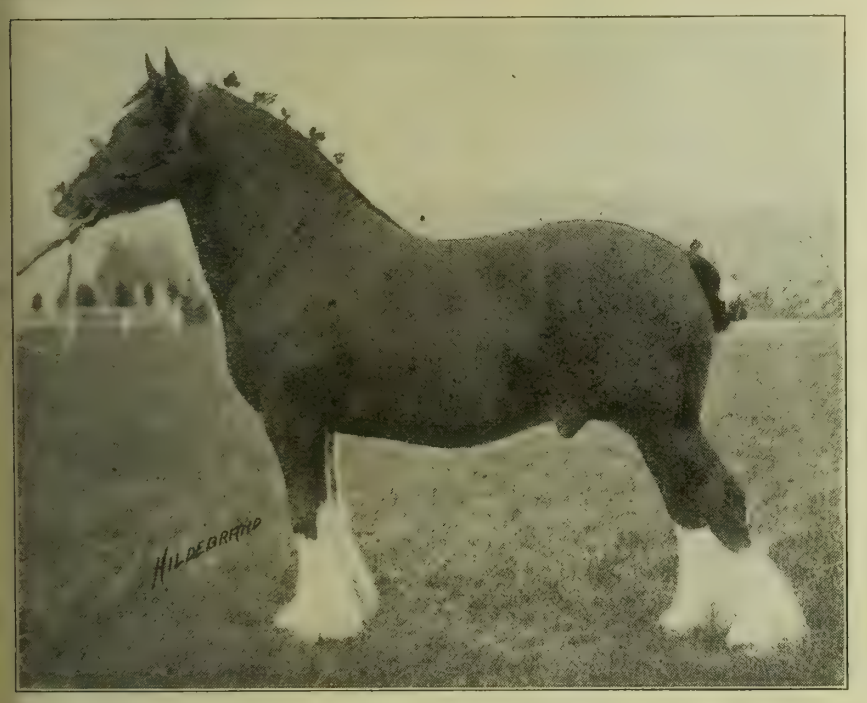
will reduce inflamed, swollen Joints, Bruises, Soft Bunches, Cure Boils, Poll Evil, Quitor, Fistula or any unhealthy sore quickly; pleasant to use; does not blister under bandage or remove the hair, and you can work the horse. $2 per bottle, delivered. Book 7 F free.

ABSORBINE, JR., liniment for mankind. Reduces Painful, Swollen Veins, Goitre, Wens, Strains, Bruises, stops Pain and Inflammation. Price $1.00 per bottle at dealers or delivered. Will tell you more if you write. Manufactured only by

W. F. YOUNG, P. D. F., 388 Temple St., Springfield, Mass.

not feed any corn to a patient of this kind. The hair will not grow on the spots which are now bare. You may have to exclude the flies from this animal in order to prevent a recurrence of these sores. The hair is gone and there is no protection from the flies; a very small space may become raw which affords an opportunity for flies to infect these sores. Flies are great carriers of infection. It is a very cheap method of keeping your stallion in good condition to screen the stall.

Contagious Abortion—If a mare aborts, can a stallion by serving this mare, carry the germs to another mare, causing her to abort?—South Dakota Subscriber.



REPLY—Every mare that has aborted from any cause should be watched closely, as the average breeder is not able to diagnose the difference between contageous abortion and accidental abortion. Contageous abortion can be transmitted from one mare to another through the act of copulation. If a mare has lost a colt from contageous abortion, or in fact any other cause, she could be cleaned out by one who is familiar with infection. Contageous abortion is getting to be very serious in certain parts. A later article will deal with this subject.

Largest Number of Registered Horses—In your last issue I notice an article stating that the number of Standard bred stallions in the United States exceeded any other breed. Can you give me approximately the number as compared with the name and number in second place?—Texas Subscriber.

REPLY—There are more registered standard bred horses in the United States than any other breed. A few years ago the Thoroughbred horses would have occupied the second place but so many of these have been shipped to other countries; many have been discarded and sold without certificates, owing to the antagonistic racing laws. Percherons now rank second in the number of registered horses. We are not prepared to give the exact number as many have died and it is only a matter of guess as to how many there are now.

Breaking a Young Jack—Will you please tell me how to break a young jack? I have a jack two years old this spring. Is he too young to breed this spring? And how many mares can I breed to him?—Nebraska Subscriber.

REPLY—The proper time to begin with the jack is at weaning time, which should not be later than six or seven months of age. He should be separated from all jennets, jacks and mules. He should be in a corral where he cannot see any of his long eared relatives. His associates should be horse stock, and this should all be young and timid so that he will be the master of the situation. He will grow to maturity and never know that he is a jack unless he is associated with those of his own kind. The early association of a jack has much to do with his future usefulness. Every one should pay particular attention to this and see that they are excluded from the view of all long eared animals and that their associates should be horse stock. Jacks raised under these conditions are very easily broken. Jack colts should not be raised with hogs or cows, and the one that cares for them during the first two years of their life should use them during the first breeding season, if possible. Ladies should not feed or handle young stock as there are many cases on record where a man has been compelled to don the uniform of a woman before a jack would make his first service. Other cases are reported where young jacks must be associated with cows before they will perform. It seems to us that a lot of jack breeders are very dilatory about this rule or there would not be so many slow jacks in the country. After a jack has reached the age of 30 months he may begin to breed a few mares; some start them at two years of age; others contend that three years would be better. A jack 30 months old can breed eight or ten mares during one season, with no two services closer than one week. The first service made on a small, gentle mare in very good heat. That first service should be made about right, for it is this service that the jack will remember through life. Be careful not to make any mistake at this particular time. Handle the jack gently and carefully; take plenty of time; after he has smelled of the mare give him a little while to make the service. If he does not make it put him back in the stall a little while; take the bridle off; give him another trial. Be sure that the jack stays on until the penis is withdrawn before he gets down, then you will have a good server. Encourage him to stay on; have the mare well pitted if he is to be used as a pit jack; be careful that he does not get hurt or frightened before this service is made. The keeper should be his care taker. He should be fondled and petted so that he will not be afraid of any one. Some jacks have more life and energy than others. By gentle handling this class may become a little unruly, but it is better to have an unruly jack than one which is very slow. An unruly jack can be handled with a severe bridle.

SEVERN FLAG 12749 (28763), grand champion Shire stallion Illinois State Fair, 1912, and first in class and reserve champion International, 1912. Owned by Taylor & Jones, Williamsville, Ill.

A Genuine Rupture Cure Sent On Trial To Prove It

Don't Wear A Truss Any Longer

After Thirty Years' Experience I Have Produced An Appliance for Men, Women and Children That Actually Cures Rupture.

ARE YOU RUPTURED?

If so, the BROOKS APPLIANCE is made for You; You and all other Men, Women and Children who are sufferers from this annoying and dangerous from this annoying and dangerous trouble. That truss you have been wearing—one of many you have tried—chafed and irritated you and was worse than nothing. It had springs and pads and harness and straps and fixings galore and was continually getting out of shape—slipping down or working up and always needing attention. Then, there were salves and washes and ointments to make the case worse and harder to bear. I want to say that you will find none of these annoyances and vexations in the BROOKS APPLIANCE. At least they are reduced to a minimum. This APPLIANCE was made with a view to eliminate, to do away with, just such trouble. I would have been foolish to work half a lifetime, thinking out and perfecting a thing that had no advantage or was not better than scores of other inventions upon the market. In my APPLIANCE you will find the old objectionable features LEFT OUT. You will find it easy to wear. You will scarcely realize you are wearing it. There is no binding, drawing and slipping out of place. It does its work effectively and with comfort to the wearer. I want you to read my book, in which I have taken pains to give full particulars about it. Then, there are a few letters printed in it—selected at random from among hundreds written by men and women who have been cured. You can write these folks and see what they say. If I were you I would see to this matter without waiting. You can put off some things without running much risk, but a rupture is a dangerous proposition to neglect. A rupture is not only bad and serious of itself, but it leads to things infinitely worse. Fill out coupon and mail TODAY. Tomorrow will do, but today is better.

DON'T MAKE THE CHILD WEAR A TRUSS THROUGH LIFE.

I Want to Reach the Parents of Every Ruptured Child in the Country.

The Truss Is a Flesh Torturing Invention Fit Only as a Relic of Barbarity

I want them to know about the Automatic Air Cushion Rupture Appliance that I make for children who are afflicted in this way.

The Brooks Appliance Cured His Rupture. Now he is as sound and whole as if he had never been ruptured.

My appliance can be put on any child with perfect safety to the little one. For growing children there is nothing better to be had—no matter how much you pay—than my Appliance. I want the parents or others who may have children in their care to understand that there should be no delay in getting proper help for ruptured children.

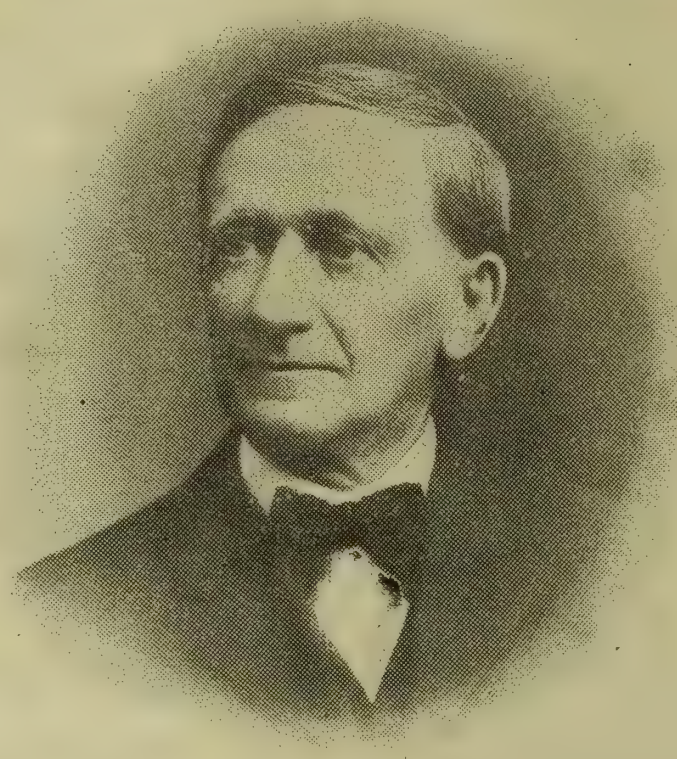
Every day that the rupture is allowed to go on without the right means of correcting it—just so much harder will it be for the child to get rid of it.

No ruptured child can ever be free from the thought of the rupture and it is not fair to any child not to have an equal chance with other children. No matter what we may wish to think—ruptured children do **not** have an equal chance.

Common trusses do not help.

Thousands of men and women know that from their own experience with such trusses.

But it is not necessary for children to wear harsh, cumbersome, steel truesses any more.



You may have had to wear something like this but don't make your child do it. Give the child something better.

My Appliance is better and I want to prove it to you.

I will make an Appliance to the child's measure, send it on TRIAL—put it into your hands to see and use and then you can say whether it is what I claim or not.

The Automatic Air Cushion conforms with every movement of the child; there is an even, gentle pressure which gradually binds the broken parts together—as you would bind a broken limb—and then no matter how much the child jumps, runs, rolls over or falls down—the pressure is kept up just the same—always drawing the parts together.

Write me today and get all the information—send the coupon.

The above is C. E. Brooks of Marshall, Mich., the Inventor, who has been curing rupture for over 30 years. If ruptured write him today.

If you have tried most everything else, come to me. Where others fail is where I have my greatest success. Send attached coupon today and I will send you free my illustrated book on rupture and its cure, showing my Appliance and giving you prices and names of many people who have tried it and were cured. It is instant relief when all others fail. Remember, I use no salves, no harness, no lies.

I send on trial to prove what I say is true. You are the judge and once having seen my illustrated book and read it you will be as enthusiastic as my hundreds of patients whose letters you may also read. Fill out free coupon below and mail today. It's well worth your time whether you try my appliance or not.

OTHERS FAILED BUT THE APPLIANCE CURED.

C. E. Brooks,
Marshall, Mich.
Dear Sir:—

Your Appliance did all you claim for the little boy and more, for it cured him sound and well. We let him wear it for about a year in all, although it cured him 3 months after he had begun to wear it. We had tried several other remedies and got no relief, and I shall certainly recommend it to friends, for we surely owe it to you.

Yours respectfully,
WM. PATTERSON.
No. 717 S. Main St., Akron, O.

PENNSYLVANIA MAN THANKFUL.

Mr. C. E. Brooks,
Marshall, Mich.
Dear Sir:—

Perhaps it will interest you to know that I have been ruptured six years and have always had trouble with it till I got your Appliance. It is very easy to wear, fits neat and snug, and is not in the way at any time, day or night. In fact, at times I did not know I had it on; it just adapted itself to the shape of the body and seemed to be a part of the body, as it clung to the spot, no matter what position I was in.

It would be a veritable Godsend to the unfortunates who suffer from rupture if all could procure the Brooks Rupture Appliance and wear it. They would certainly never regret it.

My rupture is now all healed up and nothing ever did it but your Appliance. Whenever the opportunity presents itself I will say a good word for your Appliance, and also the honorable way in which you deal with ruptured people. It is a pleasure to recommend a good thing among your friends or strangers. I am,

Yours very sincerely,
JAMES A. BRITTON.
80 Spring St., Bethlehem, Pa.

REMEMBER

I send my Appliance on trial to prove what I say is true. You are to be the judge. Fill out free coupon below and mail today.

TEN REASONS WHY

You Should Send For Brooks' Rupture Appliance.

1. It is absolutely the only Appliance of the kind on the market today, and in it are embodied the pricipies that inventors have sought after for years.
2. Ahe Appliance for retaining the rupture cannot be thrown out of position.
3. Being an air cushion of soft rubber it clings closely to the body, yet never blisters or causes irritation.
4. Unlike the ordinary so-called pads, used in other trusses, it is not cumbersome or ungainly.
5. It is small, soft and pliable, and positively cannot be detected through the clothing.
6. The soft, pliable bands holding the Appliance do not give one the unpleasant sensation of wearing a harness.
7. There is nothing about it to get foul, and when it becomes soiled it can be washed without injuring it in the least.
8. There are no metal springs in the Appliance to torture one by cutting and bruising the flesh.
9. All of the material of which the Appliances are made is of the very best that money can buy, making it a durable and safe Appliance to wear.
10. My reputation for honesty and fair dealing is so thoroughly established by an experience of over thirty years of dealing with the public, and my prices are so reasonable, my terms so fair. that there certainly should be no hesitancy in sending free coupons today.

CURED AT THE AGE OF 76.

Mr. C. E. Brooks, Marshall, Mich.
Dear Sir:—

I began using your Appliance for the cure of rupture (I had a pretty bad case) I think in May, 1905. On November 20, 1905, I quit using it. Since that time I have not needed or used it. I am well of rupture and rank myself among those cured by the Brooks Discovery, which, considering my age, 76, years, I regard as remarkable.

Very sincerely yours,
SAM A. HOOVER.
High Point, N. C.

CHILD CURED IN FOUR MONTHS.

C. E. Brooks,
Dear Sir:—The baby's rupture is altogether cured, thanks to your appliance, and we are so thankful to you. If we could only have known of it sooner our little boy would not have had to suffer near as much as he did. He wore your brace a little over four months and has not worn it now for six weeks. Yours very truly.
ANDREW EGGENBERGER.
21 Jansen St., Dubuque, Ia.

CONFEDERATE VETERAN CURED.

Commerce, Ga., R.F.D. No. 11.
Mr. C. E. Brooks,
Dear Sir:—I am glad to tell you that I am now sound and well and can plough or do any heavy work. I can say your Appliance has effected a permanent cure. Before getting your Appliance I was in a terrible condition and had given up all hope of ever being any better. If it hadn't been for your Appliance I would never have been cured. I am sixty-eight years old and served three years in Eckle's Artillery, Oglethorpe Co. I hope God will reward you for the good you are doing for suffering humanity.
Yours sincerely, H. D. BANKS.

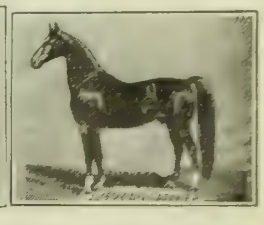
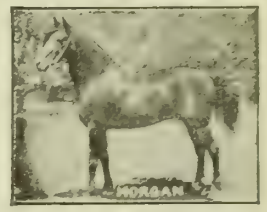
THE AMERICAN BREEDER

A Farmers' Paper, Devoted to the Breeding and Care of Their Live Stock, and the Welfare of Their Families and Homes.

Published Twice a Month. Subscription Price, $1.00 Per Year, or $2.00 for Three Years, Payable in Advance.

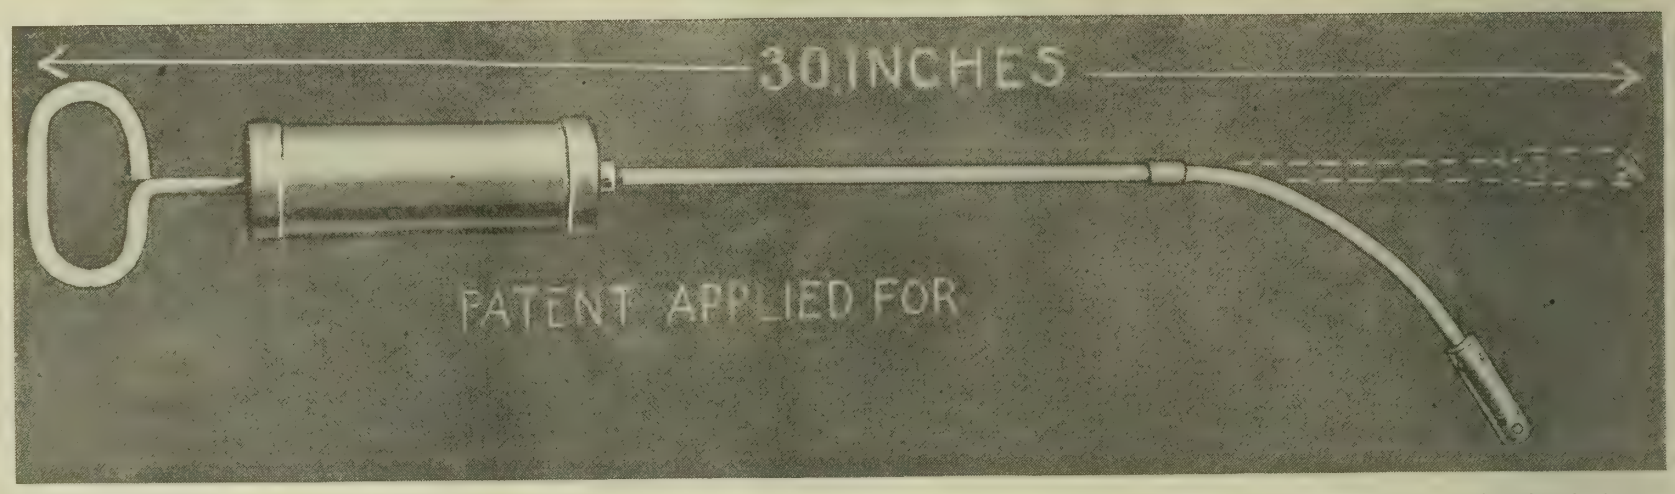
Volume VI. *Kansas City, Missouri, March 5, 1913* *Number 4*





The Making of Good Horsemen.

The best time to begin educating for a practical knowledge of horsemanship is at an early age. These boys are being encouraged to help their father care for the stock. They enjoy it and benefit greatly at the same time, learning much by association. This stallion seems to have the perfect confidence of his master and apparently feels the responsibility of his charge. Notice his intelligent look and his general condition of thrift. In temperament as well as in type he is essentially a draft animal.



Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

BREEDING APPLIANCES OF ALL KINDS

THE IMPROVED CARLSON SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times. All necessary directions will be sent with the instrument.

Special Offer: 50 pointed breeding capsules, price $1.00; a tested hot water thermometer, price $1.00; the improved Carlson semen extractor, price $7.50; **ALL FOR $7.50.**

Microscopes

For use in testing the semen of stallions or jacks. Magnifies 500 times and is used by veterinarians and physicians. Price $35.. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price, $1.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety.

Price, $1.25.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickel plated, about 22 inches long, with a glass tube in it.

Price, $4.00.

SPECULUM.
Made of Good Material, Nickel Plated, Will Last a Life-time.
Price, $3.00.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use.

Price per box (100), $1.50.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6.

Price, $2.00.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 or 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1914. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag.

Price each, $1.00.

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

Horse Breeding Study At Home

The Beginning of the Systematic Instruction in Fundamentals Through These Columns. How it May Be Extended to a Great Class of 150,000 Breeders, Farmers and Others.

For years we have been receiving so many letters and inquiries from breeders who seek more information about their business, but whose farming and stock raising affairs are such that they cannot leave home, that finally we have worked out a plan for giving a regular course of instruction through the columns of the American Breeder. To go further than we have already taken our readers by means of articles on timely subjects in the paper, calls for a systematic course of study, and that is just exactly what we have been working out.

There is less known about live stock breeding than about any other subject in agriculture today. This is especially true with horse breeders. Of each three mares bred in the United States, only one of them produces and raises a foal up to weaning time. Every breeding animal is supposed to be a producer.

Who is to blame? Where have the breeders ever had an opportunity to learn anything about breeding live stock? Printed literature containing plain information on this subject has been refused admittance in many homes. The breeders themselves are to blame for this false modesty. The veterinarians as a rule have not been encouraged to study the practical side of breeding subjects; their time and energy in the recognized colleges have been almost exclusively spent with diseases. Breeders can give this important subject their best efforts without even crossing the boundaries of veterinary practice—a profession so great that its members have not yet found time to specialize in this particular line.

We have hesitated to undertake this most difficult problem, as too many people expect instantaneous results and are not willing to begin at the bottom and increase in knowledge step by step, as is necessary to be a successful breeder. We wish to impress upon our readers the importance of studying these lessons closely as they are presented. Keep them filed away.

As an illustration of the necessity of this school we make mention of "opening mares." The average breeder knows very little about the anatomy of the genital organs. Many of them open the mouth of the bladder instead of the cervix. The average breeder does not know why a mare does not get in foal. The average breeder does not know when a mare should be bred for the best results. There is just one way that these things can be made plain by the use of printer's ink, and that is for the student to begin with the first lesson, which appears in this issue. Study it carefully. This school will cost us a lot of money and a lot of hard work, but if our readers will appreciate it and try to better themselves and their communities, we will consider that the results are worth our efforts.

A lot of special charts and photographs will be used. We should like to ask each of our readers to form classes of ten or 20 or more young men to meet at his place every two weeks as his pupils. There are many stallion owners who will learn more rapidly than others, and who can be instructors in this work and build up among their patrons a wonderful interest in breeding better live stock. These lessons will include a lot of material that has never been in print, and is absolutely new to the world.

There will be no extra charge for this work. We promised our readers when this publication was started that we would give them everything we could, and expected to be of as much service as possible. This course of instruction will be given to probably the largest class of this kind in the world. Nearly 50,000 horse breeders will start with this first lesson; if one-fourth of these start their own classes of 20 or more students, this will bring the total size of the class to in the neighborhood of 150,000.

The first lesson is, as usual, the most difficult. After one gets started and interested it will be much easier. We hope our readers will see the necessity of studying this first lesson thoroughly. The anatomy of the genital organs must be understood before going further on breeding subjects. One who does not understand this anatomy is not in a position to learn much about horse breeding.

We will soon take up infection, so that breeders can put themselves in a position to prevent much of the disease. A prevention is always better than a cure. It is always cheaper and safer, but if a breeder does not understand infection he is not in a position to prevent the difficulty.

We ask those who take part in this work not to be discouraged, as some, no doubt, will say that they cannot learn the terms, it will be necessary to use in order to be exact. There are not many big words, and we would suggest that each student get on friendly terms with a veterinarian or a physician who can give him the correct pronunciation of these words; say them over in unison a few times so that they can be spoken easily and correctly.

One can take this course at home and study it without being embarassed; if he makes a mistake, no one need know it. Any breeder who will study these lessons carefully can increase his business because he will understand his work and will be saved making many worthless services. Those who use only the natural service need this information much more than those who are able to use the capsule system. When the natural service is employed each and every service must count in order to make it profitable. When capsules are used and a number of mares bred at one service, more chances can be taken on breeding a few doubtful mares. Breeders cannot estimate the value of this school; it not only means money to them, but those who follow its instructions carefully will be leaders in horse breeding and in the up building of their communities.

Everything printed in the American Breeder from this on . . e closely copyrighted, and every line will be protected so that it cannot be reprinted anywhere else. Those who expect to get the benefit of our investigations can expect to get it only from the American Breeder. It matters not what kind of a stallion or jack or other breeding stock one may own; these lessons are valuable to him because we can make it profitable enough for him so that he can buy the best. The low per cent of foals secured is one reason why so many breeders use inferior stock. Another reason is that the mare owners have not been shown the necessity of using better sires. The owner of good stallions or jacks could not do any better than to have as many of these mare owners as possible formed into a breeding class and get them interested with him in this work. He will be prepared to explain to them why certain mares are not profitable as producers, and gradually eliminate from his territory the undesirable mares. He will be surprised to know how much interest the mare owners will take in this work. The average individual has little idea as to how conception takes place, or, in fact, little definite idea of anything else connected with horse breeding.

One objection to a school of this kind, or any other progressive movement, is that some who own breeding stock think that they cannot learn anything more. There are many of this kind. Some of them own good stock, but are doing more injury to the breeding business than the intelligent men can repair. A lot of these breeders have never read anything about breeding. Ask one of these individuals a question and he says, "Oh, just because."

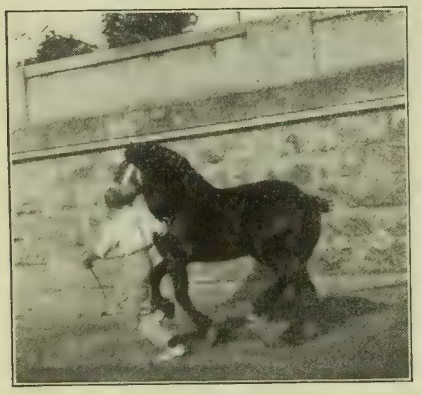
It is necessary to study these lessons carefully in order to understand other literature. Those who have not had an opportunity to get familiar with these terms cannot get interested in reading material when technical terms are used; they do not understand the meaning and consequently interest is soon lost in the subject. But most of the leading horse breeders in this country are going to grasp this great chance. It means a wave of education that will be noticed all over the country where horses are raised or used. Practically every community where horses are bred will feel the effect of this information. Those who fail to grasp this opportunity can blame themselves only. How will a horse breeder feel when some other breeder asks him a few simple questions that he cannot answer? That is the proposition exactly. Are these men going to sit back and live in ignorance all their lives? Stallion and jack owners know less about their business than any other class of men in America. This is the time to get busy. No one can afford to be a back number.

Stallion and jack owners are going to start large mare owner classes so that this education will be a necessity. A lot of the mare owners throughout the country will become expert horse breeders. What will a stallion or jack owner do when he comes in competition with one of these intelligent men who understands the breeding business?

Nearly every day in the year this office receives a communication from someone asking for printed literature on this subject, and especially the anatomy of the male and female animals. There is practically no literature printed in plain enough terms for the average stallion or jack owner to understand. What they want is this preliminary work that will explain everything in the plainest of language, so that they may get a start. It is just as necessary that this information start at the bottom as it is for a child to learn his A, B, C's. A lot of farm papers are going to be forced to print information on this subject so that the mare owners will know something about it. Those who have been posing as experts from this time on will be required to answer questions and make certain explanations that will call for real knowledge. The mare owners throughout the country are not getting enough colts and they are going to study mighty hard; they are looking for literature on this subject that will help them. The stallion or jack owner that sits back and does not try to improve his condition is going to be a back number. This is going to be the big year for education among horse breeders.

We want every progressive horse breeder in the country to telephone his friends and ask them to join with him in this horse breeders' school; visit them in their homes, or at gatherings, or in town on Saturdays. Do this now and get them enlisted immediately so that they can get this issue of the American Breeder containing this first lesson and start now.

We are making a clubbing offer of 75c a year for clubs of four or more. Regular subscription price $1.00 per year or three years for $2.00 . There are not many mare owners who would not be glad to get in on this proposition. If they are not able to meet with the class at the regular time the paper will go to their homes where they can study it and review a little at the next class so that they will not miss out. This affords the greatest opportunity that breeders have ever had to be associated closely with their cus-



See Page 6 For First Lesson

In Horse Breeding

The American Breeder's School

tomers, and at the same time build up a great interest in breeding live stock. Nearly every breeder can find 20 or more men who will gladly go in on this proposition. This not only includes mare owners but merchants, physicians, veterinarians, blacksmiths and others who would be glad to join this course. This will be the first time that this instruction has ever been printed in a way that ordinary men could understand it. All new members who expect to join this class should send their subscription in as soon as possible.

In the last issue of this paper we asked our readers how many of them would appreciate this work by pledging themselves to add ten or more new subscribers to the American Breeder this year. We have been more than surprised at the widespread response to that proposition. Nearly every letter that reaches this office has stated that the writer could be depended upon for ten or more new

An Ardennaise stallion weighing about 1700 pounds, and very active. These horses are found on the frontier between France and Belgium.

subscribers. The great majority of these letters have come from the most successful horse breeders in the country, who are seeking more information on this subject. They realize every day that they need something more and that we are in a position to supply this knowledge.

This school will be under the supervision of the editor, Frank B. Graham, who has studied scientific horse breeding in nearly every district in the world where good horses and jacks have been bred. He has made more scientific investigations along this line than any other living man. He has had at his command a corps of the best scientific men in the country. These investigations have cost a fortune. He now intends to give this information to the breeders of live stock for the asking. His practical experience as a horse breeder, as well as his association with thousands of other horse breeders, places him in a position to be of untold value to the breeders.

WATERING HORSES AND JACKS.

Fresh water at regular intervals is just as necessary as having the right amount of feed at the proper time. Animals which do not consume a reasonable quantity of water are not in their best physical condition; their bodies are feverish, which usually leads to constipation. If an animal is not drinking enough water a little salt may be added to the feed until a reasonable quantity is taken into the system.

Every valuable animal should have its own particular water vessel so as not to carry any infection from one animal to another. Common water vessels frequently are the means of conveying diseases. Some animals will not drink out of a new vessel or one that they have not been familiar with. This is especially true with jacks; frequently they will go for days without drinking, if a new or peculiar looking vessel is provided. Jacks get out of condition quicker by not having their water regularly than from almost any other cause. A great many jack sores might be prevented if the jacks were kept in a better physical condition—they need more fluid in the body. This is especially true when feed of a heating nature is given.

CAPSULE BREEDING OPPOSITION.

There was a time when a lot of breeders who were producing pure bred stallions for sale, thought that the capsule system would be injurious to their business. They were of the opinion that one stallion would be able to accommodate so many mares that the sale would be greatly restricted. Some of these breeders have found that their best customers are those using capsules.

Hundreds of stallions have been purchased during the last year for more than $2,000 each; quite a few of them have brought over $4,000 each. More high priced stallions are sold to capsule breeders than to all of the other breeders combined, because they can make it profitable to own the good ones. It makes an outlet for the good ones and this demand is only in its infancy. Just as rapidly as it is made possible for a stallion to be profitable there will be plenty of men ready to engage in that business. There are thousands of localities where good stallions are needed. All the breeders need is to understand that they can make money. Those who have been so short-sighted as to fight the modern methods have been injuring their own future.

Where a stallion is able to accommodate a large number of mares the price can be made cheap enough to compete with scrub horses, so that the better animals are not interfered with. The capsule method of breeding has come to stay and a great many of the large breeders are now using it and advocating it because they have confidence in it. They have been shown.

There is another class of men who are opposing the modern methods in horse breeding. These individuals do not happen to be the originators of this particular method of breeding. They are jealous of its success and are doing everything possible to destroy the confidence of men interested in this plan of breeding. But there are so many of our followers who are ready to stand up in any company and fight for this system, that we do not expect much opposition in that direction.

But the most disgusting individual who is fighting the modern method of capsule breeding is one who has heretofore made a fortune out of selling breeders' bags, impregnators and a lot of "dope" that had no value except that it paid a wonderful profit to him. This individual has placed on the market an extractor and uses with his advertisement a photograph of the Carlson Semen Extractor and guarantees it to be the best one on the market. The extractor which he is advertising is not a success. We do not believe he ever intended it to be a success, but just one of his smart plans of deceiving the public and helping to destroy the modern methods in order that he might convert the people back to his old method of selling goods at a great profit. This is the most contemptible method of doing business. Just so long as the breeders are misled by these "grafters," not very much progress can be expected. The extractor put out by this individual looks like a play thing. There is very little suction in the syringe; the body of it is made of very light material so that it will not maintain an even temperature. His guarantee may be good, but after he gets the money it will be up to him whether he returns the cash or not. In all probability he will want you to take some more of his "dope," and in the end the purchaser of that extractor is disgusted with the capsule system. This is a very smooth proposition. We believe a "word to the wise" is sufficient.

SERVICE RECORD BOOKS.

Many breeders require their customers to sign notes. Their record book has a note attached with provisions in it. We have come to the conclusion that, as a rule, the note attached in a service record book has very little value. A note is not any better than a common account. The service record book without a note is a book account. If a note is taken it releases all other claims in law, so that if there is a lien law it has no effect because that debt has been settled with a note. At least this is the view that numerous lawyers have taken. If a note is taken it should be on a regular form without any provisions in it so that it can be transferred. These blank notes can be obtained at any bank for the asking.

After studying this subject carefully we have decided not to encourage the signing of notes unless the stallion or jack owners can have enough signers on the note to make it absolutely good. There is usually a lot of good business lost by forcing customers to sign these notes. There are not many breeders who are able to get their notes signed, anyway. Several states will have lien laws this spring so it is not advisable to accept a note and release the mare and the colt. The American Breeder has both kinds of books for sale, one being the old kind that we have been selling for years, with a note attached.

At the request of many breeders the subject of a new service record book was brought up and these men have given their suggestions as to the best plan for a book of this kind. The result of their and our experience has been combined in a new service record book. This book is not any thicker than the old book, and it is shorter. It can be carried in the hip pocket, or coat pocket, or shirt pocket. It is very small and convenient to carry, yet it is complete in all its details. It has room for 200 mares; each mare having a complete page. There are 20 index pages, all in alphabetical order so that any mare can be found quickly by turning to the index. It has a gestation table, also a calendar, and a good water proof cover. It is printed on good paper and the smallness of it makes it convenient to carry during warm weather when the breeder does not have on many clothes. It can be used for several sires without carrying more than one book at a time.

Every breeder should have one of these books because it is accurate and makes it easy to record the mare quickly. An exact form can be seen in this paper. Either the new or the old book can be had from the American Breeder, 225 West 12th St., Kansas City, Mo., for 50c each. This new book is absolutely the best and the cheapest book on the market. If the purchaser is not absolutely satisfied with it in every respect, he may return it at our expense and get his money back.

RELIGION AMONG HORSE BREEDERS.

There may have been a time when the owners of breeding stock were not of a high moral character, but if that time ever did exist it is now changing. A lot of horse breeders are religiously inclined. It is surprising how easy it is for a movement of this kind to get started with just a little encouragement.

At the December term of the Graham Scientific Breeding School the instructors urged those present, and especially the young men, to lead good, clean lives. A little later on an opportunity was given to the students to speak on better living. W. H. Hanna of Tontognay, O., delivered one of the most impressive short addresses the writer ever heard. He also led in encouraging others to speak and the meeting resulted in four conversions to Christianity. Other good, short speeches were made. Mr. Hanna may never know the value of his work that evening. What this world needs is more men like Mr. Hanna who are not afraid to stand up for what they know to be right.

At the January term of school this same spirit manifested itself early in a meeting in which Arthur Colegrove of Girard, Kas., took the lead. A number of speeches were made. There were 83 men present and about 20 men were converted to Christianity that one night. These men were of various ages, the youngest being about 21 and the oldest 61 years of age. This was the most stirring meeting the writer ever saw, and everyone present was amazed at the results.

At the February term of the same school, there were in attendance about 130 men; about 75 of these were religious. Mr. Lewelling of Beaver City, Neb., took the lead in advising others to take a more advanced stand in the matter of religion. This meeting re-

A Nivernaise horse ready to be shown in the ring at Paris.

sulted in 17 conversions in one night. These conversions have been the most complete the writer ever saw.

The Graham Scientific Breeding School is an institution where a large number of breeders assemble and are instructed in horse breeding for one week. The instructors in this school are men of high moral character who encourage a cleaner life and show the necessity of being men among men, and the dangers from certain diseases. It is also pointed out that a man who lives a clean life will live longer and be happier. One night in the week, after the lectures are over with, the balance of the evening is devoted to the subject of better living. The meeting is turned over to the breeders themselves to conduct as they choose. They handle it in such a way that many of them make a start they would not make at home. This shows the value of men who are willing to speak for the truth in any class of men, and the great necessity for men of this kind. At these meetings no one is ever embarressed by having all the Christian people stand up all around them; they are never classified and anyone can sit in one of these meetings without embarrassment whether he cares to take any part or not. Not only that, but the example is set in the way of right living. The results of these meetings have been wonderful and we wish there were more of them. It is safe to say that no individual who was present at any one of these meetings returned to his home without being a better man.

To the American Breeder: Please discontinue my ad as I am so nearly sold out. Have sold close to 25 head already this winter. Am very pleased with your paper. I think it is one among the best. I thank you very much. I hope to do more advertising later on. Wishing you success, I beg to remain your friend. — John W. Waddill, Adair County, Mo.

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

AZOTURIA—What is the matter with my mare? Yesterday I worked her about three miles to wagon with light load; got within one-half mile of home when I noticed she was sweating more than necessary. I stopped a moment and when I started she seemed to be stiff and I could hardly get her home; when I turned her loose she was so stiff I could hardly make her move, and it seemed to hurt her to move, especially in the right shoulder. I gave her some hay and she ate and drank just like there was nothing wrong. She isn't near so stiff but seems to be sore but is still hearty. The mare is ten years old; weight about 1500 and she is bred to a $3,000 Hackney horse. Is a valuable mare; is almost too fat to work but is used to work, as I make a regular farm animal out of her. If you can tell me the trouble and give me a remedy I will appreciate it.—Texas Subscriber.

REPLY.—Your description is a very accurate one of the symptoms of azoturia and you are fortunate in having the case terminate favorably. The fat, well kept animal that has stood in the barn a few days on full feed is a frequent victim of azoturia. The handling of such cases would be largely from a preventive standpoint as medical agents are quite unsatisfactory in the really serious cases. An effort should always be made to provide exercise during periods of enforced idleness and a substantial reduction of the grain ration is always in order during this period. It is a disease that affects the muscles primarily and when severe enough to cause the horse to go down through inability to use the affected muscles, often results in death.

CATARRH OF THE BOWELS — I have a stud colt coming two that very often gets very loose in his bowels. Had a bowel trouble when about three months old caused by eating too much grain; came very near losing him. His feed is one gallon oats with one ear of corn and corn fodder for roughness. Very often have to cut his feed down on account of diarrhoea. He was not bothered any last winter with diarrhoea, but has been giving trouble this winter ever since I began feeding dry feed—West Virginia Subscriber.

REPLY:—Your colt is becoming a victim of chronic indigestion on account of the bowel derangement. You will have to make a careful study of the feed that best agrees with him and deny him access to such as appears to disagree with him, otherwise you will have a worthless animal in the course of time. Clean, bright oats ordinarily serve as at least a part of a good, wholesome ration for the horse kind. To this can be added some wheat middlings or a low grade of flour, old process oil meal, etc. Clean, bright prairie hay in the way of roughness usually serves best to overcome the irritable state of the bowels. Give one-third teaspoonful of dried sulphate of iron with a teaspoonful of golden seal in the feed three times a day.

STALLION PREFERS DRIVING MARE—We have one of the best Belgian horses in Western Iowa, but he is so slow. He will get ready for a driving mare but does not seem to care for a draft mare.—Iowa Subscriber.

REPLY:—There are conditions under which stallions have cause for making a choice in mares. We do not know just why this particular stallion should select driving mares, but a light mare could be used to get him ready for one of the thicker kind until the season is farther advanced, when it would be advisable to gradually do away with the light mare. If your breeding pen was absolutely dark you might make the change better so that he could not see the conformation; he would then be guided by the scent. We would also advise getting a draft mare that was in foal and keep her tied somewhere near this stallion so that they would get acquainted. Try to get a mare that is not too cross—one that he will take up with.

CHRONIC COUGH — I have a mare ten years old due to foal soon; has always been a good brood mare and for about two weeks she has had a cough; at times she coughs pretty bad, and every time she coughs the water just flies; don't seem to have any control of it. Do you think she will deliver the colt O. K.? She is bred to a jack.—New Mexico Subscriber.

REPLY:—It is just likely that your mare will carry the colt to the proper time and deliver it without mishap, but the matter of the cough should receive your attention. Cough is dependent upon a great variety of things and is only a symptom of disease at some point. You should have a good veterinarian examine your mare carefully and advise with you how to overcome the difficulty.

SERVING TOO MUCH—I have a Percheron stallion that will be 18 months old March 11 and weighs 1450 pounds. I intend to break him and use him a little for light work. I thought of starting breeding May 1. How many mares can he serve? Will two covers a week be too many? How should he be fed to get the best growth?—Iowa Subscriber.

REPLY:—You will have better results with this colt if you will keep him growing nicely another year without any service. He might make a few services this fall. Twenty months of age is too soon to start a stallion in service. Your colt has grown rapidly and he will be very soft; if his masculinity is aroused he may fret and worry to the extent that he may not develop as you are expecting him to do. You will find it very profitable to break this colt to work, but be very careful not to give him too much of it. Remember that he is a big, overgrown colt and will be easily injured; just work him enough to break him; do not try to perform any labor with him. While you are working this colt you should have only one thing in view and that is "breaking a stallion." From the weight you have given for his age we would not advise you to make any change; keep him growing just as you have.

ROARER—I have a four year old unbroken horse, a very bad roarer; caused by distemper two years ago. I saw in your paper an answer to a similar case saying an operation would be necessary. Now we haven't a very skillful veterinarian in our county, but as the horse is useless we wish to operate on him. I mean the veterinarian is quite skillful but has never had a case of this kind. If the horse is led on a walk he checks up and roars loudly; is distressed and gets entirely out of wind. Will you kindly describe the operation for a case of this kind. Is there a growth in the windpipe which shuts off the air? And can it be removed surgically? Will it be necessary to open the windpipe? And will this be safe if it is sewed up again quickly?—Colorado Subscriber.

REPLY:—If your veterinarian is a graduate he should know how to operate on a case of this kind, otherwise he has no business meddling with this case. This is an operation that must be skillfully done in order to secure results and if crudely done will mean disappointment and perhaps death of the animal. We would judge from your description that you have a very bad case and unless a competent man undertakes the task with an appreciation of just how the case should be handled, there is grave danger of the horse choking to death before the real surgical operation is begun.

MORE "FOGY" NOTIONS — I have two young Percheron mares that will be three years old this spring; weight 1400 pounds each. Which would be the most advisable to breed to, horse or jack, for safety of mares at foaling time? Also is it any harder to get a mare in foal by the horse after being bred to jack for first colt?—Kansas Subscriber.

REPLY:—It will not make any difference whether your mares are bred to stallions or jacks so far as difficult parturition is concerned. One is just as safe as the other. If your mares are allowed their freedom so that they may take exercise as they desire up to foaling date, little difficulty should be anticipated at foaling time. It will not make any difference whether your mares are bred to stallions or jacks so far as future fertilization is concerned. Occasionally a stallion owner who wishes to injure a competitor who owns a jack will start a "fake" story to further his own interests.

LAME COLT—I have a mule colt nine months old which became lame in one hind foot at about three weeks old; can't tell whether the mare stepped on it or not. It was not very lame at first but now it limps considerably when on hard ground. Its heel is contracted some and the top of its hoof is inclined to curl up just a little. Now there are chances that it might have been foaled that way. Do you think there is anything I can do? I have put a light shoe on it in order to give the hoof its proper shape; that's about all I have done for it. The shoe has been on about three weeks. It seems to use it some better than before shoeing—Oklahoma Subscriber.

REPLY:—It is very likely that your colt was injured in some manner, for you state that it became lame when about three weeks old. All cases of lameness should be studied very carefully before attempting treatment so as to be sure the nature of the lameness is understood and properly located, otherwise valuable time will be lost in the treatment and may be submit the animal to unnecessary pain during the course of attempted cure. We can give you no better advice than urge you to have a qualified veterinarian first examine this colt that the treatment be intelligently inaugurated.

Suffolk horses shown at the Royal Agricultural Show in England.

SLOW STALLION—We have an excellent Belgian stallion that it is nearly impossible to get a service from, but when he does serve he nearly always gets a colt. His colts are exceptionally good and we are very anxious to get him out of that habit. We would certainly be grateful for any information that will give us satisfactory results.—Montana Subscriber.

REPLY:—Take the feed away from your stallion or at least half of the grain, for about 24 hours; give him two miles of exercise so that he will not jump around too much when he is turned loose. Get a mare in good heat, one large enough to hold him up and one that will not fight, and turn them loose together in an enclosure. Be careful that the stallion cannot get out. Do not have the enclosure too large where he can run and hurt himself when he is not used to it. Just let the two run together until he serves that mare. After he has made a service take him away then make a little pen in the corner of your breeding enclosure so that you can put the stallion in there and turn him loose. The next day bring the mare in in front of this pen a few feet and open the door of the stallion's pen. Do not have a whip unless you think you will need one; let the stallion make the service loose. Be very gentle with your horse all the time so that he is not afraid of you; be very gentle with him while making the entrance. Do not try to breed any mares with a sunken rectum if he has a long or large penis because you are liable to have trouble with him and you cannot stop him. This is getting to be a very popular way of making a service, either with a stallion or jack, especially if they are a little timid. Your stallion has probably been handled severely with a bad bridle. Do not try to make too many services with him to begin with. After he has had his play and there is no danger from the extra exertion, he may be put back to his regular ration, but gradually increase the grain ration to oats exclusively and diminish the hay ration so as not to have too much of a bulky body. Oats will make him more keen.

RHEUMATISM—I have a very large fine jennet that is due to foal soon. She has had rheumatism for a year. Her tendons are very large and badly knotted between the knees; her ankles are cocked over so badly that she is almost helpless. What can I do for her?—Illinois Subscriber.

REPLY:—It is very likely that you are correct in your diagnosis and the case is sufficiently bad to warrant you in employing a veterinarian who can give personal attention to the case. These subjects become aggravated as a rule during advanced pregnancy, and upon giving birth to the foal frequently rapidly improve. It is perhaps advisable inasmuch as the foaling period is close at hand to do nothing until after that date with medicinal agents, but you should look after the general comfort, house her from inclement weather, and furnish her nutritious diet. Such animals are quite helpless and should be given additional good care over their mates.

ANATOMY OF THE MALE AND FEMALE ORGANS—Will it be possible for me to secure a book of you dealing with the anatomy of the male and female organs of horses? If so, write price of same.—Texas Subscriber.

REPLY:—There are no books printed on this subject that is plain enough for the average breeder to understand. The proper thing for you to do is to join the American Breeder School and study the first lesson which appears in this issue, then you will not only learn the anatomy of the genital organs, but you will learn a lot of things about horse breeding. The anatomy, however, is the foundation for all breeding subjects. Without this information advancement would be very limited. The anatomy of the female is the most important. This will be given in April 5th issue, with other lessons following regularly.

COLOR OF SEMEN — What is the color of a stallion's semen? Should it be thick or watery?—Alberta, Canada, Subscriber.

REPLY:—Semen is usually about the color of the white of an egg—sometimes a little more yellowish. It matters not what color it is, or how thick, as far as the results are concerned. There is only one way that you can tell whether the semen is good or not, and that is through the use of the microscope. A microscope of 100 diameters can be used, but 500 diameters is better.

LAME STALLION—I have a standard bred stallion that is lame in his right hand leg. He was hurt about two years ago by being struck by a bull. When he travels far he goes pretty lame, but when he stands, doesn't show it. There is no swelling or heat anywhere in the part but seems to be in the flank mostly. When he steps sideways he favors it more. He steps as though it might be a spavin, but I know it is not. Could you tell me some liniment that would help but would not blister?—Colorado Subscriber.

REPLY:—It would be improper on

The American Breeder's School

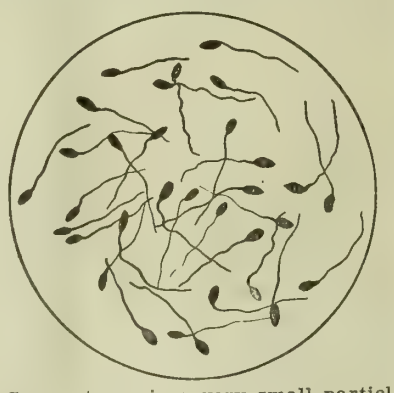
Horse Breeding---Lesson I

Anatomy of The Male Generative Organs

(Frequent Reference to the Drawings Should be Made Studying this Lesson.)

In taking up the study of any subject it is first needed to have an understanding of the nature and scope of the subject studied in order to fully understand the matter presented.

Anatomy for our purpose deals with the structure, form and relation of the component parts of the animal body. It deals with cold facts as they are found. Shape and structure are studied without any regard to the function or purpose of the parts. Anatomy is shorn of action for action or function comes within the province of physiology. Anatomy is necessarily the foundation science, for a correct knowledge of the parts that make up a machine is required before a perfect understanding can be had of its workings. Physiology, then, deals with life and its activities while anatomy has to do largely with the dead subjects. A study of the two subjects go closely hand in hand and are properly intimately related. In fact it is difficult to discuss the one without encroaching more or less upon the other. No great attempt will be made in this series of articles to follow closely the confines of the subject as the presentation will serve its purpose better if references are occasionally made to the related branch.



It shall be our purpose to restrict our discussion to only such anatomical parts as concern our special study, namely—the generative organs. These parts can be studied and investigated independently of the remainder of the animal body without difficulty and a few facts well learned will be far more advantageous to those who follow us than a superficial smothering from an attempted general knowledge of the entire structural body of the horse.

In the propagation of a species like the horse, Nature has delegated certain cells for that special purpose. It is interesting to know that nature arranges her work with considerable division of labor, each task of which is assigned to cells of a certain type. In the evolution and development of the body through growth, cells are caused to take on certain forms that best suit them for certain special work. Examples of this lie in the muscle cells whose office it is to contract, in the nerve cells whose function it is to convey impulses in the outer covering of the body—the skin whose mission it is largely to protect and in this process of specialization there is developed both in the male and female bodies certain special cells whose function it is to propogate the species or kind.

In the female one single cell, the ovum, is developed at a time. In the male thousands are developed for the same purpose. The student of artificial insemination hopes to take advantage of Nature's generous and seemingly wasteful method by effecting several divisions of the ejaculation of the male and by careful practice introduce a portion into the generative tract of a number of females and thus perform all that Nature can ever do, and produce several foals where only one was produced before. There is nothing mysterious or unreasonable about the method, for even after numerous divisions of the ejaculated mass from the stallion, there is still wasted hundreds of male cells, for the reason that only one is required in the fertilization of the cell from the female.

The cells that are elaborated in the male body are known as spermatozoa and they are developed in the testicles. A spermatozoan is a cell so small that it requires a microscope to detect it. It is about the 1/25,000 of an inch in diameter and in its fully developed state it has an appendage, or tail, attached to one end of the cell, which enables it to move from place to place. This is a necessity in a cell possessing the function peculiar to it, for it must, as it were, search for and find the female cell in order that fecundation may take place, and inasmuch as it is deposited at a point rather remote from the place where it ordinarily meets the female cell it must traverse quite a space before union of the two can occur. This property of possessing ability to move from place to place is highly important in spermatozoa and the value of a stallion can be largely measured by the activity—his cells show under the microscope.

The spermatozoa are developed in the testicles, two glands that are located in a sack called the scrotum, between the thighs of the horse. The scrotum is made up of several layers which are only modifications of the muscles and tunics that compose the abdominal wall. The outer covering or skin is soft, thin and velvetly and covered with short fine hair and shows a well defined line in its middle running in the long direction of the animal, which is called the raphe. The testicles, two in number are separated from each other by a partition consisting of a certain arrangement of the walls of the scrotum. The scrotal sac communicates with the larger cavity above, containing the bowels, by means of a constructed passage-way which is known as the inquinal canal. It is through this canal that the blood vessels pass to and from the testicle and the secretion or spermatozoa are permitted to pass upward through a special duct. The

Spermatozoa in a very small particle of semen, magnified about 1,200 diameters.

nerves and other important structures reach the testicle through this same passage-way and sometimes when the canal is unduly large or certain positions are assumed by a stallion the bowels or loose fat may pass into this narrow canal where from being compressed, disturbances in the way of serious inflammation usually follow, resulting in loss of life unless prompt relief is given. At the point where the inguinal canal opens into the scrotum below is spoken of as the external abdominal ring while the corresponding point above at the entrance of the abdominal cavity is known as the internal abdominal ring.

The testicles during the early life of the unborn colt are not found in the scrotal sac but are located back of the kidneys under and to the outer side of the backbone or vertebra. A provision is made by means of which they are caused to be drawn in the direction of the internal abdominal ring from which point they may descend through the inguinal canal to the scrotum below. A failure of the cord that operates to guide the testicle to its natural destination results in the testicle remaining in the larger cavity containing the bowels, establishing a condition termed a ridgling. The testicles in such cases shares in the defect and as a rule are small and illy formed, which accounts for the fact that the great majority of ridgling horses are not breeders. This statement is made with the understanding that the breeding is dependent upon testicles that are within the abdominal cavity.

The testicle is invested with several coats, the outer one being smooth and shiny and is a continuation of the large smooth sheet that clothes the bowels on their outside and lines the larger cavity containing them.

Beneath this coat is the true envelope of the testicle (tunica albuginea). This coat is a dense fibrous structure, strong and resisting and is reflected into the gland from various directions so as to divide it up into numerous tabules. These tabules or compartments number from two to three hundred, and within these is found numerous convoluted tubules that are the places where the male cells or spermatozoa are developed. There is still another inner inverting coat of a thin fragile nature made up chiefly of many small blood vessels that are concerned in supplying the gland with blood.

The convoluted tabules (tubuli seminiferi) begin within the testicle, near its outer circumference in a blind end and proceed in wavy lines in a common direction where all the tubules emerge from the testicle in straight lines (vasa efferentia). These several emerging vessels continue and form a structure immediately above the gland called the epididymis. The epididymis has at its anterior (front) end an enlargement called the globus major and posteriorly (at the rear) a smaller enlargement called the globus minor. The vessels that largely constitute the epididymis gradually unite until only one vessel remains, which is called the vas diferens.

The vas diferens continues upwards through the inguinal canal, passing the internal abdominal ring and turning backwards, is continued as the ejaculatory duct. The vas deferens is the canal through which the spermatozoa by means of the viratile action of the appendages or tails, reach a point where they may rest until such time as copulation takes place, when they may be discharged through the ejaculatory duct into the uretha (that tube in the penis) from whence they may be projected to the exterior. The vas deferens is considerably dilated at its upper end, which serves as a receptacle for the cells until such time as they may be discharged.

At the same time the spermatozoa may have access to neighboring pear shaped receptacles (vesiculae seminoles) which lie a little back of and above the bladder. These receptacles not only serve as storing places for the spermatozoa but secrete a fluid which is instrumental in promoting the activity and life of those cells.

Proceeding backwards we find the prostate gland, an irregular shaped structure that consists of one central and two lateral lobes. The prostate gland secrets a fluid that is discharged into the uretha at the time of copulation, and becomes mixed at that time with the spermatozoa and fluid from the vesiculae seminoles. The amount of fluid secreted by the prostate varies greatly and a stallion may ejaculate more than the normal quantity of semen and yet be sterile. Over use may stimulate the prostatic secretion and diminish the number and activities of the spermatozoa.

Two pear-shaped bodies lie just back of the prostate, and like them open into, and discharge their secretions into, the urethal canal. These are called Cowpers glands and they secrete a rather thin alkalin fluid whose function it appears to be to lubricate the urethal canal in advance of the discharge previously alluded to.

It will be seen that semen is made up not only of the vital cells of the male (spermatozoa) but of secretions from several glands. The latter serve the purpose of providing fluids in which the cells are bathed, while prolongs their life and adds to their power of motility. It is quite impos-

sible to estimate how long a spermatozoa will live under the favorable environment of the female genital tract, but there appears to be good reason to believe that it is not impossible for them to retain their vigor under these favorable surroundings from one heat period to another. In less unfavorable conditions outside the animal body it has been demonstrated that they will show activity for as much as eight or ten days.

The uretha is a membranous tube extending from the neck of the bladder to the exterior. It serves the purpose of being an outlet not only for the semen but of the urine. It proceeds backwards from the bladder, makes a turn downward beneath the anus and becomes directed forwards where it is surrounded by the penis and extends the full length of that organ. Its termination is that portion that is exposed to view at the end of the penis. The urethra is surrounded by a muscular wall made up of circular muscles which perform a rhythmic contraction during the process of urination or ejaculation and expel whatever may be within the canal, with considerable force.

The penis is an organ that is chiefly concerned in copulation. For this purpose it is so constructed anatomically that it may be erected and lengthened. It is composed of a peculiar tissue, so arranged that it may be promptly distended with blood. Its component parts are surrounded by a dense, fibrous envelope which latter is re-

flected into the organ thus dividing it up into numerous small compartments, or lobules. In the process of erection these lobules become quickly distended with blood, resulting in erection. This act would not occur were there no arrangement provided for ready escape of the blood from the organ. Certain muscles are arranged across the course of the outgoing blood vessels which become contracted during the process of erection, thus hindering the outflow of blood and so long as they are tensed just that long will an erection be maintained.

The next lesson, in the issue of April 5, will be on the anatomy of the female generative organs. This will be even more interesting to horse breeders. Other lessons will follow on physiology of the male and female organs. We hope our readers will bear with us in the first two lessons, as the study of anatomy is the dryest and least interesting feature in a course of study. The average breeder may not see the necessity for studying these lessons carefully, but it is just as necessary to learn these lessons as it is for a child to learn its letters. If our readers will start with this issue and get interested, excellent results will be obtained from these lessons. If there are any terms which are not understood we will be glad to have our readers make inquiry about them so that we can furnish the necessary explanation.

Having read carefully through this lesson, one or more times, the student should now ask himself the following questions and find the answers thereto from the text and the accompanying drawings:

No. 1.—Why is it necessary first to learn the anatomy of the genital organs?

No. 2.—What do you learn in studying anatomy?

No. 3.—Name the different substances which go to make up the semen of a stallion.

No. 4.—Is the fertility of a stallion determined by the quantity of semen discharged.

No. 5.—If not, how is the fertility determined?

No. 6.—What substance in the semen is absolutely necessary for the fertilization of the female cell?

No. 7.—In what gland (a) is this vital substance produced? (b) What part of this gland?

No. 8.—What is the vital weakness in "ridgling" stallions that seems to be responsible for their frequent failure to breed?

No. 9.—How many parts of the male generative organs can you name?

No. 10.—What parts normally pass through the inguinal canal?

No. 11.—What other parts may enter this canal and cause trouble?

No. 12.—What part of the fertile semen has the power of self movement?

No. 13.—Why is this power of movement necessary?

No. 14.—Name the glands producing the other substances found in semen.

No. 15.—Describe the Vas Deferens and tell what two parts it connects.

No. 16.—Give the use and location of the urethra.

No. 17.—How are fluids propelled through the urethral canal?

No. 18. How is the penis charged with blood in order to cause its erection?

No. 19. How many spermatozoa are required to fertilize the female cell?

No. 20. Trace the spermatozoa from the place of its formation to the point of its discharge from the generative organs, naming the parts through which it passes.

BARREN MARES.

Those who have made a close study of their service record books find that a certain number of mares have caused them the most expense with the least profit. Mares which are served with the natural service several times during one season without any results, are not profitable. The method of insuring a colt to stand and suck invites these mares to be bred without much restriction. This is the only country, where horses are bred extensively, that does not charge a certain amount when the service is made. Practically every mare that can be bred is being tried. The present high prices and the bright prospects for the future in horse values will encourage this practice. In years gone by those owning mares which failed to conceive after one or two trials, usually considered their time worth more money than the chances of getting a colt. The limit has been reached in breeding every mare that is presented for service.

We announced a year ago that an organism had been discovered which was responsible, in our opinion, for making many mares barren. This work has been carried on farther and many experiments have been t
We are now convinced beyond any question of doubt that these germs can be transmitted from a diseased mare to a clean, healthy mare for several days after copulation with a diseased mare. These germs do not seem to cause the penis of the stallion to get sore, and this is perhaps the reason that this discovery was not made sooner. About the only injury connected with this is that of the mare.

A statement concerning the investigation and discovery of this organism, and the results obtained, has been sent to nearly every graduate veterinarian in the United States. So far it has not been questioned. We do not yet know how serious this condition is, although our investigations covered several states. The condition which these germs produce is very unfavorable to fertilization. So far as we have learned not a single mare has been fertilized for a considerable length of time after being inoculated. It is our opinion that a majority of these mares will not get in foal for at least a year after being infected, and many of those are made barren permanently

It is amusing to hear some individual say there is nothing to this; that he has settled mares under any and all conditions. Any individual who would make a statement like that knows about as much about scientific horse breeding as he does about astronomy. It is true that nature performs wonderful things with animals under good treatment, but if the uterus is diseased to the extent that spermatozoa cannot live, how can the mare get in foal? In the April 5th issue we will try to show the best plan for preventing the spread of this disease.

During the last few years this paper has spent considerable time and money carrying on experiments on treating diseased mares. Wonderful results have been obtained during the last year. A line of simple treatment has been introduced that any horse breeder should be able to use without any injury. This treatment costs very little and it should be worth hundreds of dollars to any stallion or jack owner who expects to remain in the business. We have a very good method

of trying these different experiments, as the writer has a very large number of personal acquaintances who can make satisfactory tests and report the results in an authentic manner. This treatment will also be given in the April 5th issue, which is our annual barren mare issue.

We invite our readers to send in their questions and descriptions of special mares for that issue. It will contain charts and photographs with description of how to use them. If you do not receive the April 5th issue on time, write us for it as we want all our readers to be sure to have that particular issue. When you receive it keep it on file.

MASTURBATION.

"I would like to ask advice in regard to an eight year old stallion. He made a good season last year and in about a month he commenced masturbation, and he looks bad; hair is long; no life. I used a ring on him but he can have a discharge without an erection. The other day I was brushing him and had him cross-tied on the floor and he let a discharge out on the floor—I would think about three tablespoonfulls. It looked like healthy semen. What can I do for him? He is a valuable pacer."

Have a microscope ready so that the next time this stallion discharges this fluid, you can make an examination. See if there are any spermatozoa, either dead or alive. This may be a case of an undue amount of secretion from some of the glands along the urethra. If this is the case your animal is not in a serious condition, but it is not a good practice. This stallion should be a lesson for other breeders.

Masturbation among stallions is the result of bad practice. Usually Standard bred horses, or any other hot blood strain, that have a highly nervous temperament, and are kept in the best possible physical condition, should not be allowed to make a service or tease mares, or come in contact with mares in heat until a reasonable number of mares can be had with much regularity. When animals are in the best physical condition they are in the best breeding condition also, and if this animal nature is excited a great desire is stimulated to the extent that masturbation may be the result. Many horses of this kind are thoroughly broken and well mannered so that they may appear in any and all kinds of company without making any noise or showing any signs of this great desire, yet they have it, and when they are left alone at night in comfortable quarters, an opportunity is offered for the creation of this habit. Young stallions of any kind should not be used as teasers, neither should they be allowed to come in contact with surroundings where mares have been teased or bred. Their scent is excellent. If this desire can be kept dormant until such a time as it may be used regularly, the habit will not be started. A preventive in this direction is certainly much better than a cure. Owners of young, valuable stallions or jacks must pay more attention to this habit. It has ruined many good animals and will injure many more if the breeders do not pay more attention to it. More stallions and jacks are ruined from masturbation than from any other cause. It is a difficult thing to diagnose in many animals. Horses which are not associated with strangers, or many people, frequently do this about midnight; those which have been exhibited and are familiar with all sorts and scenes and conditions are liable to do it any time. There is only one way to be sure about this and that is to put a day and night watch on the animal, so that he will not know that he is being watched.

Masturbation does not always ruin the usefulness of an animal, but it very frequently detracts from his usefulness as a breeder. Plenty of exercise and the association of pregnant mares or geldings is not objectionable for stallions, but it is a very common thing to see a stallion standing in the stall in the same barn with mares in heat.

By way of correction a whang leather may be cut the right length to make a ring for the penis when it is not erected; the edges should be trimmed down; the ends stitched together so as not to cause any irritation; it should be brought forward and back so as not to leave it in one position too long. There may be other appliances that will prevent, but the best method is to be careful with the young stock so that they will not get this habit.

WHAT A SAMPLE COPY DID.

A stallion and jack owner was in our office yesterday. He came in to subscribe for the American Breeder. He said that he had received a sample copy two years ago; that he had kept it and studied it, and he called to mind seven extra mares that he had gotten in foal that year from information contained in that sample copy. The writer asked him why he had not subscribed sooner. He said that it had been carelessness on his part; that he intended to take the paper, but had just neglected it from time to time—keep putting it off. He said that he did not know that that sample copy was sent to him for the purpose of getting him to subscribe for it. He said he had never thought of it in that way.

We often wonder what stallion and jack owners think we send them sample copies for. We are especially anxious that every breeder in the country join our regular subscription list at this time so that they may start with us in the American Breeder school. We want them to study this first lesson and keep the papers on file so that they may be in on the ground floor.

QUESTIONS AND ANSWERS.

(Continued from page 5.)

our part to undertake to prescribe for an animal that has been lame for two years from the meager data furnished. By all means you should have this horse examined by a man competent to pass upon the location of his lameness before attempting treatment. An animal may be very lame from spavin and yet no enlargement appear at the usual site of that disease.

THE BEST IMPREGNATOR — Will you tell me what kind of an impregnator would be best to get, the O. C. Safety and Dilator or the O. C. Improved Reliable? I have to be away from home with my horse and would have to depend on others for the warm water most of the time.—North Dakota Subscriber.

REPLY:—We would not recommend any of these instruments. They have very little value in horse breeding. The best instrument, and the only one made that has any real value, is the Carlson Improved Semen Extractor; it can be used as an impregnator. The body of it is made of very heavy brass so that it will hold temperature longer and better than any other instrument made. If the semen is to be taken from one mare to the other, both mares must be close by. The instrument should be boiled before being used and have time to cool down to 100 degrees. It should be immersed in sterilized warm water and kept at exactly the right temperature; then it is inserted into the mare where the semen may be taken either from the vagina or the uterus. This is the only instrument made with which the semen can successfully be taken from the uterus. After the semen is sucked into the syringe the plunger is pushed in until the semen starts out at the point, with the point held up; then insert it into the other mare quickly before it has any opportunity to cool. You will get as good results from this breeding as you can get with any instrument. Be careful that the mare that the stallion serves is not diseased. Select the cleanest and healthiest mare for the service.

MANGE The summer of 1911 my colts got in with a bunch that had the mange and all took it. I treated them all with Texas crude oil that fall and it didn't show up until the spring of 1912. I treated them all again and now they are all getting it again. These colts are all in good condition. I also disinfected each time. This would take the hair off but still it don't seem to kill the germ. Please give me a cure that I can depend on for a cure.—North Dakota Subscriber.

REPLY:—One would think that the treatment given should clean up an outbreak of mange, particularly if it was repeated at the proper time. We would recommend that you make use of the well known lime and sulphur dip which is very effective. Take eight pounds of unslacked lime and boil it with sulphur in water so as to dissolve all the sulphur possible. Boil in as much water as you can conveniently for two hours and then add sufficient water to make 100 gallons. To do it properly the animals should be dipped in this solution for two or three minutes, the dip being used at the temperature of the body, viz.: 100 degrees F. If a dipping tank is not available, and the number of stock is not great, hand dressing may be resorted to, but it should be thoroughly done. The application, in order to be fully effective, should be repeated in ten days.

FOOT EVIL—Is foot evil in cattle a germ that lives in the mud and filth? or is it filth alone that causes it? What is the most effective means of getting rid of it after they become sore? Would any of the dip preparations be strong enough if placed in a vat and drive the cattle through it?—Indiana Subscriber.

REPLY:—We are not sure of just what you mean by the term "foot evil" as applied to cattle, but presume your stock has either been subjected to the irritating influence of mud or filth, or has contracted some infectious disease of the feet. A good practice is to provide a shallow broad trough at a point about the watering

Bringing in the cows after herding them all day around the commons in Spain so as not to waste any pasturage.

place where the cattle will have to pass into when coming to drink, and keep this filled with some of the coal tar disinfectants. This is a very effective way to control foot rot in sheep. Look carefully to remove the cause if due to irritating substances in their lots.

GLEET—Please tell me what to do to cure a horse of the gleet.—Kansas Subscriber.

By gleet we presume you refer to chronic nasal catarrh. This disease is characterized by a discharge from the nostril and may be dependent upon a diseased tooth for its cause. A careful examination of the teeth is in order to fully determine whether or not they are responsible for the difficulty. Again nasal catarrh frequently reaches a point in severity that it necessitates trephining the bones of the head so as to liberate the pus that may be pent up in the sinuses. If your case is one of rather long standing, it is quite likely that it has reached one of these conditions and it will necessitate surgical measures in order to effect a cure. If such a case it would be folly for us to undertake to tell you what to give in the way of medicine. It would be better to have your animal examined by some competent veterinarian so as to first be sure of the exact conditions present.

NAVEL ILL—I would like you to prepare a piece on bloody urine or kidney trouble in colts.—Missouri Subscriber.

REPLY:—Watch for a later lengthy article on "Navel Ill." Follow its directions and you will not have any colts with bloody urine.

SCOURS IN COLTS—Last year at foaling time I had trouble with my colts. At first they seemed to be bound up, then in a few days they would take the scours. I managed to save all of them but it was quite a task. Now what I want to know is how to remedy this trouble with the young colts. I take it that the scours are caused from the feed the mares get, or is it because the mothers have too much to eat? There was no veterinarian here but I saw a doctor and he prescribed as he would for a child—a teaspoonful of castor oil and one-half as much laudunum. My mares were fed on alfalfa hay straight and had all they wanted. I separated them at foaling time and they had a corral to run in with their young. We expect about seven colts this season out of eight mares. This is why I am after more knowledge on this subject. Two of my mares cost me $1,000 apiece and therefore I am anxious to save their colts. My stock is all healthy; running in the fields days and in corral or in a stable nights. We have had no abortions so far. Some of the mares worked hard for four weeks on a fresno pulling dirt out of a deep ditch; eighteen feet.—Utah Subscriber.

REPLY:—It would require a personal examination in order to reach a positive conclusion as to the real cause of the condition in your colts, but we fear on account of the number affected that there was some infection responsible for the trouble. First, we think you should attempt to make some other roughness, apart from alfalfa, a part of the ration near and through the foaling period. This plant excites a copious milk flow and perhaps early in the life of the foals their digestive organs were overtaxed resulting in indigestion and diarrhoea. It is never advisable to submit pregnant mares, particularly when advanced, to severe ditch work. The dangers of abortion or injury to the foal are too great. This season study carefully the diet of your mares and do not feed too heavily near the foaling period and for a short time thereafter. Gives the mares ample opportunity for exercise.

THREE YEAR OLD JACK SERVICES—How many mares can I breed with a 3-year-old jack this season?—Kansas Subscriber.

REPLY:—Three or four mares a week, no two services closer than ten hours, will give you the best results. Your jack may serve a great number of mares and get them with foal, but it may be a detriment to him in after years.

RETAINED TEMPORARY TEETH—I have a fine Percheron horse which will be four year old this spring. About a year ago he had an ulcerated tooth on each side above, the first one on each side. I had the veterinarian pull them out as they had caused his head to swell. One side went down all right but the other side swells up about once a month for a few days, then gradually goes down, but not to normal. It does not seem to cause any pain as he is doing well and always seems to feel good. I have been painting it with iodine for about two months, about a week, then rest a week. I can't tell that it has done much good. What would you suggest doing? The veterinarian thought perhaps he would have to lance it but I would like to treat it some other way if possible.—Oklahoma Subscriber.

REPLY:—The difficulty complained of was primarily due to a failure of the temporary molars to shed off at the proper time and by retaining their position in the jaw offer resistance to

Percheron Society Affairs

In March, 1911, this publication started a series of articles entitled "The Percheron Society House Cleaning," which resulted, at the December election in 1911, in a settlement of the points at issue satisfactory to most of the Percheron breeders at the time. Since that time we have done everything possible, with honor, to restore harmony and prosperity in the breed. If that agreement of December, 1911, had been faithfully carried out, as was arranged, the Percheron Society of America today would have been united without any question, but those in charge of the affairs have not done what they agreed to do. An effort was made to apply a "coat of whitewash," which does not suit the American people.

We have been condemned by some Percheron breeders, as well as others interested, for not continuing the agitation. We thought it best for every one concerned to let those in charge have an opportunity to get affairs and records in the best possible condition. We would have continued in this attitude if, in our opinion, an effort was being made to give the Percheron breeders a square deal. Now, as another cause for dissatisfaction, and coming at a critical time, appears, Volume 14 of the Record, that looks like an index, but it is supposed to be the complete volume. The pedigrees are not printed in full, only the sire and dam and the date of foaling, and the name of breeder are given. A notice printed in the book states that this was done by order of the board of directors, but this information does not enable a man to pick up this abbreviated volume and obtain the information which often is important to breeders and buyers of Percherons.

It is not likely that the Percheron Society of America will be run in a manner satisfactory to a majority of the breeders until some changes are made in the list of office holders, although some of the officers are highly satisfactory. At the next election in December the term of office of four of the directors will expire. These are H. G. McMillan, J. L. DeLancey, C. O. Keiser and W. S. Dunham. These men have held these offices practically ever since the association was started. They have had these offices a long time. If it is a duty to fill these positions these men should retire and ask others to perform a part of that duty. If it is a pleasure and affords them any advantage it should not be monopolized by these parties. If these four offices were filled with men satisfactory to a majority of the Percheron breeders, this dissatisfaction would soon cease. We cannot understand why these men do not resign. If these men are compelled to hold these offices in order to protect secrets in the records they will have a difficult time at the next election, in our opinion. There seems to be a general feeling among the Percheron breeders that there will be a "house cleaning" if necessary.

Most of our readers have heard of H. G. McMillan, who has owned some very prolific stock. J. L. DeLancey breeds few, if any, Percherons, any more. He handles the money for the Percheron Society of America and holds a salaried job. C. O. Keiser has disposed of most of his breeding stock and gives comparatively little time to the production of Percheron horses now. Mr. Dunham, of "Steam Roller" fame, is the fourth of those whose time expires next December, in all probability. Although there has been difficulty at many elections of the Percheron Society of America, practically the same officers have been re-elected year after year. A proxy committee is appointed to examine and vote proxies. These proxy committees have always voted for those who were up for re-election, as near as we know. This has made it generally impossible to effect changes in the officers unless some one should resign of his own accord or there should be some one on the board who was not satisfactory to the others; several such have been dropped. The December, 1911, election is practically the only exception to the general rule.

In order to safeguard a campaign for new officers from possible defeat by a report of the proxy committee it will be necessary for all of the breeders who are in favor of a change to unite on four candidates, so that all of the breeders will know who the candidates are in plenty of time. Then, in our opinion, there will not be any division. This will make the election easy for those who are in favor of a cleaner record. The American Breeder has devised a plan by which this can be done. Nearly every Percheron breeder is familiar with some honest, capable man or men that he would like to see on the board of directors. We want every member of the Percheron Society of America to write this office and name one, two, three or four such men as his choice for these candidates. We will start a voting contest and the four candidates receiving the highest number of votes can be the candidates for the next election. There are a few new members of the Percheron Society of America whose names and addresses we do not have. We want every Percheron breeder in the country to telephone other Percheron breeders what is going on, and ask them to join with us in this next election; explain to them the exact condition and have them send the names of their choice for candidates. Any communication coming into this office concerning this voting contest will be confidential. No one will be embarrassed. This should be attended to now; start it in plenty of time so that all of the breeders over the country will have a sufficient opportunity to know that something is going to happen.

No one should be offended at another Percheron breeder for naming his choice as a candidate. We contend that this is a free country and every individual has a perfect right to vote. Most breeders have friends with whom they are personally acquainted, and know them to be men of high moral character that can be depended upon. Why should they not make a choice of an individual of this kind? No others have as good a right to express an opinion in this way, for these Percheron breeders who own registered Percheron mares are the rightful owners of these records and they should be represented. After the four prospective directors are selected as candidates so that there will be no splitting of support, all can unite on these men. No proposed candidate will be offended if he fails to lead in the voting contest.

We will have more to say from time to time on this subject. We will also report fully each issue, the progress of the voting, until time to close. No one need wait on others to voice his preference. Here is one place every stockholder can get his vote counted. Let the votes come.

A LESSON IN DEVELOPING COLTS.

Percheron colts in the Percheron district of France. Notice the feed box which is always full of good feed. These colts never get hungry. They also have good pasture. There is a lesson in this picture for every draft horse breeder—plenty of feed and exercise.

SHIPPING STALLIONS AND JACKS.

Considerable money is invested in a good breeding animal, and much care should be exercised as to the method in which shipment is made. Nearly every state requires a health certificate. Before an animal is shipped a qualified veterinarian, one who is authorized to make this inspection, should inspect the animal and furnish a health certificate so that it will pass from one state into the other without any interference. There are many places where an exhorbitant fee will be demanded if this certificate is not ready to be shown at any time. Different states have different requirements, so that it is necessary to find out who is qualified to make this examination in order to be sure that you have the right papers at the right time. No stallion or jack should be started on a journey across any state line without a health certificate, as nearly every state requires this.

The usual shipping rate is based on 3,000 pounds for one animal. Different railroads have different rules, so that the larger the number of breeding stock, the less expensive it is, until carload lots are reached.

Before a valuable animal is loaded into a car it is profitable to disinfect that car; other animals that had an infectious disease may have been shipped in this car. This might result in a great loss. Most any good spray of a disinfectant nature will do for this purpose. An animal that has not been on a journey of this kind frequently gets very much excited during the early end of the journey. It is best to be present so as to be there in case of an emergency. Occasionally an animal gets very warm and makes it necessary to have a little ventilation. If an animal is to be shipped alone, and no one accompanies the shipment, a very good method is to turn the animal loose, whether it be a stallion, jack or mare; place in one corner of the car a barrel of water, substantially wired fast; fill the barrel with water and put a bucket in it so it will not splash out. A bale of hay is all the feed necessary for a short journey. It is better to withhold grain for at least 24 hours, or if any is given during this period it should be a very small amount. Stock are not liable to have any intestinal trouble if the bowels are empty, but plenty of water should be given at all times. Occasionally one end of the car is fenced off, so that the animal can have his freedom in that portion of the car, and then the doors are frequently left open. This is not altogether safe, because the train is liable to change directions, or the wind might change, so as to greatly change the temperature in that end of the car, which might result in the animal taking a bad cold or getting the pneumonia. These things must all be looked after with valuable animals. There is very little danger in shipping stock if the caretaker is alert.

Where a contract is made for shipment it usually specifies that the railroad will not be responsible for more than $100 per head. This has been found unconstitutional, but a late decision makes it binding in some cases. In case of an accident, do not remove the animal until the station agent has been notified of the accident; give him plenty of time to see and investigate the seriousness of the condition; do not notify any other individual except the station agent; he is the authorized agent of the railroad company. It is best to have a witness present when you notify the agent, if possible, then the railroad attorney can not go before a jury and say that they did not have an opportunity to inspect the damage at the time. Be very careful about signing any papers in a case of this kind. The railroads are very careful to make the price high enough so that they can afford to carry this stock, and it is our business to see that our readers are able to collect for the full amount of damage when such has been sustained.

TWINS—HORSE AND MULE.

A few cases of twins, one being a horse and the other a mule, have been reported. We will be glad to have our readers report these cases as they know of them. One reader is asking how this can be possible

Reproduction in the equine is maintained ordinarily by the female giving birth to a single one of her kind. It occasionally occurs that a mare will give birth to twins. Perfect twins result from two ova being fertilized at or near the same time. The periods between two fertilizations are not definitely known, but we have evidence that it may be any time between the two heat periods. This may result from one or more services of a single horse or from two horses or even from a horse and a jack. Services resulting in twins, one a horse and the other a mule, are rare occurrences.

Twins, as the result of the services of two different sires, are generally delivered in two separate envelopes or sacks. When delivered in one envelope it is due to the fertilized ovum having become divided, favoring the union of the two bodies in some manner and thus giving rise to a double monstrosity.

When fertilization takes place the cervix contracts and its opening is closed by a mucous plug, and thus it usually remains throughout the period of gestation. If, however, as sometimes occurs, an undue amount of secretion should occur within the uterus subsequent to conception, and force an opening from within through the cervix, thus permitting the fluid to escape, there would be an opportunity for another conception to occur should the mare be bred and there were additional ova released at about this period.

Experiences of Practical Men With Modern Breeding Methods

We have printed a large number of statements similar to these printed below, relative to the use of capsules, giving the names and addresses so that all those interested could go and find out for themselves. We also have received numerous complaints from breeders who had written us their experience along this line. They say they are receiving a great many letters asking for further information. These men are not under any obligation to answer these letters. If anyone is interested enough to know whether they are telling the truth or not, the proper way is to go and visit these breeders and see the mares and colts. We have space to print only a few more of the hundreds of these statements that have been received. In a former issue a request was made for breeders to give their experiences along this line. It is remarkable how the capsule system, as advocated by the American Breeder, is spreading. The failures have been very few. We have tried hard to make the instruction very plain. Those who have falied, and all our new readers, as well as our old readers, are requested to study the lessons in horse breeding which start in this issue. There is no need for any ordinary horse breeder to make a failure.

In regard to the capsule system, will say I have not had an occasion to use it to any great extent excepting on supposedly barren mares, and to my surprise the results were very satisfactory. I consider it a very good investment as one extra colt will more than pay for an outfit. Any stallion owner can operate with the best results if they follow the directions closely.—F. H. Jarvis, Bristol, Ind.

In regard to what results I have had with the capsule system of breeding, as taught by the American Breeder, I only bred a few mares two years ago and I got every one in foal, got 100 per cent. Last year I bred about 100 with capsules and as far as I can find out by this time there are at least 90 per cent in foal. It is hard to tell the exact number yet as I can't get to see all of my customers, but it is the only way to breed, as it gives the mare owner a chance to have his mares guarded against infectious diseases, as well as the horse and jack owner.—Barney Lott, Goltry, Okla.

I have been using the capsule system of breeding for the past three years, have had good success with it. Can get any mare in foal with a capsule that could be got in foal with a natural service and some that will not breed naturally, do breed by using capsules. I have got capsule colts all over this part of the country, and my patrons have ceased to look on it as an experiment and many of them ask to have their mares bred that way, and with small or nervous mares, or mares with any kind of malformation it is much better and safer than any other way. I advertise to make a service and use capsules at a certain hour and my patrons know that every mare that is here and in breeding condition will be bred, as I never make a failure and can breed any number in reason. I don't know of anyone around here that gets as big a per cent of colts as I do.—D. H. Adcock, Alexis, Ill

---

I have used the capsule in my breeding business with success. Last year got over 80 per cent of mares in foal, bred by this means. In fact, settled some that would not settle by natural service, though at first met with considerable opposition the people had been prejudiced by some inexperienced breeders using inferior impregnators. Now some of my patrons don't want anything else. In my opinion it is best, in many cases safer—the colts are just as good and it saves vitality of horse which makes a surer and stronger breeder.—John Scherer, Olney, Ill.

I have used the capsule system with the best of results and firmly believe the sooner every breeder gets accustomed to using it and have the capsule system used on their mares, a greater profit to them with less travel and not so much loss to mare owners.—F. Borgschulte, Portage Des Sioux, Mo.

As to my success with the capsule system of breeding, will say I have used almost every known device for the artificial impregnation of mares and I have found nothing that equals a Carlson Extractor and capsules. I have gotten mares with foal by this system that seemed impossible to do by natural service. As I breed exclusively my own mares, I consider I have saved several hundred dollars in the three years I have used them. In fact, I could not well do without them.—D. L. Harloborn, Enterprise, Oregon.

I have read your paper ever since it started and have learned more from it than I had learned before. I have been in the breeding business for 40 years. I have a set of the Carlson tools. I use the directions sent with them. I think it more sure and better every way than the natural service. Had a capsule colt take first premium at our fair. Am 75 years old, but will keep a good imported German Coach this spring. The breeding business is generally in the hands of those who know nothing about it. —Elias Harned, Jasper, Tenn.

I have been in the breeding business over twenty years but never did any capsule breeding until the last two years. I have had splendid success with the capsule system. A great number of my customers prefer the capsule breeding.—W. R. Husted, Centerville, Kas.

I have used the capsule system of breeding as advocated by the American Breeder the past season and find it a good success, where the work is properly done it is a great advantage over the old way of breeding. It gives the mare owner much better accommodations by giving them the chance to breed to a good horse for the price of a scrub.—John T. Adams, Charleston, Ark.

I have had very good success with capsule breeding and will do it more extensively in the future.—D. M. Gilchrist, Glasgow, Mo.

I used capsules for the first time telling my men to mark every mare when used, and I am not sure as any mare missed that capsule was used on; if there was, it was but one, and in one or two cases it was with mares that they had about given up ever getting a foal.—G. F. Hutchinson, Plattsburg, N. Y.

We had very good results with the capsule system last year and intend to stand our Percheron stallion at two places this season, on account of using the capsule system.—F. S. Jennison & Sons, Farnsworth, Kas.

I have used the capsule for three years to success and would not care to stay in the business without the capsule system. It keeps your stock sure. You can avoid undesirable mares. It is all O. K.—L. W. Hoyt, Barry, Ill.

A FINE SPECIMEN OF POITOU JACK, THE FAMOUS FRENCH BREED. And a Type that is Growing in Popularity in this County.

Have had fine success getting mares in foal that have always failed to stand the natural way. I have one mare that was torn in foaling her last colt so badly that she could not be bred the natural way and she stood to the first capsule. I think the capsules a great success.—S. J. Holmes, Wheaton, Mo.

I will say that I am well pleased with the Carlson semen extractor and microscope. I wouldn't take $100 for my extractor or microscope if I couldn't get another one. I will say I had pretty good luck with my extractor. I got as many mares in foal with it as I got in foal with the horse. I will say that every breeder should have a microscope to test the stallion every time he makes a service so that he will know whether he has live spermatozoa. I expect to do more of my breeding this year with the capsule.—A. M. Lorue, Sloan, Ia.

My experience with the capsule system as taught by the American Breeder, has been very gratifying in results, especially on aged mares.—Dr. C. W. Hobbs, Smith Center, Kas.

I say the extractor and the capsule business is the only way for success and would not do without it in my business at any cost.—J. W. Farnim, Pinckneyville, Ill.

I like your system fine, but they are not raising mares enough in this part yet to need it very often. No man that is in breeding business ought to be without it.—A. Calender, New Lyme, Ohio.

I have found by experience with the capsule system that it is very profitable. I do not know how many mares I have gotten in foal with these capsules, but know it is all right. I have some mares with foal that have been tried for years.—Joe Englerth, Morrison County, Minn.

I have used the capsule system some two years ago; I had good success, but the mare owners were afraid to use them until they would see if it was a success. But they see they are all right now. I did not keep a horse last year, but if I ever keep a horse again, the capsule system is the right way.—J. C. Lafferty, Danbury, Neb.

I have used the capsule on mares that could not get in foal with horse or jack, and 60 per cent has proved to be in foal and the capsule system saves the horse and jack.—W. B. Roe, Norcatur, Kas.

I have had good success with the capsule breeding outfit, and think every man that owns a stallion should have one.—H. J. Bailey, Glenwood, Mo.

A Percheron stallion photographed on the main street of Nogent, France, where the Percheron Stud Book is located.

I did not use the capsule until the last season, but had very good success; have a few mares that were bred when not in heat that are in foal. It is going to take better next year with customers, as they see how it works. I am well pleased with the per cent that I got; got some mares that never were in foal before. Am willing to do everything to help you I can in the future.—L. E. Goodale, Smith Center, Kas.

In regard to the capsule system, I think it is a great thing. I have got mares and jennets in foal that would not breed at all. Would not do without them.—J. S. Shank, Paris, Ill.

I find the capsule system to be all that is claimed for it, has been very successful in settling mares that had been given up as non-breeders. Also foaled my jennet with capsule, she was not in heat; has a nice jack colt by her side—that can be seen for inspection. I have convinced some who had no faith in it and will convince others if they will come to my barn where they will find as good jacks stallions as our satte affords.—W. A. Winningham, Honey Grove, Tex.

In regard to the capsule system, I had good success. I only used it one year, then I sold my breeding stock so I have no breeding stock now, but if I had I would not do without the capsule system, as that is the only way of successful breeding.—Geo. Sperline, Sabetha, Kas.

In regard to capsule system, I think I have had fine success with it. I have used it two years, had several capsule colts last year. Will show many more this spring. I bred seven mares with one service and never had to breed but one over. Two of them were mares that had been bred four times at another barn.—F. B. Griswold, Agra, Okla.

Stallion Service Record Book for Two Hundred Mares.—The latest and best on the market, as cheap as the cheapest. It is a handy pocket size with waterproof cover, printed on the best paper. It has a calendar, a gestation table and an index of twenty pages so that each mare can be found easily. Each mare has an entire page. This book can be used for several sires without carrying more than one at a time. Notice how easily it is to record the breeding of a mare and give the details. This record book is the result of the opinions of many breeders. It has no worthless advertisements in it. If you are not satisfied with it, return it and get your money, which will be cheerfully and promptly refunded to you. Price 50c each, postage prepaid. Published by

THE AMERICAN BREEDER

225 WEST 12TH STREET

KANSAS CITY :-: :-: :-: MISSOURI

I have had some trouble in getting the semen, but when I got it, I had good results. I think the capsule way of breeding is a success and is coming to the front. It is the best and surest way of breeding. I got some hard mares in foal by the capsule system that have been barren for years. —T. S. Adams, Udall, Kas.

In regard to the capsule system breeding, I will say I had very good success last year. About 75 per cent of what I bred that way are with foal this spring.—T. W. Williams, Charlotte, Ia.

I could not say too much for the capsule system. I settled two mares over 20 years old with capsules last season that had not had colts for years and bred regularly every year, too. One of them had a bad case of leucorrhea, the other never had but one colt. I want to boost the capsule system.—S. S. Mouse, LaCygne, Kas.

The capsule system is the only way to make horse breeding pay in this day and age of the business. If I had to go back to the old way I would sell my horses and quit the business at once. I have very good results from the capsule system, but always breed the healthy mares by natural service. Capsuled one mare 21 years old that had one colt 12 years ago, and she had a mule colt, and a good one, too. Capsuled one mare with a slit in the neck of the womb four inches long, and she foaled a capsule colt.—M. Roberts, Tecumseh, Neb.

In regard to the capsule system, as taught by the American Breeder, will say that I have practiced it for two seasons. Have got larger percentage of colts, put in less time and trouble, and used less stock. Expect to continue using the capsule system.—L M. Laflin, Milo, Mo.

When I started using capsule system three years ago, my competitors knocked on it, telling mare owners (some of whom didn't know any better) that it took all the service to make a colt and that the strongest germ destroyed the weaker ones. However, I have been sawing wood all the time and find my list of customers gradually increasing. It is no uncommon thing to hear men, living out of my territory, state that I was one who started their mares producing. At my colt show last fall, the capsule colts were among the prize winners. I am striving to improve on my methods and would not, for any amount of money, go back to the old way. I use the microscope and find it is a strong argument in convincing mare owners that live spermatazoa is what they want instead of simply having their mares ridden by stallions. As for me, I will stick to the capsule system. Wishing you success in your educational campaign, I beg to remain, yours respectfully.—W. F. Burnett, Vergennes, Ill.

A Belgian mare and colt on the road to a summer horse show in Belgium.

I am only a young man, but I find the capsule system a very easy and successful way of breeding if the operator is accurate and clean. Our horse is young, but with the capsule system, I could handle all that came and not injure our horse. A large per cent of the first capsule mares were mares that had failed for several years and the owners thought they would try a stallion that was not worn out. The largest per cent of these mares settled with the first service. I would not do without the system and think it is a great help to modern breeders.—John G. Pribblenow.

BARREN MARE ISSUE.

Several readers have written us asking if there would be another barren mare issue this spring, and if it would contain simple remedies for barren mares. April 5th issue is our annual barren mare edition. It will contain the saline solution, soda, iodine and other treatments for the different conditions. We want our readers to pay particular attention to this issue, and if they do not receive it on time to be sure and write for it, as it will be valuable. Do not forget April 5th issue.

THE MARE SHOULD BE "RIGHT."

To the American Breeder:—I'm of the same opinion as W. H. Reid of Ohio, that is in regard to the shy breeder or doubtful mare. It certainly ought to be to the mare owner's interest to get his mare in foal, and if the stallion owner is willing to deduct the veterinary prices from the service fee, this, I think, would be a bonanza for the mare owner. The most serious question I see is whether all veterinarians would be able to pass upon cases of this kind. There is no question about there being a great many mares in diseased condition, apparently looking all right. I have had some experience with such mares since I began to breed with capsules. There are thousands of these mares bred every year, scattering the disease throughout the country. If they were bred by the capsule method, the operator understanding his business, the chances for spreading the disease would be greatly eliminated. I trust there will be a law passed soon compelling all mares offered for service to have health certificates from a competent veterinarian.—M. G. Viers, Webster County, Iowa.

STALLION and JACK CUTS

We can furnish cuts for bills, letter heads and all kinds of stallion and jack advertising.

A New Line, True to Life, The Best Work, Prices Low.

Send for sample sheet and subscribers' prices.

N. B.—We do not do any printing. We simply furnish the cuts.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED,
225 WEST TWELFTH STREET, Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Chicago Representative,
JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates.

1 inch: 1 month, $5.00; 1 time, $2.80.
½ inch: 1 month, $2.80; 1 time, $2.00.
Rates for longer time or larger space furnished on application.

Subscription price, per year, $1; three years, $2; clubs of four, per year, $3.00.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

Copyright, 1913, by the Graham Publishing Co.

All persons are warned not to reprint any part of this paper without first securing written permission from the American Breeder, Kansas City, Mo.

HANDLING STOCK WITH KINDNESS.

There are four things that are very cheap and are not used enough in handling live stock, kindness, sunshine, fresh air and pure water. These are all necessary, but perhaps the one used less and worth more in maintaining live stock is kindness. Animals that are not abused or afraid of their master will live on less feed, thrive better and are usually more easily handled. On many farms horses, especially, are abused and roughly handled when it is not necessary. There are many hired hands handling live stock that cost their employer more money by their coarse method of handling live stock than their salaries amount to.

When one visits a farm and all of the live stock is gentle, so that they can be easily approached, and glad to see their master, it is evidence that they are getting full value for their feed. But where animals are excited and jump every time they are spoken to, or something moves, the digestive organs are not working as nature intended. A horse is of a highly nervous temperament, perhaps more so than any other animal. Horses must be handled firmly but at the same time kindness is a necessity.

A little different treatment is called for in an entire animal. One must always remember that in handling one of these individuals that their masculine character is liable to exert itself at any moment, and a little more firmness must be displayed by the caretaker. In handling stallions or jacks the best method for the caretaker to teach them that he is the master, is with a bridle that will control them. There is very little use for the whip. If it ever becomes necessary that one of these animals must be whipped, a good severe whipping should be administered, and then a very long vacation should be given before another whipping should be thought necessary. This continuous slapping and pounding gets very little results. In fact, the animal rather gets so he expects it. Those who expect to get full value of all the feed given to live stock must administer a part of that necessity in the way of kindness.

KEEPING FAITH WITH OUR SUBSCRIBERS.

We have been asked to issue big, special editions, and make them highly colored and artistic. We never have been favorable to these handsome bindings that require a lot of money to prepare. It has always been our aim to make each issue a little better in actual utility value than the last one and to condense the information so as to make the educational value a little more available to all. We realize that our readers are business men; they are not looking to us for entertainment; they want something of a solid nature that is not rehashed each day by the common run of publications. We have given our readers opportunity to help make special subscribers' issues in order to bring out new points and break the monotony of reading what the other fellow says all the time.

There is this about our policy which we think more worthy of pride: We have not allowed our advertising patronage to influence the policy of the paper. We have been particular about the character of the advertisements which appear in this paper (more especially about that class which appeals to the bulk of our readers) and have never allowed the presence of any advertisement, large or small, to influence our editorial treatment of any subject. Our advertising space is for sale to all men or firms of good repute, who use it for legitimate propositions to our readers, but the use of our editorial space is given entirely to the interests of our subscribers.

One single subscriber has made a complaint about the advance in the subscription price. He states that he can get another publication for $1.00 a year that is larger than the American Breeder. But he did not realize that that particular publication is carrying and lending its prestige to a lot of advertising that we would not accept. We have letters in our office to show that we have turned down business which the publication he mentioned has given pronounced attention.

We believe that in the course of time the breeders of live stock will begin to realize that a publication to be of value to them must be edited in their behalf and not "tucker" to the crooked element. There are not many men but what have had transactions at some time or another which they regret, but as time advances they all find great opportunity for improvement.

The editor of this paper has been greatly benefited by occupying his position. He has learned that many individuals have followed his advice, and here is an important thought for every individual who has influence in public life, "Where shall he lead them? Will he teach them to be crooks or to become upright, honorable citizens? Will he accept a lot of 'fake' advertising and allow that policy to warp his conscience?" Responsibility is one of the greatest factors in building moral character. We recently heard an individual say that he was able to take care of himself in any and all company, and was willing for the rest of the individuals to do likewise. But this life is not all a matter of dollars and cents.

We are asking all the time of our readers for any information they care to give in making the American Breeder a better paper; one that will have more influence for the improvement of live stock, as well as raising the moral standing of men. We believe it is the duty of everyone interested in better farm stock, better farm homes and better citizenship to study these questions carefully. The most we can do with printer's ink is to cause people to think and think aright.

INTEREST IN ADVERTISING.

Most everyone is interested in this particular line of business. Breeders of live stock are anxious to know what other breeders are doing. They like to understand more about the live stock trade. Some may have never noticed it, but one of the first things an average breeder does when he receives a live stock paper is to look at some special department. This may either be the advertising department, or he may be looking for some more information in his special line. At certain times of year many breeders are more interested in the advertisements than the reading material.

Those who have contemplated purchasing breeding stock know what a great study it is. One breeder recently said that there seemed to be so many animals for sale that he did not know where to go first; but after this breeder had looked around a while, he discovered there were not so many that met his requirements for sale, after all. There are a lot of people buying breeding stock and the growing demand is for the better stock.

One of the reasons that a breeder should read and study the different departments is, that from this study he learns how to advertise. Advertising is just as important to those who wish to dispose of many animals as it is the producing of them. Those who expect to have animals to sell in the future cannot begin too early to learn a system of advertising. Salesmanship is just as necessary in the breeding business as in the mercantile trade. A shrewd merchant will not carry anything over through a dull season if there is any way to avoid it. When breeding stock reaches maturity it is not only expensive to keep it, but it actually begins to decrease in value if not properly used. Females may be bred and produce young, but sires must be used on other stock to be profitable.

In the case of a valuable sire, a good volume of trade must be secured. The more thought this subject is given the more breeders will see the necessity of learning how to advertise. One of the very best methods is to read the advertisement of the successful man in the business. It is a good plan to look at the advertisement from the other fellow's angle of the game. Look through the advertisement and see which one you would select first and see what particular sentence or line of argument attracts your attention. There is no better time to begin a study of this kind than with this issue of the American Breeder.

GETTING THE BUSINESS.

The first thing necessary in building a substantial business is to be able to give value received. No one can expect his customers to continue year in and year out unless they get a good value for their money. When a breeder is introducing new sires that have not shown their real value in that vicinity, those to whom he has proven himself to be a gentleman, will believe his statements. There is no other one thing as essential in the business world today as that of a good character.

Practically all business is done on confidence. When the government puts its seal on paper money we believe the United States Treasury Department will do just as it has agreed to do. When we buy young stock or patronize an individual in any way, we have confidence in his integrity. If we do not, we would not give any more for fine stock than it could be cashed for on the open market. There never was a time when honor and character commanded a greater premium than at the present time, and this is especially true in high class live stock business. Quite frequently we see an individual take chances on making a little money with a shady deal that ruins his chance of building a foundation for a wider business in the future. No one in business can afford for any price, to destroy the confidence of men in him. One of the greatest lessons that can be taught to the rising generation is to be strictly honest.

There is no other place where this has more value than with the owners of good stallions and jacks. These men do business with the same class of people for years, and the best advertisement that any man can have is for his neighbors to say, "Go and see this man; you will find him a gentleman." This life is not all a money consideration. Those who have feeling for their fellow men, and who keep their character clean by living a life beyond reproach, have something to live for.

RENEW.

Renew your subscription now. Those who expect to read the American Breeder must keep their subscriptions paid in advance. This paper stops when the subscription expires. It may, in a few cases, be sent for a few issues, as the subscriber may have neglected to renew, but all subscribers have been notified and those who are not paid in advance at this date will not receive any more papers until the subscription is renewed. The American Breeder is printed twice a month and contains real information for its readers. Every article in it is closely copyrighted. It does not belong in that class of publications that rehashes material from other cheap publications that are maintained by advertising. There are two classes of publications. One is conducted for the benefit of the readers; the other is sometimes called a mail order sheet. It is our duty to protect our readers and give them the best service we can, regardless of cost.

The breeding season is just now beginning. We do not see how any breeder can be without this publication for $1.00 a year. It can be had cheaper by subscribing for three years, for which the price is $2.00.

FORMING BREEDERS' ASSOCIATIONS.

Every stallion or jack owner, who expects to remain in the business, is offered a wonderful opportunity to organize a Breeders' Association among his mare owners. The school conducted by American Breeder can just as well be given to the owners of mares as of sires. We will make a special subscription offer for this purpose, in clubs of four or more for seventy-five cents each per year. A little effort on the part of the owner of a stallion or jack can get a large number of these men, and especially the young men, interested in it. The time to begin is right now. All subscriptions sent in before the 20th of this month can get this issue of the American Breeder containing the first lesson. No breeder can expect to have a good breeding community unless he educates his customers. This education will form a union stronger than any other advertising can do. It will be a business getter. The owners of mares will appreciate his efforts, because it will be valuable to them.

"STALLION AND JACK NEWS."

We frequently get requests for sample copies of the "Stallion and Jack News." The name of the Stallion and Jack News was changed to the American Breeder, at the request of its readers, in December, 1911. There is no newspaper now known as the Stallion and Jack News, or any paper of a similar name that is recognized. There is a circular sent out occasionally bearing a similar name, which is an advertisement for some kind of "dope," that in some cases has very

CLASS No. 23 (FEB. 17-22, 1913), OF THE GRAHAM SCIENTIFIC BREEDING SCHOOL, KANSAS CITY, MO.

Vought, Hampton, Ia.; 119, W. A. Mathes, Meadville, Mo.; 120, R. A. Kibby, Clint. Tex.

little value and in most cases has a great profit for the individual who sells the stuff. The reliability of that circular may be left with those who have purchased the "dope."

The name "Stallion and Jack News," however, will long be remembered by many breeders. In fact, some of our subscribers in writing to the American Breeder still call it the Stallion and Jack News.

GOOD BREEDERS NEEDED.

It is remarkable how many owners of breeding stock are making inquiries from those successful with modern breeding methods. This opens a new field of occupation. There are thousands of breeders who do not wish to go to the trouble to learn the breeding business, but who wish to employ good men whom they can depend on. The owners of this stock have realized that there is something wrong with the financial end of their business. The old method of employing for common wages someone to stand the stallion and jack who does not know anything about it, should be a thing of the past. An educated man can very easily double the income from a good sire without increasing the investment. This fact should cetrainly stimulate thousands of breeders to act if they would think about it. Any breeder can turn to his record book and find where a good number of mares have been bred through the entire season without getting any results. These mares are certainly not very profitable. The next thing is to know what to do with them. We want everyone interested in this subject to join thee American Breeders' School, which starts in this issue. It matters not whether he owns horse breeding stock or not, this information will be valuable for breeders of any kind of live stock.

EXCHANGING SIRES.

A stallion, after about four years' time, usually has in its neighborhood many fillies to be bred. It is common practice in this country to refuse to inbreed live stock. A breeder may have a filly out of this stallion, as well as other mares. He does not wish to breed this filly back to his sire, so he begins a search for another stallion. When he has found a suitable sire for this filly, it is usually the case that he arranges to breed all his mares at the same place. So it is not the filly so much as the inclination for this breeder to take all his mares to the same place, which creates a necessity for another horse. Some of these stallions that have been in service long enough to have mature progeny, have proven themselves to be excellent sires, yet a change is found necessary in most cases. The owner of this stallion sees the need of getting new blood, but he does not know where nor how to make the change. He is afraid to advertise this stallion for sale, because he does not want his customers to know that he would sell the horse for any price.

In reality, these stallions that have proven themselves to be excellent sires should remain in that vicinity, but the question is: can the owner of that stallion afford to do it? There is one thing that we are sure of; that the owners of these stallions cannot sacrifice them. A stallion that has been in service just long enough to have a lot of fillies to be bred is just in his prime, but this is not saying that this is the only good stallion in the country, because there are others just as good, and the owner of this stallion could not do anything better than to find some other breeder in exactly the same condition with a good stallion needing a new horse. This is where the best possible business can be done in the breeding business. The owners of both stallions will have an opportunity to see the colts at maturity; the only time when the real value of a sire can be accurately estimated.

A breeder of good standing at home can go back to his people and say: "I have seen the colts at maturity from this horse; I know he is a good breeder; he has given good results; I believe he is just in his prime; and if you use this stallion, you will not make any mistake." This kind of talk coming from a good straight man, will get him business. A stallion for which he can say as much might be found in an adjoining county, or at least, not a great distance away.

The next thing is how to find this other horse, and when is the proper time to do it. During the breeding season is the proper time to begin negotiations of this kind. An advertisement can be inserted in this paper, giving a description of the stallion: breed; age; home bred or imported; color; form; condition of flesh; how long stood in one place. This if the breeder does not want anyone to know who owns this particular stallion, the advertisement can give the number of his postoffice box, town and state. This advertisement should be started soon, so that breeders could correspond with those who wish to make a change. This would give them an opportunity to see the stallion during the breeding season. Arrangements could be made so that the change may take place at the close of the season. The stallions would change in their ordinary breeding condition so there would be practically no danger of sickness and they would both remain in good breeding condition. They could find their new homes early, which would give their owners an opportunity to try them and be ready for the next season, with very little expense.

We consider this particular subject one of the most important in the stallion business. It is not an uncommon thing to see a valuable, tried sire, sacrificed for almost nothing. With the great demand for these good horses, it would seem to us that everyone owning a stallion of this kind would be interested in this subject. We know there are thousands of fine, pure bred horses that must be changed this year. An advertisement of this kind in any issue of the American Breeder will only cost $2.80 for one inch, and it will put the owner of this stallion in touch with those who wish to exchange. There will be a lot of breeders who will wait for the other fellow to advertise, but we wish to say that those who advertise first will have a choice of the horses to work on. We should think that this choice would be worth at least $2.80.

We want everyone interested in an exchange of this kind to watch the advertising department of the American Breeder through the breeding season, for these changes. Hundreds of changes like this have been made through this paper and it offers much to the breeders. We doubt if it has been appreciated.

The field is the best classroom for instruction in practical agriculture.—United States Department of Agriculture Report.

February Markets Closed High

Demand for Horses and Mules Still Broadening. Beeves Make Record Gains for the Season. Stockers Highest Ever. Hog Receipts Past Two Months 17 Per Cent Below a Year Ago.

"Horse hide will soon be as scarce as sea otter fur," was the word the motor truck men assembled in Kansas City last week passed out to the public. All business has to pass through the speiling stage, and the motor truck men are no exception in their business. They have had it in for "Dobbin" for the past five years, and the only thing they can get against the horse is that one of these big trucks has to be pulled out of a mud hole once in a while by a big strong span of horses. Look at a few facts and draw your own conclusions. About five years ago the motor trucks became a possibility. In a much more perfected state now than then prices have been reduced 25 to 40 per cent. It has been proven that the truck is profitable for hauling large tonnage for a distance of more than one mile, and only on unusually good country roads, or paved streets at that. It is still too expensive in short hauls, and where much backing and dodging is required. It cannot do the hauling required in construction, grading, levee, lumber, farm, and numerous other lines of building and pioneering.

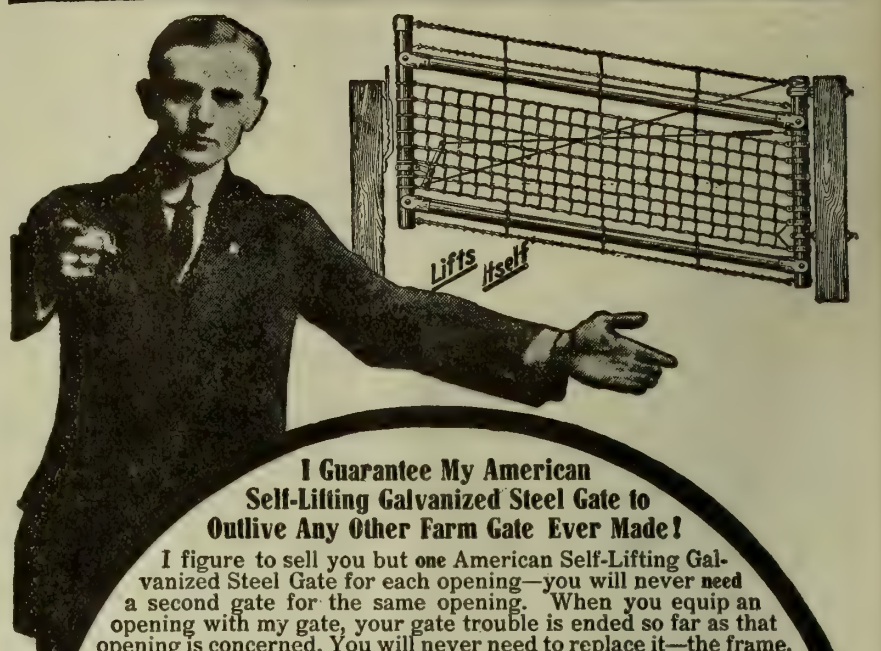
On the other hand, prices now for horses and mules are 100 per cent higher than five years ago, and the highest in the history of the country. One county in Missouri fattened and sold over one-half million dollars' worth of mules in the past eight weeks. At any market center in the central west, and there are about eleven of them, a day's business seldom falls below $50,000, the record for a whole week of motor truck sales at last week's big exhibition of motor trucks. Demand for draft stock extends almost from the Arctic circle to the equator, and from coast to coast.

At the Kansas City horse market last week prices were strong and the trade active. Other markets reported a healthy demand, and all classes sold freely. Except for mules, the most urgent demand is for farm mares. The country man wants both pulling and producing power, and it is hard to get enough heavy mares to go around. The East is buying heavy drafters, and the best class of heavy mules available. The lighter classes are going South and Southeast. Farm requirements are large. Some levee, sugar, lumber, and mine orders were filled. Also mules were sent to the big farming sections. Dealers say that receipts are not coming up to expectations and that the supply is hardly equal to the demand. Prices are so high that much economy is being practiced. Any tendency to weaken the market brings out renewed demand. Farm animals will be in active demand for some time to come, and with a big amount of construction work going on in the country, no one anticipates any curtailment in prices.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$230@275
Drafters, fair to good	150@230
Chunks, fair to choice	130@165
Chunks, fair to good	90@120
Expressers and light draft	50@110
Plain workers	40@ 85
Southerns, good	125@145
Southerns, plain to fair	65@125
Plugs.	20@ 55
Mules—	
13 to 14 hands	$ 85@135
14 to 15½ hands	125@165
15½ to 16 hands	160@200
16 to 16½ hands	190@285

February Cattle Prices High.



The last two weeks in February added 25 to 50 cents to practically all prices of cattle. Fat steers sold up to $9, or at the opening figures this year, and the plainer steers were higher, showing the biggest February advance on record. The average February is a month of sagging prices, as supplies of beef are large and generally packers look forward to decreasing rather than increasing stocks of meat. This year, however, they anticipated more beef in February than in January, but the contrary proved true, and late February prices were the highest. The bulk of the best steers coming now are selling at $8.25 to $8.75, a few selling up to $9 and $9.25 would be paid for strictly prime beeves. Fair to good steers are drawing $7.65 to $8.20, and quality considered, they are relatively the highest. Steers from below the quarantine line sold up to $7.95, the highest price ever paid for that class of cattle in February, and 20 cents above the January record. The entire market shows a very narrow spread in prices, and there are strong indications that the prime offerings are in for a general advance. Following the close of the Lenten season there is usually an urgent demand for prime beef. Easter, March 23, will close that season, and killers in the next few days will be after choice steers. On the other hand, the cattle being fed now are in strong hands. Feeders have been encouraged to hold on by the February rise in prices, and the scarcity of thin cattle for future feeding makes pounds gained an important factor. The past ten days was the most unfavorable period of the winter for feeding, cold, rain, sleet and snow were hard on the cattle, but at the same time it supplied stock water in many localities that were almost dried up. It also insured a good start to grass, with the first touch of warm weather. Light weight cattle will have a broad outlet in March and April, and weight making may be discounted some then as a change to rising temperatures usually calls out demand for light cuts of beef. Nebraska is shipping its cattle freely, Colorado still has some hay fed and beet pulp steers, Texas and Oklahoma will contribute a good many cotton-seed meal and cake steers. Reports from Southern Texas are that the early weeds have started to grow and that cattle have found enough pasture thus far to begin gaining weight. This means some early grassers, with the assistance of cotton seed cake.

Quotations from the various grades of killing steers are as follows:

Prime corn fat steers	$8.75@9.25
Good to choice steers	8.25@8.70
Fair to good steers	7.75@8.20
Common to fair steers	6.50@7.70
Meal fed, choice	7.65@8.00
Meal fed, common to fair	6.65@7.60

Cow and Heifer Trade Active.

Scarcity continues the prominent feature in the cow market. Killers seldom find enough cow and heifer stuff to fill their orders, and added to this the inroads country buyers

I Guarantee My American Self-Lifting Galvanized Steel Gate to Outlive Any Other Farm Gate Ever Made!

I figure to sell you but one American Self-Lifting Galvanized Steel Gate for each opening—you will never need a second gate for the same opening. When you equip an opening with my gate, your gate trouble is ended so far as that opening is concerned. You will never need to replace it—the frame, couplings, hinges and spring will never need repair. This I guarantee.

The American Self-Lifting Galvanized Steel Gate

has, and is, ending gate trouble for the leading railroads, farmers, ranchmen everywhere—and is used and indorsed by the U. S. Government. It is Hog-tight and Bull-strong. It has won First Prize at every State Fair wherever exhibited. It is the guaranteed Perfect Farm Gate - not Automatic, but Self-Lifting. It is made of two-inch high-carbon drawn steel tubing—heavier and stronger than any other gate made and all couplings are made of the same steel.

Other gates use cast couplings. They break and you know it. It is galvanized. It is five feet high (most other gates are four and one-half feet high). It is adjustable and will swing over uneven ground or snow. It sits plumb on sagging or knotty posts. It has both Ratchet and Loop lock and is therefore hog-tight and bull-strong. It will not sag or drag. It is made to full size of fence opening. Its hinges are suitable for all standard wood posts (for concrete or stone posts proper hinges are supplied). It can be opened with ease by woman or child. It is securely and strongly made. It is the one perfect farm gate. USE THE GATE THREE YEARS and if you do not find it to be exactly as your dealer and my Company represent it, return the gate and get your money back. Write me today personally for dealer's name and my free illustrated descriptive gate booklet.

"Can't-Sag" Gates Cost Less Last 5 Times as Long

I'll save you big money on your farm gates. My new catalog quotes such astonishingly low prices on CAN'T-SAG GATES AND GATE STEELS that you simply can't afford to build another clumsy, all wood gate. My FREIGHT PAID PRICES are half what others charge for short-lived steel, wire and gas pipe gates.

30 Days' Free Trial—5 Year Guarantee

I give 30 days free trial and a signed 5-year guarantee. Send for my big free Gate Catalog at once—see why Can't-Sag Gates outsell and outlast all others. Read what other farmers and stockmen say about them. When you get this book you can either select complete CAN'T-SAG GATES, Ready to hang, any height, any length—painted or unpainted or if you prefer you can order just the GATE STEELS (which includes everything but the boards). With these you can build your own Gates in 30 minutes and SAVE BIG MONEY.

Amazing Prices on STEEL Shingles

The demand for Edwards "Reo" Steel Shingles has become so big that we now sell them from factory to user for less—actually LESS—than common wood shingles. And we pay all freight! LOOK INTO THIS MONEY-SAVING PROPOSITION BEFORE ROOFING YOUR BUILDINGS. SEND POSTAL TODAY AND GET FACTORY PRICES.

No Trick to Put Them On

You don't have to nail these steel shingles, like wood shingles, ONE AT A TIME. Put on as high as 100 at once, for they come in big sheets ready to nail on sheathing or old roof. It's ten times easier than putting on wood shingles. No extra materials to buy, no painting to do, no tools to borrow. Your hired man can do the job with a hammer.

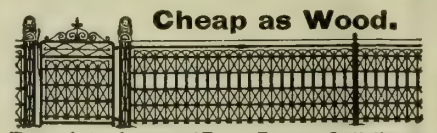
Absolutely Rustproof

Please don't judge Edwards Steel Shingles by common galvanized iron roofing—the kind that rusts. We have invented a method that absolutely prevents rust from ever getting a foothold, as 100,000 delighted owners of Edwards Roofs have found out. It's the famous Edwards Tightcote Process applied to genuine Open Hearth Steel.

Protect Your Buildings from FIRE

Don't take chances of fire from defective chimneys, flying sparks and lightning. Roof your buildings with these Steel Shingles and make them safe. Remember, nine out of every ten fires start with the roof. We specifically guarantee every Edwards Steel Shingle Roof against lightning. This Guaranty is backed by a $40,000 Cash Bond.

Cheaper Than Prepared-Paper Roofing



Edwards Steel Shingles cost less, far LESS, than prepared paper or composition roofing. IF YOU FIGURE THE COST PER YEAR. And that's the right way to figure.

Write for Special Proposition

Send postal at once for latest Roofing Book 3364 and Special Factory Prices. Give size of roof, if you can.

have made in the supply there is a general shortage. Heavy cows, Thursday, sold up to $8, or as high as heifers, though buyers say prime tidy weight heifers would bring $8.25 or better. Cold weather cut down receipts of veal calves, and prices are

A jaunting cart used in the large cities of Ireland; the principal means of conveyance about ports and depots. This vehicle carries six passengers besides the driver.

up 25 cents. Bulls are selling up to $7.

The following quotations are for the various grades of butcher stuff:

Cows—	
Choice. .	$7.00@7.75
Fair to good	5.75@6.95
Common to fair	4.75@5.70
Canners. .	4.25@4.70
Heifers—	
Choice fed	$4.25@4.70
Good to choice	7.25@7.75
Plain to fair	6.25@7.25
Common. .	5.00@6.20
Veal calves	5.75¾10.00
Bulls. .	4.50@6.75

Unprecedented Stocker Prices.

Stock and feeding cattle in the past two weeks have sold at the highest prices ever known, and it looks as though there was no let up in the demand. The top prices were $8.35 for feeders, $8.25 for stockers, $7 for stock heifers, and $6.50 for stock cows. The bulk of the stock and feeding steers brought $7.25 to $7.75. Demand is coming from a wide area, and general scarcity has entered into the price, making the plainer kinds relatively the highest. Some cattlemen say that March prices will be still higher.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.75@ 8.35
Good to choice feeders	7.50@ 7.75
Plain to fair feeders	7.00@ 7.45
Selected stockers	7.50@ 8.25
Good to choice stockers	7.25@ 7.50
Plain to fair stockers	7.25@ 7.50
Stock calves	6.75@ 7.20
Stock cows	4.75@ 6.25
Stock heifers	5.00@ 6.75
Milch cows	35.00@90.00

Higher Prices for Hogs.

In the past two weeks hog prices reached new high levels for the year. On Tuesday, a week ago, $8.50 was paid in Kansas City and $8.72½ in Chicago. In the next two days prices fell back 25 to 30 cents, but most of that loss was regained and the market closed the week in a firm position. Decreasing supplies at Western markets, together with an increased demand from the East were the principal causes of the advance. Provisions came in for a rise also, and that part of the market, though showing unusual dullness up to this time, is now in for further advances. Packers have apparently lost control of the market. The demand is not dependent on packers, as the small slaughter houses throughout the country are buying, and many of the Eastern markets are drawing their supplies from the West. Chicago territory is shorter of hogs than Missouri river markets. Heavy hogs are coming freely, considering the total supply in the country, and the light weight grades command a premium over the heavier classes. Prices at shipping points now are $7.75 to $8, and any drop from that level will reduce the movement.

The following quotations are for hogs:

Choice, 250@300 lbs	$8.15@8.35
Choice, 200@245 lbs	8.25@8.40
Medium weight	8.20@8.35
Light weight	7.75@8.40
Common to fair	7.50@8.15
Stags. .	6.50@8.10
Boars. .	4.75@7.75
Bulk of sales	8.20@8.35

The following table shows the range in hog prices in the past two weeks:

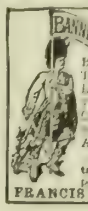
		Preceding Week.
Mon., Feb. 10	$8.10@8.40	$7.85@8.15
Tuesday	8.20@8.50	7.95@8.30
Wednesday	8.00@8.35	8.00@8.25
Thursday	8.05@8.32½	7.85@8.15
Friday.	8.10@8.40	8.00@8.25

Lambs Lower; Sheep Higher.

The bulk of the offerings at the sheep pens in the past two weeks were lambs and prices fell 25 to 40 cents, closing February lower than at the opening of the month. Sheep were comparatively scarce, and practically all grades were quoted up 25 cents. The spread in prices between sheep and lambs now is narrower than at any previous time this year, with sheep relatively higher than lambs. Weather conditions have delayed sheep shearing near the big markets, and a good many sheep in fleece are awaiting warmer weather. Omaha continues to receive liberal supplies of sheep. Improved prices are expected for lambs in the next two weeks. Choice fat lambs are quoted at $8 to $8.40, fair to good $7.50 to $8, yearlings $7 to $7.75, wethers $5.50 to $6.50, ewes $5.25 to $6.15.

February Live Stock Receipts.

In February receipts of cattle at the five Western markets were only 62,000 short of the same month, 1912. Kansas City received about 22,000 more and St. Louis 12,000 more, though the other markets reported a decrease. In the two months this year the five western markets received 1,169,000 cattle, compared with 1,235,000 in same two months 1912. Hogs decreased more than 300,000 last month, making a total loss for the two months of 684,000, or 17 per cent. Sheep were 113,000 short in February, and 216,000 short for the two months. Both traders and commission men say there is little prospect for any increase in supplies in the next three months. Increased weight in cattle and hogs has offset the shortage to some extent.



Stannard's Processed Crude Oil

MARCH 1913 CATALOGUE 68 pages

FRANCIS BANNERMAN, 501 Broadway, New York City

GENTLENESS IN HORSES.

In the horse market certain animals must fill certain requirements. One of these requirements is a good disposition. A horse must be gentle, as a rule, to bring the most money. This is one of the reasons that branded horses do not sell so well in the Eastern markets. The purchasers who are not familiar with Western horses expect to find a bronco disposition closely associated with the brands. An animal which has not been properly broken and accustomed to the different sights in a new locality is not as valuable as one that can be depended upon.

Quite frequently in the large cities a team will be hitched to a load of property valued at hundreds of dollars. A team which can take these loads through a crowded street, sometimes only moving the wagon a few feet at a time, very frequently being compelled to start a load on slippery places, or be confronted by some unusual sight that would greatly frighten the average horse and yet tend strictly to business, is composed of the animals that the market is looking for so far as disposition goes.

I'll Stop Your Worm Losses
I'll Prove It Before You Pay

Don't let worms breed **contagious diseases** among your hogs this year. Don't let them kill off the young pigs and rob you of your season's profits. You can **prevent it** if you will just take "a stitch in time." **Now** is the time when worms begin to get in their **deadly** work. **Now** they are breeding, multiplying by the millions in the stomach and intestines, and if you don't get the best of them, they will surely get the best of you. Let me show you how. I'll get rid of stomach and free intestinal worms in your hogs, sheep, horses and cattle and prove it to your satisfaction (not mine) before you pay me a cent. I'll do it with

Beware of Imitations — SAL-VET — Look at the Name Carefully

The Great Worm Destroyer and Conditioner

I've done it for thousands and in addition they write me they never had stock thrive better, look better and bring them such profitable returns. Here is my offer to you.

Send No Money—Just the Coupon

Simply fill in the coupon, tell me how many head of hogs, sheep, horses and cattle you have. I will then ship you enough Sal-Vet to last them 60 days. You pay the small freight charge when it arrives—put it where all your stock can get free access to it—**and they will doctor themselves.** They eat it as they do salt—just as they need it, and at the end of the 60 days if you don't feel **satisfied,** write me and I'll cancel the charge. I take your word as final—I let you act as judge of its merit—I put everything up to you. How can you risk loss—how can you let your stock drag along when they should be thriving, growing into profit when such a fair, open offer like this is put at your disposal? You have all to gain—nothing to risk. Fill out and mail the coupon **now.** Don't put it off—lest you forget. Read the letters above.

Sidney R. Feil, Pres.—*The S. R. FEIL CO.*—Dept. AB Cleveland, Ohio

Prices: 40 lbs., $2.25; 100 lbs., $5.00; 200 lbs., $9.00; 300 lbs., $13.00; 500 lbs., $21.12

60-day trial shipments based on 1-lb. of "Sal-Vet" for each hog or sheep, and 4-lbs. for each horse or head of cattle, as near as we can come without breaking regular packages. No orders filled for less than 40 lbs.

(37)

I have been in the hog business for 30 years and have tried every known remedy for hogs, but have never found anything equal to your Sal-Vet. It certainly does the work and is easy to feed. I feed it to little pigs, boars, pregnant sows and find it O. K. I will never be without Sal-Vet.

C. F. MARSHALL & SON.
Per G. F. M. Monroe, Ia.

"I had a lot of sick hogs and I lost five of them. I began feeding them Sal-Vet, my losses stopped and the hogs soon got into a fine, healthy condition.

V. P. UNDERWOOD.
R. D. No. 1, Roachdale, Ind.

While I cannot say positively Sal-Vet kept my hogs from having Cholera, I had no such sickness while my neighbors almost without exception lost hogs from Cholera. I certainly have great faith in Sal-Vet and it is all and more than you claim for it.

J. C. CONOVER.
Chrisman, Ill.

I used your Sal-Vet regularly while feeding a bunch of fattening hogs and can say it is just the article. It made my hogs double their weight in 50 days. It is a great conditioner and worm destroyer—E. E. SHULL, LaCygne.

Sal-Vet always comes in original "Trade-Marked" Packages. Never sold loose in bulk or by the pound. Look for the "Sal-Vet" trade-mark.

Sidney R. Feil, Pres. The S. R. Feil Co., Cleveland, O.
Ship me enough SAL-VET to last my stock 60 days. I will pay the freight and report results in 60 days and will then pay for it if it does what you claim. If it does not, you are to cancel the charge.

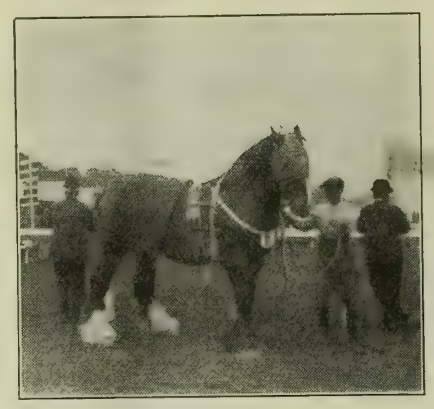
Horse Breeding With Capsules

In the discharge of the average stallion there are about eight ounces of fluid. In one drop of fertile semen there are countless numbers of spermatozoa. Only one of these is required to fertilize the ovum (female egg), the balance of the semen is wasted.

Artificial insemination was first employed in the human race. It was next used in the case of shy breeding mares, but now days it is used generally from a commercial standpoint. One good stallion can be mated with 500 mares during one short breeding season and get a better per cent of foals than was formerly obtained by the natural method.



During the early history of artificial breeding, many experiments were tried. The method which has given the best results during these many years includes the use of an extractor having a soft metallic point so that the semen can be obtained from the uterus after a stallion has served a mare. This semen, from a single discharge, may be divided, put in capsules and a dozen mares may be bred from one service. This was the basis of its success in horse breeding.

All of the early text books have taught that the discharge of a stallion was made in the vagina. This has been found untrue. In a majority of the services the writer has found the semen in the uterus from where it has been extracted for breeding purposes when good serving stallions have been used on breeding mares. About 20 per cent of the average mares on which the natural method fails have been made producers with the capsule system. Mares having a closed cervix will not fertilize without some assistance. Fertilization cannot take place unless the semen is deposited in the uterus where the spermatozoa can find its way up into the uterine duct (Fallopian tube), where fertilization takes place in the mare. There are mares having a diseased condition, or an acid condition in the vagina, that are perfectly normal in the uterus. These mares can frequently be fertilized with the capsule when the natural service would fail.

It is remarkable how the modern method of capsule breeding has spread over the country. Thousands of breeders are using the modern method of capsule breeding; it has found its way into foreign countries. There are some who are opposed to it. These are usually men who are not abreast of the times. But one question will silence any intelligent objector on this subject: "When fertile semen is discharged into the uterus in a clean, normal and healthy state, what more can any stallion or jack do?" There have been failures. This is due entirely to ignorance. Failures are not confined exclusively to capsule breeding. We believe every intelligent and progressive man should favor the most modern methods in this day and age. There is perhaps no other one thing in any line of business that means as much to the breeders of better live stock than the modern methods of capsule breeding. It is not confined exclusively to horses; several cattle breeders are using this system with high bred stock.

This plan is an advantage to the mare owner. It soon becomes common knowledge that mares can be bred each day at an advertised hour —say four o'clock in the afternoon. The breeding business unfortunately comes during the busiest season on the farm when every horse is used to the limit? It is not convenient at many times to take a mare at a special time when the natural service is employed. But if the mare owner knows that he can get a service any day promptly at four o'clock with the capsule system, that is what he wants. This is causing the mare owners to keep up a demand that owners of stallions and jacks must be more proficient in their work. There are hundreds of breeders who are collecting for more than one hundred colts per year, and quite a few who gets pay for 200 colts, from a single sire. If these men are doing this successfully, why is it considered impossible for others? The writer has on many occasions produced as many as a dozen colts from a single service of a stallion. There is no other method by which any certain higher standard of stock can be developed in even double the time because this one offers the opportunity of mating such a large number of females to the best stallion in a vicinity. If a number of mares can be fertilized at a single service a good sire can stand so cheap as to eliminate the only feature that we have to meet in competition with scrubs.

If the writer was looking for an investment of a few thousand dollars he would buy a good stallion—one of the best in the country. This horse would be stood for the same price as the scrub horses in that section. It is only a question of time until a majority of the best stallions will be siring many colts at a single service. If ten colts can be produced in one day from a good sire, at the scrub's price to insure a colt to stand and suck, how long will the scrub last against this competition? Owners of scrub stock are very antagonistic to this modern method. They realize what it means; that they must either purchase better sires or retire. With the capsule system well established if an excellent stallion would stand in a community at $10 to insure a colt to stand and suck, how many farmers would patronize scrubs? The owner of every good sire should study this system carefully and start a campaign of education among his patrons. The right individual will have no difficulty with an introduction of this kind if he starts right.

C. A. STANNARD, Box A, EMPORIA, KANSAS

Rules For Capsule Breeding

The capsule system is now being used by thousands of successful breeders. A stallion must discharge live spermatozoa in order to get colts either with the natural service or with the capsule system. (See first lesson in American Breeder School on "Anatomy of the Male.") The semen is taken from the uterus or vagina with the Improved Carlson Semen Extractor and immersed in warm water that has been boiled and cooled down to 100 degrees. The extractor should be sucked full of boiled water two or three times before it is used, and immersed in warm water a sufficient length of time to bring it to the right temperature, of 100 degrees. The body of this instrument is made of heavy brass, which maintains an even temperature best of the metals. The operator should have his hands thoroughly washed with soap and water before the breeding is started; he should have a bowl to catch the semen with in case any was spilled at the time of service. In case the fluid was caught in the bowl it should be covered immediately to keep the direct rays of the sun from striking it. The operator should get the fluid into the extractor as soon as possible after being caught, then immerse the extractor in warm water.

A helper should be instructed to have his hands thoroughly washed and to hold his finger over the point of the extractor and fill the capsules half full. In case too much fluid was run into the capsules, the suction can be pulled which will stop the overflow. All of the mares that are to be bred should be examined before the breeding is started so that the capsule may be inserted easily and quickly. Diseased mares should either be refused or bred with capsule last, so as not to carry any infection to the healthy mares. The owner of each mare is instructed to manage his own mare, and as the capsule is about to be inserted he shall hold up one front foot of the mare so that she cannot kick. The mare owners should be instructed not to interfere with this work because it is necessary that it be done accurately and quickly. Any funny stories should be told after the breeding operation is over.

Where several mares are to be bred a choice may be made for the natural service. This mare should be healthy, gentle and the tallest, as the tall mares are the ones on which the best services are made. The best capsules are pointed capsules made especially for this use; they should be kept in a box tightly closed and not handled at any time except when the hands have been thoroughly washed. The common, ordinary capsules purchased at the drug stores are not usually a success. Each breeder should have a few capsules in a separate box where they can be seen and handled so that the curious men will not interfere with the clean capsules. No grease of any kind should be used in horse breeding. Ground slippery elm can be purchased at any drug store and put in a clean, smooth can that has been boiled; punch a few holes in the top so that it can be dusted on the arm for a lubricant. It is best to have a jumper with the sleeves cut out which can be put on and used during the breeding operations. After the capsule is filled place the lid on it as quickly as possible, with a twist; close the hand around it so as to keep it warm and away from the light. The hand can be inserted into the mare with the capsule still in this position so as not to give the semen an opportunity to chill at any time. Have the mare owner pull the tail out of the road while inserting the capsule. These men are glad to help out if only asked.

Insert the capsule into the womb; only fill one capsule at a time and use it as quickly as possible; the capsule should have the cap taken off and laid on a clean towel that has not been used since being boiled. Every breeder should have a good supply of these towels and only use each towel once before boiling again. A shaded place where there is no dust nor current of air is sufficient for a breeding room; the nearer air tight and the cleaner it can be kept, the better. It is not necessary to have an expensive barn, but it is necessary that the capsule be filled in a shaded place. This is the only time that the semen comes in contact with the light; if the operator closes his hand around the capsules while inserting them the exposure to light can be reduced to the minimum.

It is necessary to have a large reservoir holding several gallons of water that can be boiled; a faucet with a cut-off valve is convenient for letting the water out of the reservoir to rinse the hands after being washed with soap and water. This should be boiled and allowed to cool so that the operator can get cool water to put in the pan when the water is too warm. Do not use any water for keeping the instrument in except what has been boiled; keep the thermometer in it, and watch the temperature. The pan containing the water where the extractor is to be immersed should be 40 inches long, eight inches wide and six inches deep. Any tinner can make it. Set it on a cracker box; cut holes in the top of the cracker box and place two small lamps under it, one in each

A French farmer working two stallions, the usual hitch in France. These horses stand for hours without being tied.

end. These lamps can be regulated so that the water can be kept exactly at 100 degrees for a great length of time. There is no difficulty about keeping the right temperature if this plan is followed. If the operator is careful about keeping the water at 100 degrees, and fills the capsules quickly, and closes his hand around the capsule to keep it the right temperature, and away from the light, and it contains live spermatozoa, and he inserts it into the mare, it is all any horse or jack can do. The capsule should be filled quickly when the extractor is taken out of the water, and the extractor should be put back in the water as soon as possible so not to let the semen chill. If the operator is not quick it is best to unscrew the long point from the extractor so that it will not have to run through so much metal, which might chill it. In fact, it is better to take the long point off. The helper can hold his finger over the end of the extractor just as well as over the point.

Unless a regular helper is there at each breeding it is a good plan to break in a mare owner by showing him how to fill capsules with water before the breeding operations. Then he will know just how to do it; explain to him that it is a delicate operation and that you are depending on him for this service.

Temperature is one of the big things; cleanliness is also necessary. There is nothing difficult about this work. If the ordinary breeder will study it he can be very successful.

A few have had difficulty in getting the semen. The improved Carlson Semen Extractor has a new point protector which makes it possible for nearly anyone to get the semen without any difficulty. (We would advise every breeder to practice on a mare a little before he is ready to breed mares. He may take sterilized water and inject into the uterus of an old mare and practice getting the water again.) The point protector referred to keeps the membranes from clogging the suction. One finger is inserted into the uterus with the point, which bends the point down to the lowest part of the uterus. There a basin is made where the fluid runs to the lowest part around the point of the extractor.

A nine-day mare has a larger opening in the womb so that two fingers may be inserted without any injury, to keep the membranes from clogging the suction. The membranes in the uterus of a mare that does not have a colt by her side are not so pliable. One finger is all that is necessary in a case of this kind. A nine-day mare is usually healthy. Make the suction just as slowly as possible. The large part of the extractor is so many times greater than the smaller part that it may suck too rapidly and cause the membranes to fill in the suction.

If a mare strains, just wait until she quits straining; it sometimes requires several minutes to get the fluid in a mare that strains hard. A little practice makes this work easy, but the operator should do some practicing before he is ready to breed, because if it is all new to him, he may be excited more or less and make a failure. There is no reason for anyone to make a failure in getting the semen with this instrument when breeding with a stallion. Sometimes it is a little difficult to get the semen from a jack, that does not discharge much semen.

In entering the mare with the extractor one can usually tell whether the semen is in the vagina or not. If it is in the vagina, get it there, if not, proceed on into the uterus. If for any reason the extractor should seem to pull harder than common it is evidence that the membranes are clogging the point of suction; push the plunger in a little and start over again. Occasionally a mare is found where the membranes are very pliable. In extreme cases it may be necessary to insert two fingers into the uterus to keep the membranes from clogging the suction. If the semen is not found in the front part of the uterus the cervix may be pushed forward a reasonable distance; do not push hard, just lightly; then the finger may be bent down with the point of the extractor and make a basin at that place. With a little practice this is easily accomplished.

Horse-Training and Colt-Breaking

Successfully Taught by Mail. Book Free!

Prof. Jesse Beery, King of Horse-Tamers and Trainers, Will Send Horse-Trainers' Prospectus FREE

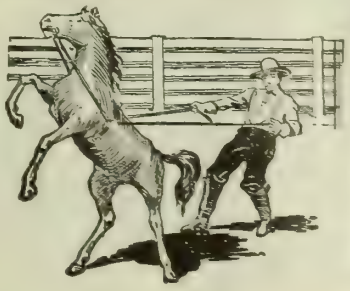
If you love horses and are ambitious to make more money, you will be intensely interested in the remarkable Horse-Trainers' Prospectus, which tells all about it. After a wonderful career as a professional horse-trainer, which brought him fame and fortune, Prof. Jesse Beery, acknowledged to be the World's Master Horseman, is devoting his time to teaching his noble profession to a few carefully chosen pupils, entirely by correspondence.

PROF. JESSE BEERY
World's Master Horseman

$1,200 to $3,000 a Year at Home or Traveling

Hundreds of Beery's graduates are making all kinds of money training horses, breaking colts, teaching horses to drive without bridle or lines. Owners gladly pay $15 to $25 a head to have their horses tamed, trained, cured of bad habits, or to have green colts properly broken. A good trainer can always keep his stable full of horses.

Is Your Horse Vicious, Tricky, Balky?



You can cure any horse of bad habits and actually double its value by this wonderful system. Everywhere are unruly, tricky, balky, dangerous horses—"not worth the powder to blow them up." These horses, by the Beery Methods, can quickly be made safe, useful, valuable.

Ignorance of the simple principles discovered by Prof. Beery has cost the lives of thousands. He tells his pupils the priceless secrets of conquering the most vicious "man-killers"—enables them to actually **duplicate** his most marvelous feats.

The Beery System Making Money for Thousands

Prof. Beery's graduates in all parts of the world are making money training horses, breaking colts, giving exhibitions, buying up cast-off "tricksters" and "man-killers," taming and training them and **re-selling at high prices.** For example, take the case of Emmett White, Kalona, Iowa, now a prosperous professional Horse-Trainer. Mr. White says: "I wouldn't take $500 for what you have taught me. You may judge of my success when I tell you that I have been able to buy **a home and an automobile** solely through earnings from training horses as taught by your excellent methods." A. L. Dickinson, Friendship, N. Y., writes: "I am working a pair of horses that cleaned out several men. I got them for $110, gave them a few lessons and have been offered $400 for the pair."

CLIP THE COUPON, sign and mail at once for the Free Book, written by a man who won fame and fortune, thrilling vast audiences everywhere, by marvelous skill in training horses and man-killing stallions. Send the coupon today. Tell him about your horse. (44)

Special Rates on Application for Advertising in this Department.

SNAP FOR STOCKMEN

$5 to $15 Per Acre.

For Missouri or Oklahoma lands, practically all in native blue stem grass, 50 per cent subject to cultivation, fine running water, two to eight miles from Kansas City Southern Ry., and only 200 miles straight run to Kansas City market.

Cattle and hogs are being raised and laid down on the K. C. market at less cost and greater profit than at any other point in the southwest. Pasturage most all year 'round. Clover, alfalfa, corn ,etc., make good crops. Ample rainfall. Most of land in native timber with fine grass.

BEST HOG COUNTRY IN THE WORLD

Stock hogs come from this section because they are free from disease and it costs practically nothing to raise them.

Fine climate. No bad blizzards or hot winds. Ideal country to enjoy life and make money. This same land put in fruit is netting annually $100 to $150 an acre. Tracts of several hundred acres or more at $5 to $15 per acre. For particulars address **Wm. Nicholson, Immigration Agent,**

KANSAS CITY SOUTHERN RAILWAY, 671 Thayer Bldg., Kansas City, Mo.

IRRIGATED FARM LAND.

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southeast Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Oats yields 30 to 80 bus.; wheat, 20 to 60 bus.; barley 30 to 80 bus.; potatoes 150 bushels and up; beets highest sugar content; alfalfa 4 to 6 tons per year and all grasses do well.

The climate here is exceptionally good.

Mining towns make good markets. Eggs average 30c; butter never less than 30c; oats $1.25 and up, per hundred. For good values in land, or any dred. Gor good values in land, or any reliable information, write

W. L. Morse, Mancos, Montezuma Co., Colorado.

Must Sell---Sacrifice

160 Sumner County. Highly improved; close to town; 40 acres alfalfa; 60 pasture; excellent farm. Information LOCK BOX 285, WELLINGTON, KAS.

160 ACRES OF HAY LAND

for sale or trade for pure bred horses; Percherons; mares preferred. Price $20 per acre. **F. D. Maddex, Arcadia, Neb.**

"REAL ESTATE WANTED."

Sell your property quickly for cash, no matter where located; particulars free.—Real Estate Salesman Co., Desk 9, Lincoln, Neb.

PECAN VALLEY FARM

For sale; 162½ acres, deep, rich, black soil. You can't beat it. Come and let me show you, or send for description. **Sam Avard, Hawthorn, La.**

RED RIVER VALLEY LANDS

For sale and exchange. For information write **J. J. W. Dvorak, Wyndmere, North Dakota.**

CATTLE AND SHEEP.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

A few bulls of extra quality. A few young Poland China boars. Inspection invited.

C. H. WHITE, Burlington, Kas.

GOOD SHORTHORNS

Reds and Roans.

1 car load of bulls for sale.

1 car load of heifers for sale.

These are rugged, blocky, good feeders—the kind the country needs.

H. C. Lookabaugh, Watonga, Okla.

SHROPSHIRE SHEEP.

I have purchased from G. W. Patterson his entire flock of high class Shropshires. I have more than I need and will sell one or two carloads of the breeding ewes. Also have lambs for sale by McKerrows 1834 (07133 R), the sire of 81 first prize and championship winners at World and State Fairs. For prices and particulars write **H. Schofield, Worthington, Nobles County, Minnesota.**

A MARE THAT STOCKED A FARM.

To the American Breeder:—Notice in your last issue that you are publishing short stories of mares that have been proven great breeders. I take the liberty of writing you about Georgiana, a mare whose record, I believe, has seldom been equaled.

Georgiana is a pure bred Percheron mare that in show condition, weighed over a ton. She was good enough in her day that she was first in class at one of the great Iowa state fairs. She is still ilving and is absolutely sound today. She worked hard until she was 17 years of age and foaled three times in harness. As a brood mare, she produced 18 living colts, one right after the other without a break, all of them ton horses or better, three of them state fair winners, one of them weighed 2,560 pounds.

Her daughters are keeping up her remarkable record; one daughter already having produced 12 colts without a break. If anyone has a mare that can beat this record, we should be glad to hear about it. So far, we have never heard of any pure bred that has equalled this wonderful record.

All the Percheron horses on our farm are all the direct female descendants of this grand old mare, and we believe in this family, we have one of the greatest families of the Percheron breed as brood mares, work mares, and show horses.—Woodlawn Farm Co., Whiteside County, Ill.

THE "MORTGAGE LIFTER" ENTERED.

To the American Breeder:—I have an O. I. C. sow registered as Ozark Bess 37005; she has given birth to four litters of pigs, one of 13, two of 15 each, and on February 13 she farrowed 16 pigs. This makes a total of 69 pigs in four litters. I have been in the hog business for about 15 years but this white sow beats them all. She is a large sow and an excellent feeder.—M. W. Magnusson, Maries County, Missouri.

Shorthorn cows going to the ring in a popular live stock show in England.

COST OF RAISING GRADE AND PURE BRED COLTS.

To the American Breeder: It is supposed among some horsemen and farmers that it costs more to rear a pure bred colt than to rear a grade. The animal husbandry department at the agricultural college has begun an experiment to try out this question this winter. Prof. W. A. Cochel has selected twenty colts, ten of them pure bred Clydesdales, Percherons, Belgians and ten grades of the same breeds. One lot is to receive oats, alfalfa hay and corn fodder. The other lot will be fed in such a way as to receive the same food nutrients as if oats had been included. The lot receiving oats and alfalfa hay will get its corn fodder while running in the pasture.

All the colts are fed in an open shed and during the day are kept outside in the pasture. Their coats are heavy and they are in the best of condition. The lots are divided this way; five pure breds and five grades, five fillies and five horses. The question to be answered is: has a pure bred the same opportunities to develop as has the grade, or is it as much a matter of feeding as of breeding? Some of the colts are imported and some are home bred. The experiment throughout will be as ordinary as if any farmer in Kansas were conducting it. Careful records will be kept and results published at the proper time.—Charles Dillon, Riley County, Kas.

HORSES IN A FIRE.

The owner of valuable stock especially should spend some time thinking about what he would do in case of a fire. The average individual is usually excited in case of fire, and does many things that he would not do if not excited. Every breeder should study his own surroundings and figure out the things he wished to do first in case the barn should get afire and be beyond control. Every breeder should have a place where this stock could be taken out and tied quickly. As a rule, horses must be led out, as they will not leave their home very quickly; some of them will stay in the barn and burn, even though they are loose.

It is necessary to have a place where stallions or jacks can be tied. One frequently sees a barn so situated that if a fire would break out at the main entrance it would be impossible to remove a single animal. A breeding barn is a hazardous risk at its best as there is usually hay and other material scattered about that will catch fire easily. It is visited by all sorts of men—some very careless. Many fires are started from matches being dropped here or there, and an animal stepping on a match may ignite it, which may result in the premises being destroyed. Every breeder should have up a sign, "No Smoking," and the owner should set the example by not breaking the rule himself about the premises.

If it is necessary to have fire about the place it would be profitable to use matches which are sold in small boxes that cannot be ignited except when they are scratched on this particular box. These matches are not very dangerous, and they are very cheap. Everyone knows that there will not be any fire unless a fire is started. A match is the easiest and quickest way of starting a fire. Occasionally where a stove is used in a barn one is liable to get careless about the flue, or he may allow inflammable material to accumulate in such a position that a fire is easily started. A little thought along this line at the

IMPROVE YOUR STOCK

proper time might be well spent. After the barn burns, and a great loss has been brought about, it is too late to think then.

RUSHING STALLIONS.

One of the most disagreeable things in the breeding business is to have an uncontrollable stallion. They are dangerous to both man and beast, and unnecessary. Any man can handle any stallion if he knows how. Every stallion should be taught to walk up to within a reasonable distance of the mare and stop and wait for the signal to make the mount. Some one will say, "I would like to see anyone take my stallion and do that." There is not a stallion living that has a normal head that the writer cannot do this with within a very short time. He has handled many of them.

The first thing necessary is to get a bridle that will control them. The best bridle for this purpose is a "Conqueror" bridle. This pulls right up in their mouth and the harder they pull the worse the bridle will cut. Take a stallion out around other horses and teach him that you are the master of the situation. Begin early by getting a mare that is in heat and practice with your horse every day until he minds you. Take him up to a certain place where he is expected to stop, and stop him with this bridle; teach him that when you say "Whoa" that you expect him to stop absolutely still and remain stationary until you give a signal for him to mount. Take him to this place several times the first few days and stop him and lead him away and repeat this a few times. After his mouth gets sore enough you can handle him. This is the only way to handle them.

There is one difficulty with the "Conqueror" bridle and that is that animals must not be tied with it as it will injure them. After the stallion with this new method of serving, the "Conqueror" bridle may be dispensed with, but if he shows any signs of going back to his old habit, it should be used again. One should be careful not to go to the extreme, as this method is very severe and it might result in making a timid server. Judgment must be used in this the same as in all other things. A great many stallions get injured themselves. Mares are frightened and occasionally injured. One of the most serious things is that the owner of the mare who is usually holding the mare, gets frightened, turns her loose and then all is excitement. Then word goes out that a certain breeder has an uncontrollable stallion and it is not advisable to take mares to that place because it is dangerous, which is not a very good drawing card for business. There are not many men who wish to take the chance of getting their mares crippled and more of them who do not wish to get crippled themselves.

Just a little time along this line will make this part of the business satisfactory instead of dangerous.

BARREN MARE IMPREGNATORS.

I have seen an advertisement of the "Barren Mare Impregnator" that has a bag attachment that goes into the uterus. It is supposed to hold the mouth of the womb open so that the discharge will be caught in the bag. The advertisement states that all the fluid will be caught in this bag each time. The party advertising this Barren Mare Impregnator said some years ago that it was dangerous to take the semen from the womb. "I would like to know what you think of this Barren Mare Impregnator?"

There are not many stallions that will serve a mare with an instrument in the neck of the womb. Valuable stallions have been spoiled from such arrangements. A cervical plug was made some years ago that also spoiled numerous individuals. These arrangements are similar to the dilator impregnator which has no value for the breeders but only intended to catch "suckers." The Barren Mare Impregnator that you describe is dangerous to use; if it does not ruin your stallion or jack it is too large to put in the cervix of the average mare —it is also difficult to keep clean.

If the discharge went into this bag, as advertised, it would be about eight ounces of semen. How could it be gotten out without causing some damage? It is quite likely that the advertiser will instruct you to use the bulb impregnator to get this fluid.That impregnator has a long, fine rubber hose and there is no way of keeping it at the right temperature, as the semen would be sucked out of this bag into the bulb impregnator which would chill rapidly; the long rubber hose would serve as a radiator to cool the semen. The bulb impregnator will not stand boiling to be thoroughly cleaned.

Colts have been produced by this bulb impregnator, and in fact by nearly every known method has produced a few colts. What the breeders want to do is to get a good per cent of colts. This cannot be done unless the operator is clean and maintains the right temperature. Breeders' bags have also been advertised and used extensively. Many stallions and jacks have been ruined by their use.

There is only one successful way to breed mares without a natural service, and that is to have a metal instrument with a soft metallic point. By this plan semen can be taken from the mare without any danger, either to the mare or to the stallion or jack. The semen can be divided and put into capsules, filling one capsule at a time, with excellent success. Metal instruments can be boiled and kept clean. Each capsule is used only

Secretary Hynderick of the Belgium Stud Book and his friends at the Brussels horse show. This building is large enough for ten different categories (classes) to be shown at once. These mares are valued at $2,000 each and average in weight about 2,400 pounds.

Importers of BELGIAN and PERCHERON STALLIONS AND MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars, mentioning this paper.

Pioneer Stock Farm

The Home of the Belgians.

We have for sale the classiest bunch of imported and home-bred stallions and mares we have ever offered for sale. Got first premiums and grand championship in every class we showed in at two state fairs; eight firsts and two grand championships at Oklahoma City and 12 firsts and four championships at Hutchinson, Kas. Any one desiring a first class stallion or mare will do well to see this fine bunch and get prices.

DAVID COOPER & SONS,

Freeport, Harper County, Kansas.

once, and it is clean, so there is no chance for infection.

The so-called Barren Mare Impregnator, Dilator, Breeders' Bags, and all other rubber goods should be dispensed with in artificial breeding. They have no real value. It is this kind of "dope" sold to the horse breeders, with great expectations, and advertised to be easy to use, that has caused so much difficulty and so many failures in artificial breeding. The sooner the breeders learn that these things have no real value, and get on a solid basis, the better it will be for horse breeders.

OPENING MARES.

It is amusing to see some horse breeders open mares. There is a class of men who never read, that are doing a world of damage to the breeding industry. It is not uncommon to see a breeder have a bucket of lard or grease so that he may stick his hand in this material before inserting into the mare. He does not perhaps realize that this material is a great culture for germs and that it is being inoculated daily with fresh infection. There are others who use soap. All of these agents are injurious to the mucous membranes of the mare and should not be used. Ground slippery elm is very good, but before it is used the hand should be washed with good soap and water—thoroughly washed—and rinsed in sterilized (boiled) water. Every breeder should have some means of boiling water; it should be put in a receptacle that has been cleaned; a faucet should be located so that a little water could easily be let out to rinse the hands without contaminating the whole barrel.

Great care should be taken not to open the cervix of a mare which is pregnant. We cannot place too much stress on this particular feature. We are of the opinion that nearly every uninstructed breeder causes numerous abortions each year. If a mare has been bred and returned three weeks or six weeks later, showing some signs of heat, we would advise being very careful about opening the cervix of this mare without first taking a speculum and looking at the cervix. Soon after conception takes place the cervix fills with a mucous plug and a little practice with the speculum will enable a breeder to determine quite accurately whether the mare is pregnant or not. It would be a good plan to make numerous inspections of different mares so as to get this knowledge well founded in one's own mind. The great difficulty about opening mares with the hand is that even though the cervix is not penetrated it may break so that the mucous plug will be cracked. In that case germs enter these cracks and liquefy the mucous plug; then an abortion is sure to follow in nearly every case.

Experiments have been carried on within the last two years that justify these statements. After a mare has aborted, even though it be very early, it is difficult to fertilize this mare, as a rule. We have come to the conclusion that every breeder should have a good speculum, not only for making examinations of this kind, but for the examination of barren mares. This will be explained more fully in the April 5th issue. The speculum should be about 15 inches long, made of metal; glass speculums are not a success because they are easily broken; that is, a nick may be made in one of them which may not be noticed, yet it will lacerate the membranes quite frequently—neither can they be kept as clean as a nickel plated speculum. The speculum should be rinsed in sterilized water after being used.

About ten per cent of pregnant mares will receive the embrace of the stallion sometime during pregnancy without much objection. Occasionally a mare will show some signs of heat and then deliver a foal in a short time. A speculum will often diagnose these cases. A record should be made of the condition of the cervix at the time of breeding. The service record book should have notations indicating whether the cervix was loose or closed at service. After a few months of pregnancy the cervix seems to get shorter. Near parturition an exploration of these parts reveals the fact that the cervix is very small and short, which quite frequently looks like a small walnut.

We would like to impress upon our readers the necessity of being more careful about opening mares. Every mare that has not got a colt by her side, however, should be examined. In this day and age every breeder should be able to diagnose the exact condition of a mare; he should be able to give an exact reason for each mare not fertilizing.

We hope all our readers will get interested in the school which will be conducted in the American Breeder. It is just as easy to be a leader as a follower.

STALLION FEED.

Before the breeding season starts, owners of every good sire should lay in a supply of feed. This feed should be of good quality. It should be free from mold or smut. It should be kept dry so that it will remain in good condition. A few dollars spent in the right kind of feed is always a good investment, because no one can afford to take chances of running out of feed and be forced to make a radical change during the season. Oats should be the principal ration. No other feed can produce the same physical ability. If alfalfa or clover form a part of the rations, it should be well cured, especially alfalfa. Early cut hay is trying on the kidneys if not fed very sparingly. If the animal does not masticate the food thoroughly, the teeth should be examined by a qualified veterinary dentist. The condition of the bowels should be a guide as to the amount of food given.

VALUABLE INFORMATION WASTED.

In this day and age the activity of men is specialized more or less. There are some who are interested in very limited subjects. Even among horse breeders we find some who do not wish to go into the details, but would rather use the stallion business as a "side line." These men do not care to spend any time seeking more information; they would rather follow the same old rut. But the time is coming when these men must study their business closer or let someone else run it.

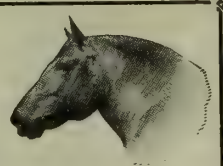
We have sent sample copies to men of this kind; they have glanced hurriedly through them and laid them aside. They did not go far enough to see that a lot of this information was prepared especially for men of their business. They supposed that we had sent them a sample copy just to get the paper out somewhere. This is not the case. The American Breeder has no free list; when a sample copy is sent to an individual it is because we can help him and is meant for a direct invitation to become a subscriber. If he does not subscribe he will not get any more. We have sent sample copies to men who were not interested in horse breeding; they have handed them to others who were and who have been thankful ever since that such a paper existed. There is probably not a stallion or jack owner in the country who would not be glad to receive this, or any other issue of the American Breeder, as a sample copy; who would not be glad to know where to get such a paper. Thousands of men who own mares only would be glad to receive an introduction to the information we are putting out.

Shy breeding mares are getting to

English Shire stallions at a show in England, valued at over $4,000 each.

PERCHERON, BELGIAN, SHIRE
STALLIONS AND MARES—MOSTLY IMPORTED

Big, rugged, good conformation and straight movers. Black and gray Percherons; sorrel and bay Belgians, all solid colors, weighing from 1,800 to 2,200 pounds. All state inspected. **We do not handle any culls.** Our horses are all sound, therefore we do not fight the stallion law to sell them. Of course we can buy blemished stallions as low as 15 cents on the dollar, as well as any one else, but if we want to raise sound horses we have to buy sound sires. They will do the owner and the farmers some good.



We were born and raised in France and keep in communication with the breeders there, buying for the lowest dollar that will possibly get the good ones. We have sold 42 horses in less than 20 miles square, right here at home, and have shipped horses over 1,400 miles away.

If you are looking for a **reliable** stallion or mare we can suit you. Come and see us.

be a "burning issue." These men can learn for themselves what the difficulty is. If every one of our readers would make an effort to show some other breeder this issue, the circulation would be greatly increased. We would like to ask all our readers to ask other breeders if they know about the American Breeder, and converse about it. It is the duty of everyone interested in horse breeding to assist in the upbuilding of this publication, because it is run in the interest of the breeders—a statement that any publisher ought to be proud to make.

A common scene on the streets of Paris. No other city in the world permits horses to be abused as much. One horse is led and the other directed with a jerk line.

PROFANE LANGUAGE.

Around the breeding barn, where all classes of men congregate, entirely too much profane and vulgar language is used. The average breeder perhaps never realizes how much business is moved away from his place by the use of these terms. There are many individuals who will not patronize a place of this kind; those who are opposed to this language do not require the use of it. Quite frequently boys of a tender age are in the company of these men, and this lesson is not beneficial to them in any way. Owners of good mares frequently send their stock with their boys to a place where this language is not used, even though the stock is not as good.

There is no one thing that the average breeder could do to a better advantage than to stick up a sign in a prominent place where all could see it, "No Profane or Vulgar Language Used on These Premises." Then the owner of this place should set the example himself. Each of us is being watched by some one else. It is a mighty poor man indeed who does not have friends and followers. It is the duty of every one to set a good example for the rising generation at least.

Another good feature would be to have on all bills and advertising, "No Business Done on Sundays." If each one will labor to the best of his advantage during the week it will not be necessary for any one to work on Sunday. This policy has a financial value in the business world, as well as setting a good example for those with whom we associate.

NAVEL ILL.

Navel ill is a term applied to the condition of the cord at foaling time. If germs make entrance into the colt at, or about, foaling time, it may develop one of several conditions, all of which are due to the infection. This can easily be prevented by using a drying powder on the navel cord.

There is very little use of losing any colts from the so-called navel ill. It is ignorance, as a rule, if colts die from this condition. It costs little to prevent it. More colts die from this infection than from all other causes. The germs may locate in a joint, which will lead the owner to believe that the mare has stepped on it; or it may get weak in the back; or it may have the scours; or it may urinate through the navel, or many other symptoms. A treatment will be given in the April 5th issue for navel ill. There is only one successful treatment for navel ill, and that is to prevent it. There are serums and bacterins that can be injected into the colt, but these are expensive, and a cure is not always the result. We want our readers to pay particular attention to the article on this subject, which will appear in the April 20th issue. There is no use to give a lot of drugs to try to cure these conditions. The thing to do is to prevent it. Anyone can do it. Navel ill is a big subject, and it will be one of the lessons in the American Breeder School.

PREPARING FOR SERVICE.

The stallion should be prepared for service if the best results are to be obtained. His general health should be looked after. A reasonable amount of exercise should be given, but this should be started early and gradually increased up to a reasonable amount. It is not advisable to begin the extensive work too rapidly. One of the most injurious methods of horse breeding is to begin the service too rapidly. One mare should be bred the first week, two the second week and three the third week. Then they may be started a little more rapidly. It is best to give away a few early services, just enough to get the stallion in good condition. Where a stallion is not allowed any service and then started in two or more mares a day, much injury is often done. As the services increase, the feed should increase in order to have the animal make a gradual gain in weight if possible. We have often thought that an important thing in maintaining the condition of a stallion is to screen the stall, especially where a docked horse is used. It does not cost much and the horse will get more value from his feed if he is not bothered with flies too much. It is necessary to see that a stallion or jack digests the food properly. Any excitement or annoyance, at or about meal time, is not beneficial, and in many cases, a serious detriment. When mares are being bred and teased, a stallion especially, is more or less excitable, a condition requiring care, if gains are made.

A self-feeder is an excellent improvement in a stallion barn. That is, a self-feeder for stallions and jacks, especially those that eat rapidly, or root the feed out. This can only be used with ground feed or small grain, or shelled corn. A container is built above the feed box in the way of a spout, leaving about one inch space for the feed to run into the feed box. This is very easily done and is one of the best investments, not only in a breeding barn, but perhaps for any horses, jacks or mules. This forces them to eat slowly, and they cannot throw out much of it. They will get the full benefit of their feed, and it will afford the proper time for the entire mastication.

The animal should be cleaned up,

An omnibus used by tourists in large European cities. The upper deck gives a good view, besides being very comfortable in nice weather.

TRUMANS'

CHAMPION STUD

The world's greatest collection of Shire Stallions and Mares, Percherons and Belgians to suit the most critical buyers; Hackneys of Richest Breeding and Strongest Individuality.

Fifth 1912 Importation of Shire and Percheron and Belgian Stallions arrived Oct. 29. Thirty-four years in the business and not one dissatisfied customer.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us.

Address for illustrated catalogue and other information, mentioning the American Breeder.

Trumans' Pioneer Stud Farm

Bushnell, Illinois

Percherons and Royal Belgians

We have decided to offer all of our state fair prize winners—22 stallions and mares—for sale. Every one of these horses have been shown and has been a prize winner at the shows of 1912. These stallions and mares will be sold at exceedingly low prices, quality considered.

We are showing some other good stallions and mares, which we offer at prices that defy competition.

We earnestly request you to look over our stallions and mares before buying.

True photos from life on application.

Address,

Four Royal Belgians imported by us in 1912.

WOLF BROS., Importers and Breeders. Boone County, ALBION, NEB.

TAYLOR & JONES

Williamsville, Sangamon Co., Ill.

Our new horses are now in the barns, and we have an extra good lot of Belgians, Percherons and Shires. We invite buyers to call and look them over. We buy the best we can buy, and if there were any better to be found we would handle them. Our guarantee is safe, and we can protect a buyer from loss for the full purchase price. Come and see us. It won't take long or cost much, and we feel sure we can save you some money.

TAYLOR & JONES, Williamsville, Sangamon County, Ill.

Lincoln, Nebraska

For Quick Sale

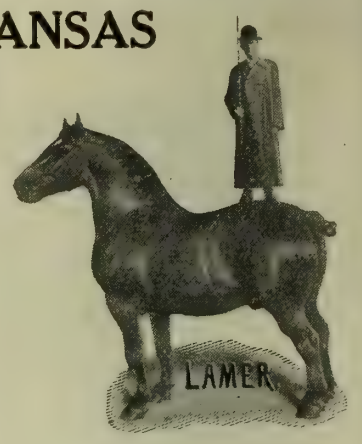
..One Percheron stallion; registered; black; nine years; a ton horse; guaranteed and priced right.

One jack five years old; black, light points; 14½ hands. Two coming one year old jacks; also my herd jack, black, light points, 15½ hands; weight 1125, and seven jennets in foal and two yearlings. Would exchange for registered mares or good grade draft mares. Could use young registered saddle horse. **Phil F. Simmons, Elmdale, Chase County, Kas.**

with the mane and tail straightened out, so he will make a good appearance. The sheath should be looked after, and cleaned with the bran mash preparation. This is the only way to clean the sheath of a stallion. No lard, grease or soap should be used. The stallion should be handled around horses and mares enough that he would make a service without any injury to either man or beast.

ANOTHER KIND OF "DOUBTFUL BREEDERS."

There is one class of men in the breeding business who are of the opinion they cannot learn the latest method in horse breeding. The writer has talked to men on these subjects who have said that they could not understand these great propositions and would not even try to learn. There is a lot of necessary information that can very easily be handled, if the average breeder will simply try, but if he will not start, he never can expect to be a successful breeder. Some of these men have even been offended at the management of this paper, because we have tried to explain these things.



We do not know why an individual would object to being taught how other men conduct their business successfully, but it is an absolute fact that some breeders have actually stopped taking the American Breeder because it advocated better methods in horse breeding. It would seem to us that this material would be interesting to any breeder, regardless of whether he ever expected to use it or not. We should think they would be glad to know that successful men were making great progress. One breeder recently stopped his subscription and said that he did not want to take a paper that did not agree with him. He further stated that he had been controlling the sex by breeding the mare at four o'clock in the morning for filly colts. We should think that this breeder would be glad to have the opinion of other men on other subjects, even though he was satisfied on the subject of controlling the sex. We do not believe that anyone can control the sex successfully. Does this breeder believe that by stopping his subscription, because we do not agree with him on some particular subject, that the American Breeder will cease to exist? Even if he knew it all on this one subject there are other departments that are valuable to this man. In fact, a lot of information that he cannot possibly get anywhere else at any price.

One does not learn much from the association of men who agree with him in every particular. This is also true of reading publications, but the principal thing in horse breeding is to have a set of scientific men who are in a position to carry on experiments and test these different propositions, and know why certain conditions exist. There are a lot of men in the breeding business who do exactly as their grandfathers did, and when asked why they do it, they simply state that their fathers and grandfathers did it and the old method is good enough for them. For instance, there are a lot of breeders who throw cold water on the mare im-

Boulonnaise horses shown at the Paris exposition.

LAMER'S
PERCHERON SALE
SALINA, KANSAS
THURSDAY, MARCH 13TH
50—HEAD—50

Consisting of:

A fine coming three year old Percheron stallion; Brilliant breeding. Use him and have him growing into money at the same time. Pedigree and photograph on application. Priced to sell. **Leon E. Tompkins, Palatine, Cook County, Ill.**

THREE PURE BRED PERCHERON

stud colts for sale; eight, nine and 12 months old. Also one pure bred Percheron stallion, five years old; weighing one ton.

J. G. RICHARDS, Struthers, Ohio.
Mahoning County.

FRENCH DRAFT STALLION

for sale; four years old past; 1800 pounds now in common flesh; he ought to make a ton horse when full grown in his old clothes. Lots of good colts to show, and mares in foal. Will sell him cheap for cash, or trade for a good Belgian or Shire. **M. P. Lydon, Cresco, Howard County, Iowa. Rte. 1.**

mediately after service, which is one of the very worst things that could be done. A nervous shock to the female system immediately after service is unfavorable to the fertilization. There are more of these breeders in the country than one would imagine, without considerable traveling, but the great wonder is that these men absolutely will not read or try to learn anything about the successful methods that other men are using.

This does not apply to the capsule breeding particularly, but to many things, and especially that of breeding diseased mares with the natural service. These individuals can usually be heard to say that the breeding business is not profitable; that they cannot own a good stallion or jack because they cannot collect enough money. Just so long as they wish to remain ignorant and not learn what other breeders are doing, just that long their business will not be profitable and they will maintain inferior breeding stock that are not profitable to them or their community.

STALLION LIFE INSURANCE.

The life insurance companies which carry the risk of valuable stallions usually charge about ten per cent. This would not be unreasonable for race horses that are shipped here and there and compelled to extend themselves to their utmost, but we do contend that this is an exorbitant price for registered draft horses. The insurer would be glad to pay this rate

A Clydesdale gelding drawing a load of two tons on the streets of Glasgow, Scotland.

if he had reason to expect that out of ten horses one would die each year. We do not believe that one out of thirty would die each year when the risk is properly taken.

One of the objects of this article is to make it possible for buyers to purchase registered draft horses. There are about 250 breeders and importers who are selling horses extensively in this country. If each of these were to subscribe for a reasonable amount of stock it would form one of the strongest organizations in the country, and the price could be made so reasonable that it would not require any traveling solicitors, and would save the company, and the patrons, from twenty to forty per cent in that one item alone. There would be enough members to recommend it and work for its advancement. Then it would only be a question of time until nearly all of the registered draft horses would be insured in that company. The volume of business would be large enough, with practically no expense except an office force to give it prestige.

We believe that an association of this kind could insure registered draft horses (by limiting the age to ten years) for half of the present rate of insurance. There are not many who care to carry insurance on stallions or mares after they are ten years of age. The great demand for life insurance is where a stallion has been purchased at what the purchaser thinks is a high price. By accepting only registered draft horses in recognized associations there would be less opportunity of misrepresenting the insured animal, as the breeder or im-

COMBINATION BREEDERS' SALE

AT MIDDLETOWN, HENRY COUNTY, INDIANA

SATURDAY, MARCH 15TH, 1913

Twenty registered stallions and mares, Clydesdales, Percherons, Morgans and Standard bred.

This lot includes many stallions of outstanding excellence and breeding.

Among the Clydesdales will be a son of the champion, Refiner, by Baron's Pride. Among the mares will be the good breeding mare, Maggie Charming, weighing 1,850 pounds; bred to the noted Refiner, and safe in foal.

All stallions of breeding age have been tried and proven themselves breeders, and will be shown in breeding condition.

Among the Standard breds is the noted stallion, Harry U. 46842, by Argot Wilkes 2:17¼ (P) 17559; first dam Lucile, by Meridith 1367, by Hambletonian 10; a horse with quality and breeding the best; also the great show and breeding stallion, Dorsey Morgan 466 M. R., 34232 A. T. R.; a very handsome horse.

Also some high grade roadsters, geldings and mares.

Terms of Sale:—Cash or six months credit will be given where purchaser gives bankable note bearing 6 per cent interest from date.

Sale will be held at the Big Four Livery Barn, rain or shine. Sale to begin at one o'clock. Catalogue ready March 5th. Write for one, mentioning the American Breeder.

Auctioneers:—Col. Fred. Reppert, Col. Wm. Flannigan, Col. Hector Kirk.

JOE V. PAINTER, SALES MANAGER, MIDDLETOWN, IND.

Middletown is located on the Pennsylvania Railroad and the I. U. Traction lines, 10 miles southeast of Anderson, 14 miles southwest of Muncie, 14 miles northwest of New Castle and about 40 miles northeast of Indianapolis.

Excellent hotel accommodations, at reasonable rates. Remember the time and place.

PETER HOPLEY & SON,

ATLANTIC and LEWIS, IOWA,

Importers of PERCHERONS and SHIRES

We have been making from one to three importations a year since 1884 of the best stallions and mares that we could find in France and Great Britain. **We have now the best lot of both breeds** of stallions and mares, nearly all two-year-olds, that we have ever had on our farms at one time. **They excel in weight, bone and quality.** We have two-year-olds weighing in moderate flesh **up to 1,950 lbs.** We have secured a number the get of the most noted sires in France and Great Britain. **We have a number of top show horses.** We want you to come and look them over, and you will agree that what we have said is conservatively stated, and in spite of our selections we are able to quote very moderate prices. Remember, our horses are all kept at the farms between Atlantic and Lewis, on the main line of the Rock Island, 60 miles east of Council Bluffs.

IMPORTED STALLIONS

PERCHERON
SHIRE BELGIAN

Each year we show our New Importation the same month they land; each year they win more than all other exhibitors combined. At the American Royal this year we won 2nd on 4-year-old Percheron, 1st, 3rd and 4th on 3-year-old; 1st and 3rd on 2-year-old and 1st and champion on group of five stallions. All are for sale. Our guarantee and insurance are the best. Our horses the best.

PERCHERON IMPORTING CO. CHAS. R. KIRK, SOUTH ST. JOSEPH, MO.

PERCHERON, BELGIAN AND SHIRE

STALLIONS, IMPORTED AND HOME BRED. 3 to 4 years old, maturing 1800 to 2400 pounds. No finer lot in America. Prices and terms reasonable. Barns in city.

Lew W. Cochran, Office 205 Ben Hur Bldg., Crawfordsville, Ind.; Fort Morgan, Col.

porter would probably have some knowledge of the animal described in the application. This would remove, to a great extent, any temptation to misrepresent. The stockholders in such an association would not be anxious to receive large dividends, for if the association was self-supporting it would be a good thing for the best interests of the breeders and users of registered draft horses. The life insurance companies that recognize high class breeding stock are either so eager for business that they are accepting hazardous risks, or they are charging too much money, or it costs them too much for traveling solicitors to get applications.

A draft horse life insurance company if it could limit the age and require certain preliminaries before an animal would be accepted, could greatly improve the present conditions. There are now a number of reputable life insurance companies that carry policies on high class stock—some of these pay the full premiums while others do a "scalper's" business. There are also several propositions that are sometimes called grafts. There is one operating in this city that is said to be a genuine graft. When any association has its rules and regulations so constituted that it can loan its surplus money at two or three per cent interest, it is evident that it is making an enormous profit, after paying the many high salaries, some of which are padded and unnecessary. If an association was formed that would only insure half or two-thirds of the full value so that the owner of the stock would have an interest in the loss, and to place a limit of $800 to $1,000 on the highest priced ones, the ordinary temptations of fraud would be greatly eliminated. This association might require an animal to be insured for three years. We would say, for instance, that if a stallion was insured for $800, charging a five per cent premium, this would be $40 a year.

If this plan is satisfactory, why not arrange for a meeting at some state fair where plans may be discussed? We would be glad to hear from those interested.

THE KIND WE INTEREST.

To the American Breeder: I am very much interested in fine stock breeding and get lots of good advice and information out of your paper. It costs very little more to raise a good horse or mule than it does a scrub, and there is three or four times as much profit in good stuff. I paid $15 for a season on a fine company jack we have and sold colts at weaning at $80, while some of our neighbors thought the season too high and paid $8 to breed to a scrub and sold their colts at $40 to $50. So figuring on selling at weaning time, my colts paid the season and left me a profit of $30 or $35 above my neighbors, and the profit is just started, for my $80 mule at four years old will bring from $200 to $250, while the $40 mules won't ever bring more than $100 to $125. This scrub raising is a thing of the past with the progressive farmer if he aims to keep in line with what the world demands, for the world is demanding a better grade of every kind of live stock. Land and grass are getting so high that people can't afford to raise scrub stock of any sort. If the farmers and stockmen will only wake up they will realize that they are the greatest people in the world, and when they see their own importance in the world, then the banker, merchant and every other class of business will begin to take off their hats to us, for we are the producers and they are the consumers and they can't consume it until we make it. So I feel that we are the "bull wheel" of the whole business and am proud of the farmer and stock raiser and Hurrah for them, for I am one of the number—C. W. Robinson, Jones County, Texas.

THE BEST PERCHERONS.

Stephen H. Rogers of Claiborne County, Tennessee, sends in an inquiry concerning the best Percherons. We should like to have our readers give their opinion on this subject as they know them. This should be very interesting to every one familiar with Percheron horses. The questions are as follows:

Which was the greater animal, Brillian I or Besique I?

What Percheron stallion is now, or has been, the greatest Percheron stallion owned by the American people?

Which are the best six Percheron stallions in the United States at this time by rank or order?

What Percheron stallion is said to be the greatest that has existed so far?

ADVERTISING FOR SERVICE.

Many valuable stallions are never patronized, because their community does not know they exist. In this modern age it is necessary to do more or less advertising. One of the cheapest and most complete methods of advertising is with postal cards. The breeder should spend considerable time getting a complete list of the names and addresses of the owners of mares in his vicinity. Most every breeder is acquainted for miles in every direction. He can run his mind up and down one road and then the other through the entire community, and not skip any of the inhabitants that own mares. After his acquaintance has been exhausted, he can enter into conversation with those living as far out as possible and secure many names from them. Those who have stallions for public service, that do not command the shipment of mares to them, can easily get the names and addresses of five hundred or more mare owners. Prepare reading matter for a postal card in typewriter type so there will be room at the bottom for a written signature. Anyone connected with the family can sign the owner's name to these cards, then address them. These will be read carefully by nearly everyone receiving a card. This is direct advertising and covers the territory completely. The first card should be an introduction. The next one should be some particular features about the breeding stock. Other cards can be prepared if necessary. A few dollars spent in this direction will usually get excellent results. This method of local advertising has been tried by the breeders, and found very profitable.

A Breton stallion in France. A compact horse with some action, weighing about 1,400 pounds. Several foreign countries buy these horses.

LAWS FOR COLLECTING SERVICE.

Numerous states have introduced laws giving a lien on mares and colts for eighteen months. We shall be pleased to have our readers notify us of the enactment of any of these laws. We would also appreciate a copy of the laws that have been passed. Numerous other legislations concerning stallions and jacks have been contemplated in the way of stallion inspection laws. We would also like to know of any new laws being enacted, or any old ones being changed.

Stallions and Mares

At Bargain Prices

PERCHERONS, BELGIANS and SHIRES

NINETY-EIGHT HEAD FROM WHICH TO SELECT.

Forty Percheron stallions 2 to 4 years old; blacks, greys and a few bays. All registered in the Percheron Society. Several of these two year old will now weigh from 1800 to 1950. Price $500 to $1000. Three a little higher.

Fifteen Belgian stallions, 2 to 5 years old; bays and sorrels; two-year-olds that are weighing a ton. Price $500 to $1200.

Thirty Percheron mares, 2 to 8 years old; blacks, bays and greys. All registered in the Percheron Society; 22 showing heavy in foal. Price $300 to $700.

Ten head of Shire mares and stallions that I will sell at bargain prices. All of these stallions have been examined and found to be sound and of pure breeding, and certificate of such will go with each horse. If you want a real bargain in an imported or American bred stallion or mare, come right away as I mean business

L. R. WILEY, Emporia, Kans.

SEE OUR STALLIONS

BEFORE YOU BUY.

Percheron, Belgian and German Coach.

Our last importation arrived December 28. These with the select lot on hand enable us to offer for inspection at this time a great collection of stallions of strong individuality, rare quality and standard breed types. **There are yours at bed rock prices. OUR GUARANTEE is different** to that **offered by any other firm.** It will pay you to investigate it if you contemplate the purchase of a stallion.

Mention American Breeder when you write.

OLTMANNS BROS., Watseka, Ill.
Leer, Germany; N. Ft. Worth, Texas.

HOMEWOOD STOCK FARM

Percheron, Belgian, Shire Stallions and Mares

Now is the time to buy a good stallion or mare. We have the kind you have been looking for. Our horses arrived home in October and are now perfectly acclimated and in the best of condition to do you a lot of good.

The Percherons are two and three years old, with size, bone and draft horse quality—many of them weighing over a ton, and not fat.

Our mares are of the best brood type; all are in foal and plenty of ton mares to select from. Every animal guaranteed sound, and a satisfactory breeder. Others say we have the best bunch of two-year-old Percherons they ever saw; you will say the same. Come and see us or write for full particulars. You will find horses right, terms right and prices below others of equal merit. We have also a lot of big, heavy boned, American bred stallions at surprisingly low prices. Don't buy until you have seen our stock.

Homewood is on the main line of the Big Four and I. C. R. R., twenty-three miles south of Chicago. Trains hourly to and from the city.

S. METZ & SONS, Bell Phone, Homewood 58 W. Homewood, Ill.

PERCHERON, BELGIAN AND SHIRE STALLIONS

Imported and American Bred.

We have a fine lot of stallions with plenty of bone and weighing from 1,800 to 2,400 pounds each; 3 to 5 years old; good colors; good terms; good safe breeding guarantee, and a square deal.

Some extra good mares weighing from 1,800 to 2,100 pounds each, and in foal; 3 to 6 years old. Prices reasonable. See us before you buy. It won't take long or cost much. We can save you money. Barns in town.

JUNKENS & O'NEIL, 15 North Hazel St. DANVILLE, ILL.

WHITE OAK STOCK FARM

American bred Percheron Stallions and Mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to **D. Augstin, Carlock, Ill. R. F. D. No. 2.**

Carlock is on the L. E. & W. Ry., and thirty miles southeast of Peoria, ten miles northwest of Bloomington, Illinois.

"AMERICAN BRED PERCHERONS"

Anthon 25137 (45446) by Besique (19602), at head of herd. We have on hand several fillies and stud colts sired by Gouveneur 55323 (70200), for sale. Also a black stallion of fine quality coming three years old in July, for sale. Come and get a colt where you can see the sire and dam. Onarga is eighty-four miles south of Chicago on the I. C. R. R., and about seventy-five miles east of Peoria.

H. KNOCHE & SONS, Onarga, Ill., R.F.D. No. 2

NORTH & ROBINSON CO.

ANNUAL SALE OF
PERCHERONS, BELGIANS AND SHIRES
March 20 and 21, Grand Island Nebr.

65 HEAD OF PERCHERON, BELGIAN AND SHIRE STALLIONS AND MARES

25 stallions from one to six years of age.

Matured stallions, ranging in weight from 1,800 pounds to 2,200 pounds each, with plenty of bone and good conformation.

A great many of these young stallions were raised on our ranch at Bridgeport, Neb., where they had thousands of acres to roam on, at will, where they could develop as nature intended.

COMBINED WEIGHT OF THESE MARES, 11,200 POUNDS.
Every One of These Mares is a First Prize Winner. All Will be Sold in This Sale.

Buy one of these horses and you will get a breeder. We sell our horses with a 60 per cent breeding guarantee. It is safe to guarantee these ranch raised horses.

The two year old stallion, Adelbert 80959, sired by the champion, Olbert 42815 (53109). Seventy-two of his get have won first and sweepstake prizes. A great many good horse men think Adelbert will develop into a bigger and better individual than his sire. Adelbert now weighs 2,050 pounds and is not burdened with fat. His dam is Victoria 60669, by Philbert (44290).

There will be a great many young stallions in this sale that are good enough to head any herd.

We have the heaviest and best bunch of mares that were ever sold in an auction ring. There will be 12 mares in this sale that will weigh 16 tons. We are selling these mares as an advertising medium, to establish the fact that we are breeding and raising some of the best horses in the world.

Secretary Wayne Dinsmore of the Percheron Society of America, has informed us that he will attend this sale and would be pleased to meet the Western breeders there.

There will be eight head of good Shire mares sold in this sale. Send for catalogue, mentioning the American Breeder.

NORTH & ROBINSON CO.

COL. Z. S. BRANSON, Auctioneer **GRAND ISLAND, NEBRASKA**

Angus for sale include one T. Erica and six Queen Mother bulls, from 8 to 15 months old. Prices reasonable. **Marco B. Walker, Mgr. Cold Brook Stock Farm, Clarinda, Iowa.**

QUESTIONS AND ANSWERS.

(Contined from page 8).

the on coming permanent teeth that should take their place. This condition will give rise to a swelling along the roots of the molars involved and will sometimes cause an abscess to break on the surface below the eyes. Ordinarily this condition can be removed by an occasional application of some good blistering agent. For this purpose take one-half ounce of powdered cantharides and one dram of biniodide of mercury and mix with four ounces of lard. Rub the mixture well into the hair over the parts affected and tie the animal so it cannot disturb the parts by rubbing. Allow to remain on 24 hours, then wash off with warm water and soap and when dry grease occasionally to keep parts soft. Repeat the blister in two or three weeks.

"HINNIES"—I would like to ask your opinion on breeding the small Spanish jennets to a Percheron stallion by the artificial method.—Illinois Subscriber.

REPLY:—This can successfully be done with the capsule system. You will see full directions in this paper how to use the capsules. We will be glad to answer any questions on this subject in a later issue.

SUSPECTED THROMBUS—I have a gelding 16 years old that has been in poor condition for two years and I have given him the easy end in an effort to keep him going until I have a colt ready to take his place. However, about two months ago we were using him to haul earth and had about 1200 pounds on; had to cross a sandy stretch of road. This horse held his end up and took his share all the way to the barn, but as soon as he stopped he raised his hind leg and appeared to be in so much pain that he could not touch the foot to the ground. We turned him to pasture and he seemed to improve. Recently we have used him on short runs in the buggy. He travels all right but as soon as stopped raises his foot off the ground. Now the leg first affected does not bother him but it has gone to the other hind leg exactly as before, save that one occasion the large muscle of the thigh, especially close to the stifle, on both legs, began to tremble violently and did so for several minutes. After coming in after a short, slow trip today the pain was great enough to cause him to sweat. Please advise as far as possible as to cause and treatment.—Washington Subscriber.

REPLY:—The symptoms you describe correspond closely with those a horse exhibits when the circulation is interfered with through the posterior limbs. The difficulty is usually occasioned by a form of blood clot developing in some of the arteries that supply these parts, and when the animal is submitted to exercise that is beyond what the plugged vessel can normally furnished the muscles used, lameness results. An animal so affected rarely shows lameness when walking leisurely about, but when put to work, especially if trotted or galloped, they often suffer great distress. There is no cure, but for your own satisfaction, you should have a veterinarian acquainted with the anatomy of the parts make a careful rectal examination for the purpose of ascertaining whether or not the suspected condition is present.

FEEDING MARES ALFALFA—Is it considered dangerous to feed a mare alfalfa hay when in foal?—Missouri Subscriber.

REPLY:—Mares may be fed some alfalfa, but the principal part of the forage should be made up of other roughness. One-third or a half of the feed may be alfalfa, but it must be fed sparingly to begin with, as a rule. Do not allow them to have all they want at any time, as horses of any kind can be founded on alfalfa; it also makes the bowels very loose and works on the kidneys severely.

LAME MARE—A gray mare 7 years old in foal got kicked by her mate some six weeks ago. The trouble seems to be in the hoof; it swells above and down to the foot; a small opening came and I had the best man I could get to do something for it, but it is still sore; not any sign of opening, only swollen. She is not much lame on it.—South Dakota Subscriber.

REPLY:—Soak the foot and lower part of the limb in water as hot as the animal can comfortably bear it for 30 minutes three times a day for two days, and during the interval keep the part well wrapped in cloths which keep wet with the hot water. At the expiration of the second day permit the parts to become dry, clip the hair from over the affected part and rub in a cantharides blister. Prepare the blister by mixing one ounce of powdered cantharides with four ounces of vaseline. Tie the animal so it cannot rub the parts with its nose for 24 hours, then remove the blister with warm water and soap. When dry apply a little vaseline every one or two days to keep the parts moist. Repeat the blister in three weeks if necessary.

BEST TIME TO BREED—Please discuss heat periods and length of time

RHEA BROTHERS
ACCLIMATED PERCHERONS

We have 40 head of stallions on hand today. Ages from coming two to five years. The older horses weigh from 1,900 to 2,200 pounds and are not loaded down with fat.

These stallions have been raised in the open fields and are acclimated and will breed from the start. You cannot over-estimate the importance of acclimation—it means much to you.

Our horses have more bone than is usually found among Percherons, and they are clean jointed and sound.

We are offering stallions at very reasonable prices, far below what the same class of horses are usually quoted; but we raise them here on the farm; raise our feed and can afford to sell cheaper than others not so favorably situated.

Every stallion fully guaranteed. Life insurance furnished at cost if desired. If interested in Percherons we ask you to come and see us or write today. References—Packers Nat'l Bank, So. Omaha; Arlington State and First Nat'l Bank of Arlington, and the Citizens State Bank of Blair, Neb.

Arlington is on the main line of C. & N. W. R. R., 34 miles northwest of Omaha, 55 miles north of Lincoln, and eight miles east of Fremont. We have 12 passenger trains every day. ***ARLINGTON, NEBRASKA***

PARAMOUNT STOCK FARM
BREEDS AND IMPORTS
PERCHERONS, BELGIANS AND SHIRES

My November importation is ready for business. My two year olds are weighing 1,860 to 2,000 pounds; three year olds and over, 1,900 to 2,250 pounds. They are high class and sound. I am making prices that sell. I will pay any man's expenses that can say he is disappointed in the size and quality of my horses. Seventy-five head to select from. Write your wants. Send 10 cents in stamps for large picture of the horse parade.

Experienced Groom Wanted.

WM. CROWNOVER **Hudson, Iowa**

IMPORTED PERCHERONS AND BELGIANS

I have a lot of the best specimens of the two leading breeds. I have personally selected them carefully for big bone, with quality, style, action and breeding, with weight from 1800 to 2200 pounds. I give a gilt edge guarantee, good for two years, with every horse. I am going to sell them down very cheap, considering the quality. Barns are four blocks from A. T. & S. F. depot.

W. H. RICHARDS, D. V. S.

EMPORIA, KANSAS

A. A. FIRKINS. **J. E. PARK.**

PERCHERON STALLIONS AND MAMMOTH JACKS

Our stallions are all blacks and grays; all young; sound and ready for service. Some ton three year olds, as good as grow. All registered in P. S. of A.

Our Mammoth jacks are Kentucky and Missouri bred; all blacks with light points; all two years old and over; all registered and every one has size and quality; all broke to service. We give a liberal guarantee with all stock. Come and see us or write. Barns in town; 50 miles north of Kansas City and 35 miles east of St. Joe on Rock Island and Burlington.

FIRKINS & PARK, CAMERON, MO.

FOR SALE 300

200 Percheron stallions;
100 Percheron mares;
all ages and prices (50 herd headers.)
Singmaster & Sons, Keota, Keokuk County, Ia.

IMPORTED BELGIAN STALLION
for sale or exchange. Seven years old; dark dapple chestnut; sound, active; weight about 2,200 pounds, with lots of bone and quality. Sired by the champion stallion of Belgium. Would trade for an imported Percheron stalloan; black; as heavy as mine and with as much bone and quality, that is sound and a good breeder; not over seven or eight years old and within two to three hundred miles of Chicago. Or would sell my horse for cash. Reason for changing, have all Belgians and need a Percheron. Address **Box 369, Lockport, Ill.**

IMPORTED PERCHERON STALLIONS, JACKS AND JENNETS

For SALE—5 imported black Percheron stallions, 4 to 6 years old; all tried and regular breeders; can show colts; weigh 1,800 to 2,200 pounds. One Morgan stallion, 7 years old. 10 large black jacks, 2 to 7 years old, all broke; good performers; can show colts and mares in foal. 10 head big black jennets, all bred to our imported jack. Prices reasonable. Write or come to farm 4 miles from Raymond or Chase. Our horses and jacks were shown at the Kansas State Fair at Hutchinson, September, 1912, in six different classes, and won in every class. Come and see us. **J. P. and M. H. MALONE, CHASE, KANSAS.**

R. L. HARRIMAN, Bunceton, Mo.

The Fine Horse and Jack Auctioneer of the West

I sell more horses and jacks than all others. Terms always right: work always up to the highest standard.

Draft and Coach Stallions

A fine bunch of Percheron, Belgian, French Draft and Coach stallions for sale; priced from $350 up. I have the big ton kind that are right. Come and see me, or write. **J. M. Nolan, Paola, Miami County, Kas.**

REAL ESTATE.

Full young bearing orchard and fruits; hedges; groves and alfalfa. $6,500 cash or payments, or will take part in stock. Address **Owner, Box 257, Waukomis, Okla.**

before the semen that is in the mare can take effect; proper time to take mare to horse, and how to take her?—Nebraska Subscriber.

REPLY:—The best time to breed mares that are in a healthy condition is just as the heat period is closing. The mares having a large, open womb, not caused by a diseased condition, can quite frequently be fertilized about two days after the heat period closes, by being bred with the capsules. Mares can be successfully bred that are not in heat. The egg from the mare is not usually liberated from the ova until two to five days after the heat period has passed. The sooner after the heat period terminates the better results will be had. The semen will live in a healthy mare a great many days, as a rule. The best way to take mares to the stallion is to lead them slowly to the stallion and take them home the same way. Better results will be had from breeding in the evening and not exert the mare after that time and allowing her to get a good night's rest.

INJURED FETLOCK—I have a mare 7 years old that sprained her fetlock joint this past fall and it swelled to twice its natural size. She is very lame on it. Can anything be done for her?—South Dakota Subscriber.

REPLY:—Cases of this kind that have been permitted to become chronic are very slow to recover under any treatment. We would recommend that a judicious use of the firing iron be made in this case which should be done by a veterinarian skilled in the use of this appliance. It frequently happens that treatment of this kind restores some bad and worthless cases to useful service.

CHANGING CLIMATES—What would be best to give a stallion that has been shipped from a distance, to assist in getting him ready for the breeding season, as sometimes a change of climate affects animals a good deal?—North Dakota Subscriber.

REPLY:—Arrange to have exactly the same kind of feed that the stallion had in his old home; feed it just as near as you can like he received it before coming to your section, no matter what the cost of the feed may be; if you expect to get good results it should be profitable to arrange for this particular kind of feed. If the water in your section is not exactly like he has been used to, we would advise giving him cistern water that has been well filtered. Watch his bowels and keep them in good shape; give him a reasonable amount of exercise so as to keep him in a good physical condition. This thing of changing climate is largely in the feed and water. We would not advise making too many services this season. Use the misroscope so that you will know when your stallion is not giving good results. When no live spermatozoa are discharged do not use him for a day or two; give him a chance to recuperate. If your feed is constipating the animal, give him a little glauber salts; begin with one teaspoonful in the feed, gradually increase it until you get the desired results.

OBSTRUCTED BREATHING—I have an 8-year-old Standard bred stallion that is very speedy. When he is driven at a 3-minute clip his wind is apparently good, but when he is driven faster than this he pulls much more on the bits, causing him to bow his neck and make a noise like a roarer. Is he a roarer and will the roaring operation accomplish a cure? He is valuable for racing purposes if he can be cured.—Ohio Subscriber.

REPLY:—Your horse may or may not be a roarer. Why not apply a form of bit held in place by means of an overcheck that holds his nose out and prevents his curving his neck in the manner you describe? Such bits are on the market and may be procured of almost any dealer in turf goods.

SEMEN IN THE UTERUS—I just started to use the capsules when my horse got hurt—it was the first part of May. I had just tried it on four or five mares and two I could get the semen from, and in the others there was none to get, it had all gotten into the womb before I could get it, so I could not get it out of the womb. The neck of the womb in these mares was long and open quite large and I suppose there isn't any way to prevent it.—Ohio Subscriber.

REPLY:—It is easier to get the semen out of the womb of a mare than it is out of the vagina with the Carlson Semen Extractor, after you practice a little. That has been the great difficulty in artificial breeding until this instrument was introduced. You should read the directions on capsule breeding in this issue.

BREAKING YOUNG JACKS—I have a young jack nine months old and am just weaning it. Will it be all right to let him run with the mares and mules until spring, or will it ruin him? In the spring I am going to put him in a pasture to himself with young mares.—Mississippi Subscriber.

REPLY:—You should have weaned this jack at six or seven months of age and taken it away from all long eared animals. Since you have not done that, we would advise you to do it immediately. Place him in a pasture with a filly colt younger than the jack; one that will not fight, so that he can tease it and play with it all he wants to and not be afrail of getting hurt. Do not put him in the pasture with grown horses, for if some of the mares should make a dive at him, or give him a right good whipping, he is liable to be afraid of them for a long time. You should place in the pasture or enclosure, a self-feeder and fill it with oats and bran, equal parts, so that the jack and his associate can have all the grain they want. If the jack has not done well we would advise teaching him to drink cow's milk; give it to him fresh from the cow until he rounds into good form. As valuable as this jack is supposed to be one can well afford to spend a few dollars in milk for this animal. They soon learn to drink cow's milk and grow rapidly. During this process it is advisable to break the jack to lead so that he may be taken anywhere and not be afraid of the many different sights, then when he is expected to make a service, if some peculiar sight comes into his view, it will not make so much difference. It is not much wonder that jacks are very curious; most of them are placed in a dark dungeon when they are weaned and never have an opportunity to see anything. If jack colts could be tied on a thoroughfare, where they would see all kinds of sights except jacks, jennets and mules, when weaned at six or seven months of age, and kept where they could see these objects until they were 15 or 18 months of age, it would be a good plan, as a rule. Or, they might be

Ready for a trotting race on the turf at Paris. The horses are ridden—no sulkies used. American horses are often seen there.

SADDLERS.

40 saddle stallions, mares, colts and fillies of the best Denmark and Chief breeding. Special prices on stallions for the next 30 days. **J. F. Cook, Lexington, Ky.**

EXCELSIOR SHETLAND PONY FARM.

GERMAN COACH STALLION

For sale or exchange; registered; black; 11 years old; weight 1450 lbs. An extra good breeder, but needs changing. **John M. Walker, Nineveh, Indiana. Route 2.**

SADDLERS FOR SALE.

Thirty head of high class stallions at very low prices for next 30 days. Also services of Foss McDonald Eastern Cloud and others. **H. A. Greenwell, Lakenan, Monroe County, Mo.**

SADDLE STALLIONS AND JACKS

On account of age and failing health I am closing out my stable of high class saddle stallions and jacks. For individuals and breeding they are unsurpassed. If you want a bargain write **J. E. Bradley Carthage, Jasper County, Mo.**

KENTUCKY STALLIONS

For sale cheap; one 7 years old, 16.1 hands high, weight 1235, gentle for lady to drive, sure foal getter; colts to show; easy to handle.

One coming 3; 16 hands high. Both sound as a bullet. Reason for selling, want to quit the business; got more work than I can do. If you want a good one cheap, write to **Tom J. Hallmark, Curdsville, Daviess County, Ky.**

BARHAM, SON & BUTLER

(The Home of Star McDonald 1712.)

At Milan, Tenn.

Will sell high class registered saddle horses, also a few large fine jacks at auction, March 19 and 20. Nearly all their consignments are from Kentucky, and the very best; many of them premium winners at Kentucky's best fairs. Write them for catalogue.

This firm keeps constantly on hand for sale at any time registered saddle horses and fine jacks. They have won more premiums than any stable in Tennessee on saddlers.

They are also large handlers of cow peas.

REGISTERED STALLION.

Standard, bred, for sale. Allen Vincent (54073); beautiful blood bay; 16 hands; weight 1135; foaled 1905; trotter; fine style and action; kind and well trained. Sure foal getter; colts to show. First prize over all stallions at Ouchita Valley District Fair 1912. **H. A. Dean, Camden, Ouachita County, Arkansas.**

REGISTERED MORGAN HORSES.

My Morgans are large; 15 to 16 16 hands and 1,050 to 1,300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted. Weanlings to 3 years old for sale by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. **Richard Sellman, Rochelle, McCulloch County, Texas.**

MORGAN HORSE

To sell. A bay stallion foaled September 24, 1911, sired by Prophet (5112), he by Poem 4159; dam Barbara sired by Logan L. 12059; he by Addamed Allen 11638; he by Ethan Allen 473; he by Ethan Allen 43; he by Black Hawk 5. This colt has one white ankle. When matured will make a 15.3 horse and will weigh 1150 or better. He is inbred; his sire was sired by Poem 4159; dam Baby sired by Logan L. Prophet was got by Baby so this colt is by Prophet and Baby. Will sell him for $175. **L. A. Flint, Wabash, Ind. Route 2, Box 77.**

SAPPINGTON & BROCKMAN

Will sell on March 18, rain or shine, in sale barn in Centralia, Mo., their entire breeding stock consisting of

30 head of stallions, saddlers, trotters and drafters; also jacks from six months to seven years and jennets as good as grow with foal and with jack colts by side. No culls. This is good, clean stock. No cull sale, but a clean, honest sale of good stuff from breeders first hand. All stock registered.

Catalogues will be ready March 1st. Write to

Dr. J. Sappington, Centralia, Mo.

led out where they could see these different objects, which would also make them more easy to handle. Jacks, as a rule, are a little stubborn in disposition, and when they have never had an opportunity to come in contact with the outside world, it only adds to the difficulty. There is very little use for anyone ever having a slow jack if he is handled right from weaning time on, and properly broken, then not allowed to serve a jennet or become infatuated with any long eared animals until he has reached the age of five or six years. There are thousands of our best jacks ruined every year by neglect. We would naturally think that anyone owning a good jack colt, with the prospective value from $1,000 to $2,000, could afford to spend just a little time in preparation rather than to have an animal that is usually worthless. There is nothing more disgusting than a jack that some man is responsible for making a failure of.

ANOTHER CROOKED JACK COLT—I had a very fine jack colt come in May; was straight and nice and measured 40 inches high. I kept jennet and colt up until she was rebred and in foal; about the first of July I took them off to pasture and did not see them until about November. When taken up the colt was so crooked its knees were most together and feet stood out; looked as though its legs had been broken. I offered it to anyone that would take it away, but no one wanted it, but now don't think it is so bad. Doctor says it was caused by getting down to eat grass and spreading its legs. It is still running with the jennets. Can I do anything for it or will it get straight again?—Kansas Subscriber.

REPLY:—There is very little use to have these crooked colts. The proper thing to do when this condition is noticed is to take the colt off of the pasture and teach it to drink cow's milk. As soon as it will drink sufficient milk, wean the colt and teach it to eat oats, but continue the milk diet. Have its feed box and manger high enough so that it will not be necessary to reach down after anything. Nature usually does the rest.

AMERICAN PERCHERON REGISTRY ASSOCIATION—Please give me your opinion on the breeding of the stallion (bay) Hampton or Hamton 7238, registered in the American Percheron Registry Association. Is this association in good standing?—Texas Subscriber.

REPLY:—This registry association is not recognized by the leading Percheron breeders, and we would consider that this certificate has little value unless this stallion can be registered in the Percheron Society of America, Wayne Dinsmore, Secy., Chicago, Ill., or the Importers & Breeders Percheron Society at Plainfield, Ohio, John Forney, Secy.

DIAGNOSING PREGNANCY—I have a mare that throws a whitish fluid every time she backs or goes into collar. She was bred only once. Is it possible for her to be in foal? She looks big enough and several neighbors say she is in foal. Is there any way I can tell for sure?—Alberta, Canada, Subscriber.

REPLY:—The discharge complained of may be from the vagina and your mare may be in foal. The best way to tell whether she is pregnant or not is by making a rectal examination. Exploration in the vagina might cause an abortion, and is dangerous unless a speculum is used.

A JENNET JACK—I am most interested in raising mules and jacks. I have about 45 good mares and jennets. Please tell me in an issue of your paper if you know of anything that will change a jennet jack into a mare jack. I have had him separated from jennets for eighteen months. I have had another jack cover the mare first; I have put the urine of a jennet on the mare, and I have let him see a jennet, but all to no purpose. The jack is 9 years old and has always been used with jennets. He is very gentle and quiet with all animals except jack jennets and mules, those he will eat up, but mares, stallions and geldings he pays no attention to.—West India Subscriber.

REPLY:—We do not believe that you will have much, if any, success making a mare jack out of this individual. He is too old; he has associated with jennets too long; his early training was not properly given. There is one thing that you can do if you have sufficient jennets so that you can have one to make a service on at any time, and that is to adopt the capsule system. You can serve a jennet and take the semen from her and breed the mares with capsules. This is about the only relief that we can give you.

SCIENTIFIC BREEDING SCHOOL—Please let me know when another term of the Scientific Breeding School will be held.—Montana Subscriber.

REPLY:—The next term will probably be held in August or December. It will be known then as an advanced course in scientific horse breeding.

INJURED STALLION—I have a coming 3-year-old half Belgian horse that fell on the ice a few days ago and threw his hip out of joint. Can anything be done for him?—Colorado Subscriber.

REPLY:—If what you say relative to the nature of the injury is true it is likely your horse will not recover from his lameness. We are inclined to doubt the correctness of your diagnosis. Have you had a good veterinarian examine the case? If not, do not delay.

TOO MANY SERVICES—I have a jack that is coming 4 years old; was shipped from the north last fall and I bred about eighty mares to him last spring and will not get but few colts. He was in right good shape when I got him and he did well all the time—in fact, mended all the time. I let him serve one mare a day. He worked fine but when he came off there was a watery, frothy stuff came from him most of the time, but sometimes there was a little discharge that looked all right. Once I let him serve a mare four times in not over twenty minutes to see what he would do. I don't think he comes right by doing that way. I fed him all the oats and alfalfa hay he would eat; he is now almost fat. Could you tell me anything to do for him?—Texas Subscriber.

REPLY:—We may not be able to help you with this jack, but if you purchase another one, you will profit by the past lesson. You have made too many services. A three-year-old jack should not make over 40 services during one breeding season. Diminish the alfalfa; make the roughness part corn fodder unless you can get good prairie hay. Limit the services to one mare a day during this coming breeding season. If you have a large number of mares to breed, adopt the capsule system.

ABORTION DESIRED—I have a full blooded mare that during heat a scrub colt got to her and served her. Is there anything I can do to make her come in heat again (if she does not) so I can breed her to a good horse this spring?—North Dakota Subscriber.

REPLY:—It is not a safe proposition to resort to practices that will excite abortion in the mare.

MILLET HAY FOR STALLIONS—I have two stallions, one pure bred and the other a grade. What would you state about the feeding of millet hay to the stallions in the breeding season. My millet was cut in good time for hay; very little of the seed matured—scarcely any.—Kansas Subscriber.

REPLY:—If millet hay is cut real early, and well cured, without any moisture, a little of it may be fed to horses, but great care must be taken not to feed it in large quantities. Ordinarily it is not advisable to feed millet hay to horses, more especially after it is ripened. In your case we would not advise you to feed millet hay to valuable horses that are not taking much exercise, unless it is an absolute necessity.

SPOILED UDDER—A neighbor has a young mare that developed a "spoiled bag" with her first foal. One-half of the udder only was affected; that half was lanced and broke and run a number of times. This occurred in 1911. The udder feels all right now. Would it be safe to breed this mare again?—Colorado Subscriber.

REPLY:—As a rule whenever a part of the udder has been injured by inflammation as described, it is a source of trouble at each subsequent foaling period. There usually remains on the diseased gland some cells that become aroused in milk secretion and trouble results. Oftentimes these conditions can be considerably controlled by feeding in a manner so as to not stimulate too great a milk flow early, and by applying agents to the parts that will help check the inflammation that so frequently develops.

BEST METHOD OF ARTIFICIAL BREEDING—Which method of artificial breeding is the best, using the breeders' bag on the horse and then use the impregnator, or the complete capsule system?—West Virginia Subscriber.

REPLY:—There is only one successful way of artificial breeding and that is by the capsule system. Breeders' bags injure stallions and jacks; neither is that plan successful. A few colts may be obtained in that manner, but the per cent will always be small. There is no way of keeping the bulb impregnator at the right temperature, neither will it stand boiling any length of time. Read the directions in this issue on capsule breeding.

STRANGLES—All of my horses and colts have had the distemper this winter—most of them catch it within seven or eight days after they are exposed—it stays with them about a week or ten days, when they seem to feel as good as ever. The yearlings, twos and threes that we brought from Iowa to Boulder, Wyo., this spring all broke under the jaw and ran water. What can I do to keep the outside horses from catching it in the spring when I bring them in to work or breed? Some of these mares that have had it will foal in April and I may have to put

LaFAYETTE STOCK FARM

HIGGINSVILLE, MO.

J. T. Watson, New London, Ralls County, Mo.

FOR SALE OR EXCHANGE.

Kentucky Rex 1467; color bay; sired by Rex McDonald; dam, Maggie King by the famous old Forest King.

One imported Belgian; 12 years old; color bay; has weighed 2,210 pounds. This stallion is the surest draft stallion I ever saw. Has colts out of 1,100 mares that weigh 1,500 to 1,600; sired colts out of 1,400 mares that have weighed 1,870. This stallion has stood here six seasons; fillies in the way.

One Mammoth jack 14½ hands high; black, white points; quick server; extra breeder; lots of bone; length and body. I want a Belgian stallion and a good jack I can use on my jennets. Big, smooth; any color; want quality and breeding.

The above stock are all sure and good breeders. Will guarantee as represented. Books and colts to show. **O. T. Karr, Quitman, Nodaway County, Mo.**

A $1,000 JACK TO TRADE

A big, full made black jack with white points; 15 hands standard; six years old, for two good young draft mares in foal. Clydesdale preferred. Tell it all in first letter. **Enos Hayes, Elizabethtown, Hamilton County, Ohio.**

Two Jacks for Sale

One two year old; black with white points, by Taxpayer, Jr.; dam a Leon jennet. Will make a splendid jack.

Also black jack with white points; coming five years old; 15 hands high standard. Good head and ear; good length and a fine breeder. For photos and prices address, **Mullins Bros., Lynnville, Tenn. Rte. 3.**

Jack Wanted
To Stand

I want a jack to stand on shares with privilege of buying. Must be a good one; 15½ hands and weigh 1,100 pounds. References, Farmer-Merchant Bank, Wright City Bank, Wright City, Mo. **F. R. Ober, Wright City, Mo.**

MAMMOTH JACK

for sale. Black with white points; six years old; extra heavy bone and body; 15 hands standard; good server and sure. Am selling only because I expect to leave state. This is absolutely one of the good kind. For further information, address **T. E. Johnson, Hindsville, Madison County, Ark.**

JACK TO STAND WANTED.

I want to stand a good registered jack with view of buying. Must not be less than 15½ hands and weigh 1000 pounds, and not less than four or five years old—not much over. Black with white points wanted. Can do a good business; no jack around here. I would trade a black draft Percheron; would weigh 1900 pounds in fair flesh; 8 years old; sure foal getter. Good colts to show. Can give plenty of good references. **W. F. Yost, Swanton, Saline County, Neb.**

BLACK JACK COLT

For sale; 54½ inches tall; age 16 months. Sired by $1,000 jack that weighs 1100 pounds. Related to Monsees' Orphan Boy. Price $200. **W. W. Strock, Pierpont, Ashtabula County, O.**

FOUR JACKS FOR SALE.

One jack, black with white points; 16 hands standard; foaled June 16, 1908, register No. 3081. Brown jack 15 hands, extra heavy bone and body; good head and ear; foaled September 4, 1909. Black jack with white points; 15.3 hands; foaled 1903; extra breeder. A good, quick server with jennet. Extra good jack colt foaled June 12, 1912; height 54 inches; extra good head and ear, with plenty of bone and body. Sire register No. 3081; dam register No. 1603. This will make an extra good jack. **W. W. Downing, Hawk Point, Lincoln County, Mo.**

JACK STOCK AND PERCHERONS WANTED.

I will purchase, if price is right, a Percheron stallion and mares; a good jack and jennets, or will trade Oklahoma farm land. **Geo. H. Dodson, Oklahoma City, Okla.**

BLACK JACK

for sale. Three years old; 15½ hands standard; guaranteed sound and a foal getter; quick performer on mares. Can be bought right. **J. T. Richardson, Guilford, Nodaway County, Mo.**

JACKS AND JENNETS

for sale. Ten jacks and eight jennets of my own breeding. Can sell them worth the money. **H. A. Schwatken, Hammond, Bourbon County, Kas.**

KINGFISHER VALLEY JACK FARM.

50 registered, big boned, heavy bodied black jacks and jennets, from colts to 16 hands. Best breeding. Prices and terms right. **J. H. Smith, Kingfisher, Okla., R. 3, Box 17.**

them in the barns or sheds where the distemper horses have been running. Will the colts get it? How can I prevent it. Of course if the weather is nice I will let the mares run in the pasture. Please answer in full as it may do others good.—Wyoming Subscriber.

REPLY:—Strangles is a difficult disease to ward off except by vaccinating against it. We understand that there has been rather recently developed a vaccine that has proven quite effective in preventing this disease. Write to Dr. A. T. Kinsley, 1426 Lydia Ave., Kansas City, Mo., for further information regarding this.

HABITUAL ABORTION—Three years ago this coming spring I bought a 3-year-old mare which was in foal—she was a range mare—and was very poor. When she foaled she was bred the

A Mulassiere mare with a mule colt sired by a Poitou jack, on exhibition at the Paris show.

ninth day; tried 21, 28, 35 and 42 days; then later on she was bred, and again the 21st day. Winter came and she filled out as if she was in foal but all at once she gaunted up. This last summer she was the same way; I thought she was in foal two different times, but she is not. Is this habitual abortion? What shall I give her, blackhaw or carbolic acid, mentioned in January 20 and May 30 issues? or give her the barren mare treatment which is in April 5 number?—Idaho Subscriber.

REPLY:—If this mare is not in foal use the iodine treatment on her and let her go until next fall without breeding her. Change the date so that the abortion will come at a different time; then watch her closely and if the udder begins to fill, use the black haw treatment.

COW FAILS IN MILK—I have a cow that freshened (perhaps before time) and she has no milk now. She has been fed well; is in good flesh and strong. Fed four quarts twice a day of equal parts of mill feed, ground barley and ground rye, with millet hay for roughage.—North Dakota Subscriber.

REPLY:—Your cow is losing her milking properties and is putting the feed on her back instead of into the milk pail. Now that she has progressed this far, better encourage her in it and send her to the butchers. When starting again do not feed rations so rich in fat. More alfalfa or clover with bran would be better.

SALINE SOLUTION—I see by the last issue that you recommend saline solution for old mares. What is it composed of and how used?—Illinois Subscriber.

REPLY:—This treatment will be given in the April 5th, barren mare edition. The saline solution is composed of salt and water, but there are a lot of other things connected with this that are necessary in using it. This will all be made plain in the April 5th issue; that will be soon enough for you to begin on your mares.
